There is no little interest in examining the weights and measures of earlier civilization, but these were so sporadic and diverse as to serve no scientific purpose. Modern civilization bringing widening commerce found the diversity of systems and orders a constant hindrance. Statesmen, thoughtful men in commerce, men of science, saw how valuable would be some definite standards and uniform systems. Modifications of national scales were attempted, but they touched but slightly the general life. Not until late in the eighteenth century was the effort begun for some universal system. This was in France, where it has full lodgment, with a foothold in other countries. The authors of this work bring together the salient points of the story, and give a clear view of the present effort to unify the system in all civilized countries. The effort was from its inception French, having its earliest impulse in 1670 from Gabriel Mouton, of Lyons. Tho there was much discussion the movement was slow. It is noticeable how leaders of society and in politics, as well as great men in science and in business, gave active, earnest support. In 1790, Talleyrand urged the reform upon the French Assembly, and great mathematicians, as Delambre, Lagrange, Laplace, Monge from the French Academy took part in the work. It was a great work, involving clear scientific conception, accurate observation, with minute appreciation of practical demands. The system did not find complete adoption even in France until 1837. Its merits were at once marked, and other nations began movements toward its adoption. Its use on certain lines was legalized nearly everywhere. The difficulty of its adoption by the mass of the people was seemingly very great, and governments shrank from it. Some opposed it with vigor; others were passive in their opposition. The authors in the later discussion give the status of the metric system here, and advocate simply its fitness along various lines. An appendix showing equivalents in the metric system tabulate the facts. The work is an argument for the metric system, but it is not partisan. It is excellently handled and should have general attention; it should certainly be read by every Senator and Representative at Washington.

The Main Points: A Study in Christian Belief. By Charles Reynolds Brown. Boston: The Pilgrim Press. $1.25.

The Social Message of the Modern Pulpit. By Charles Reynolds Brown. New York: Charles Scribner's Sons. $1.25.

Dr. Brown, of Oakland, Cal., is a successful preacher and a forceful leader, and both his sermons on the "Main Points" of Christian belief and his Yale lectures on the minister and social questions exhibit markedly the qualities by virtue of which he has exerted strong influence in the direction of progressive and aggressive Christianity. He deals with problems in which people are interested in a bold, free manner,

but at the same time leaves no doubt but that he is thoroly evangelical in conviction and spirit. His Beecher lectures, in which he interprets the Book of Exodus as a sociological document, are of decided merit. With fine literary and homiletical skill he demonstrates both the value of expository preaching and also the present need of moral leadership in social effort, such as clergymen might supply. If all ministers were inspired with Dr. Brown's enthusiasm for social betterment, there would be none to doubt the usefulness of the Church in the work of social reconstruction.

Literary Notes

....The Rev. F. H. Woods, an Oxford scholar, contributes a mediating and irenic essay to the discussion of the mutual influence of religious faith and scientific investigation. The title is *For Faith and Science.* (New York: Longmans, Green & Co. $1.20.)

....The February number of the *A. L. A. Booklist* contains a list of the most important articles that have appeared on simplified spelling, together also with selected lists in general literature and boy's books. The *Booklist* is published at 34 Newbury street, Boston, and the subscription price has been raised from 50 cents to $1 a year.

....Prof. William M. Ramsay, author of several useful studies in early Church history, has collected a number of essays on the character of Paul, the authorship of the Acts, and early Christianity in Asia Minor, which have appeared in several British reviews, in a well illustrated volume entitled *Pauline and Other Studies.* (New York: A. C. Armstrong & Son, $3.00.)

....Dr. James S. Dennis's *Christian Missions and Social Progress* is completed in a third volume of 675 pages, which are crowded with information concerning the beneficent results of missions. The index alone occupies over a hundred pages. We note nearly forty references to articles which have appeared in THE INDEPENDENT. The work is published by the Fleming H. Revell Co. ($2.50).

....The heroes of a volume of *Hero Tales of Congregational History,* by Grace T. Davis, include such doughty champions of the faith as Captain Miles Standish and Elder William Brewster, and the practical, versatile man of affairs, Cyrus Hamlin. The story of how the latter missionary baked bread for the English army is one of the most interesting bits of biography we know, and the other stories, such as those of Eliot and Brainard, apostles to the Indians, ought to strengthen the hearts of our young people. (The Pilgrim Press, Boston.)

....We have several times called attention to *Everyman's Library,* edited by Ernest Rhys and published by E. P. Dutton & Co., New York, because it affords an opportunity to get standard authors at a very low price. The volumes are light, handy and neatly printed. In England they are sold at a shilling apiece. In this country the list price is 50 cents. On account of their low price they are much more useful than the stately and heavy editions of the classics with which we adorn our library shelves. It is much better to fill up one's satchel and coat pocket with these when going on a journey than to depend upon the literary taste of the railroad newsboy. All departments of literature are embraced in the series. In the line of religious books the following have been recently issued: Browne's *Religio Medici;* Butler's *The Analogy of Religion; Wesley's Journal* (4 vols.); Maurice's *Kingdom of Christ* (2 vols.); Robertson's *Sermons* (3 vols.); Latimer's *Sermons,* and Law's *Serious Call.*

Pebbles.

"EVE wasn't afraid of measles, was she?"
"No, she'd Adam."—*Yale Record.*

"WAS the earthquake scene realistic?"
"Sure, it brought *down* the house.—*Princeton Tiger.*

FIRST COMMUTER—What do you do with yourselves evenings, old man?
Second Commuter—I take the 5:03 train from the city.—*Puck.*

HE kissed her at the Beacon's dance—
He found it far from pleasing
To waken from his loving trance,
And find his right ear freezing.

"Oh, never mind," she spake in glee,
As off it fell in view,
"I'll keep it safe, and it shall be
A souven-ear of you!"
—*Harvard Lampoon.*

PLACID I am, content, serene;
I take my slab of gypsum bread,
And chunks of oleomargarine
Upon its tasteless sides I spread.
The egg I eat was never laid
By any cackling, feathered hen;
But from the Lord knows what 'tis made
In Newark by unfeathered men.
I wash my simple breakfast down
With fragrant chicory so cheap;
Or with the best black tea in town—
Dried willow-leaves—I calmly sleep.
But if from man's vile arts I flee
And drink pure water from the pump,
I gulp down infusoriæ,
And hideous rotatoriæ,
And wiggling polygastricæ,
And slimy diatomaceæ,
And hard-shelled orphryocerciæ,
And double-barreled kolpodæ,
Non-Loricated ambroeiliæ,
And various animalculæ
Of middle, high and low degree;
For nature just beats all creation
In multiplied adulteration.—*Science.*

Editorial

Complaints of Railway Officers

Railway officers, several of them representing companies quite recently indicted for unjust and unlawful discrimination, are complaining in public addresses about the hostility of the people toward the management of the business in which they are engaged. They assert that this hostility is unreasonable, altho at least one of them admits that it is not wholly without just cause. The most offensive manifestation of it at the present time, from their point of view, is the tendency of State legislatures to reduce passenger rates to 2 cents a mile, to create Railway Commissions where they do not already exist, and in other ways to restrain or regulate the railway companies.

It is probably true that a portion of the State railway legislation now pending has not been well considered and ought not to be completed. The 2-cent rate bills are due in part to the general protest against railway injustice and wrong, and in part to the withdrawal of passes. It has been said that by one company free transportation worth $1,000,000 a year was formerly given in Pennsylvania. In the present condition of human nature, the withdrawal of such privileges causes a desire on the part of a considerable number of persons that the company shall enjoy no pecuniary gain by reason of its action. This could have been foreseen. But it was unjust to the general public to give that transportation without price, and an approaching reduction of the rate by law is, in a way, punishment for the offense. Moreover, if a company now sells a thousand miles of transportation for $20, it is not oppressed when it is forced to sell transportation for short distances at the same rate.

There is no general movement in legislatures or elsewhere for a reduction of freight rates by law. On the other hand, there have recently been conferences of railway officers in the West to consider the question of increasing these rates, and in the East a committee will soon report upon the expediency of making a higher rate for carrying bituminous coal. The people remember that dividends were increased in 1906; they do not think that freight rates should be made higher now.

As for the causes of what railway officers call the unreasonable hostility of the public, is there any intelligent citizen who cannot name them? We observe that one of these officers, who has recently spoken at length on this subject, would have the public forget the wrong that has been done. It is Mr. Shonts who says:

> "There is no doubt that in the building up of these properties things have been done which, tho legally right, were morally wrong; but because they were legally right and cannot be legally disturbed, what is the use of exploiting them, when no result can be secured except to furnish material for the charlatan and the demagog and to intensify class bitterness?"

This kind of reasoning does not commend the railway interest to the people. Much has been done that was wrong legally as well as morally. A part of it can be, and ought to be, "legally disturbed." Scores of pending indictments, involving more than 10,000 separate charges, point to the method of disturbance. Many of the wrong acts were quite recently committed, and therefore are not easily forgotten. Even in the recent history of the organization over which Mr. Shonts now presides there have been transactions, such as very large increases of stock, which may have been "legally right," and which possibly cannot be "legally disturbed," but as to which there is a feeling of hostility in the city of New York. We suppose, however, that he had in mind not the municipal railways, but the great steam roads. The detection and exposure and punishment of their offenses does not "intensify class bitterness," unless he conceives of only two classes, one composed of railway capitalists and officers, and the other comprising the people.

It happens that what is called an unreasonable hostility has within the last two or three months been kept alive, and probably intensified, by disclosures as to the management and manipulation of the

Union Pacific system and its finances, by revelations about the fraudulent acquisition of coal lands by railroad companies in the mountain States, by evidence of oppression and of continuous violation of law in the railway companies' coal business there, and by an extraordinary list of appalling accidents in the passenger service.

These things are fresh in the public mind. The record of them is not dragged out from the past "to furnish material for the charlatan and the demagog." We wish to avoid expressing any general conclusion with respect to them which would be unjust, but some of these disclosures—considered in connection with others of an earlier date, with the accidents that have taken place, and with the recent and continuing failure of freight service in many parts of the country—suggest that in the management of certain companies there has been too much Wall Street and too little regard for the physical property of the corporations, too much speculative and personally profitable finance, and not enough honest railroad work.

It is the belief of hosts of people that the conditions thus suggested actually exist. To displace that belief and the distrust and indignation which preceded it by a feeling of respect for the management of our railways is the task to which the energies of railway capitalists and executive officers should be applied. If they prefer another course, the hostility of which they complain will become more formidable.

Penny Dreadfuls

THERE has been much discussion of late about the propriety of exploiting the private lives of all persons connected with a sensational episode as is done by the yellow journals, and the effects of spreading the knowledge of revolting and obscene details of crime thruout the community. We do not propose to discuss these questions here, but to consider one somewhat fundamental to these, that is the causes of the manifest popularity of this new journalistic method.

The serial feature story is really a new form of literature, having its own peculiar *technique* as distinct as that of the novel, the epic or the essay, and since it is now read by more people than all other forms of literature put together, its aims and methods are worth attention. Any narrative or reportorial writing on a newspaper is now called a "story," and rightly so, not because it is intentionally fictitious, but because it has adopted the art of the story teller in the description of daily occurrences. For the same reason the lighter and more picturesque class of histories and biographies are now called "stories." We have the "Story of Japan," the "Story of Lincoln" and the "Story of Standard Oil."

The feature story of the newspaper is a contemporary historical romance. It is based upon actual incidents and introduces real characters, but, as in the historical novel, these are selected solely with a view to their picturesqueness and by arrangement, suppression of tedious details, development of plot and introduction of contrasting elements, in short, by all the arts of the author or painter, the event described acquires a significance and interest far beyond its actual importance. All news periodicals, except the *Congressional Record,* deviate from truth in the same direction and so do all histories except bare chronicles and statistical reports. Even the best of our newspapers and magazines do not give a true picture of current events, because they necessarily give undue prominence to the abnormal, unusual and catastrophic. The yellow journals simply carry this to an extreme, and in their selection of the day's news disregard entirely the real relative importance of events and consider only their intrinsic or potential interest to the greatest number of readers.

People have often wondered why the *feuilleton* or daily serial which is regarded as an indispensable feature of French newspapers should not have become equally popular in this country. The reason is that we already have the *feuilleton,* only we run it at the top of the page instead of bottom. Either because he has a greater love of reality or less imagination the American reader demands a simulacrum of verisimilitude in his matutinal romance. Our newspaper "stories" are, however, not inferior to pure fiction in their literary art. A proof

of this was given a few years ago in Chicago where a newspaper was printing every day a chapter of one of the most absorbing of detective stories by one of the cleverest of romancers, "The Hound of the Baskervilles," by Conan Doyle. At the same time the paper was following out the clues leading to the discovery of the identity and the murderer of a girl whose body had been found in a vacant lot, and the real mystery story was obviously not inferior in interest to the fictional one.

When we read a continued story in a magazine our pleasure is modified by the subconscious feeling that the author is keeping us on nettles unnecessarily long. We are annoyed as when we listen to a stuttering man telling a story. We feel like saying to the author: "Tell right away how it came out. You know how all this muddle is going to be cleared up. Don't keep us in suspense any longer." Of course the author does not always know. Dickens tells of being in a bookstore when a customer was buying the latest part of "Little Dorrit," and he confesses to a sinking of the heart amounting to stage fright when he heard him wondering how the story was coming out, because the next part was not yet written and he himself did not know how it was coming out. But what frightened the author would have enhanced the interest of the reader if he had known of it. Now the great advantage of the newspaper serial of real life is that the writer of it does not know what the next chapter will be, and the reader knows that he does not know. It is a real mystery, the key to which is hidden in the only safe place in the world, the future.

The modern journalist has discovered that people are not much interested in the past, even in the recent past. Who of us has not picked up a paper and become intensely interested in reading some paragraph, and then on turning over the page and discovering that it was a year old felt a sudden decline of interest as decided as the fall from sharp to flat in the tone of a car-bell as one train passes another? The importance attached to this factor of continuity in the feature story was strikingly shown in New York City a week ago. A steamer on the Sound was sunk in the night, drowning 140 persons. As the accident was one of unusual extent, horror and suffering, and since it occurred within a short distance of the city and involved the fate of many New Yorkers, it was one which would naturally have been chosen for featuring, yet the most popular of the yellow journals gave it a subordinate place and used its six-inch head lines for the announcement that the murder trial to which it had been giving special attention was postponed for three days. It would not permit the serial story, which it had spent so much money in working up, to be displaced by anything else, however important in itself. Probably the Sound steamer contained no life any more worthless to the community than that of the criminal on trial. Certainly a shipwreck is intrinsically more dramatic than the tedious detail of modern court proceedings. But the eyes of common humanity are turned toward the future. People take more interest in the potential execution of one man than in the actual death of 140. The difference that decided the relative news value of the two pieces of intelligence was just this: that the catastrophe was over by the time it was reported, while the trial was continuous. The catastrophe was past, and being past, tho merely by a few hours, it was in the same class with the Lisbon earthquake and the destruction of Pompeii. Less prominence was given to the wreck of this steamer than had been given for days to the unusual delay and possible loss of an ocean vessel a few weeks before. People are less interested in what they know than in what they do not know, and less in what is unknown than in what is at the time unknowable.

The serial feature story must have the same materials as other forms of melodrama and romance. It must have its villains and heroes, beautiful and abused damsels, picturesque contrasts of poverty and riches, themes of love and hate expressed in violent action, and, above all, its mystery. It is largely based on crime, but so also is the historical novel, the opera, the stage tragedy and the modern mystery or detective story, and for the same reason—because crime affords the most sensational dramatic material. The yellow journals in many cases do not

contain so many horrible or obscene details of crime as the newspapers that pride themselves on their conventionality and conservatism. Their stories are not more realistic, but are staged in a more spectacular manner. The fact that writers who have made a reputation in popular poetry and fiction are called upon to contribute chapters to the serial feature stories indicates that they are to be classed, not as sober narrative, but as a new branch of imaginative literature.

A Professorship of Skepticism

It was one of those late hours at the club. The rooms were nearly deserted, but a circle of men in no hurry to go home had drawn together in a comfortable corner for one or two more good stories or anything else worth while. Among them was the broad-shouldered figure of a distinguished man of letters, who has traveled in every clime, whose researches have led him thru the intricate history of strange beliefs and popular obsessions, and whose memories go back to the strenuous days of anti-slavery struggle in the United States. Some one got up to knock the ashes from a pipe. There was an instant of silence. The Homeric figure straightened. "What this country needs," he began—and every one took notice—"what this country needs is a professorship of skepticism."

A smile just perceptible, inoffensively cynical, revealed the gentle skepticism of the group. The same thought was in every mind, and some one presently put it into words. "Where will you find a university professorship today that is not a chair of skepticism? What scholar or scientific man is there who is not in the idol-breaking business?"

"Ah, you misunderstand me," resumed the oracle. "I don't mean scientific skepticism, or historical or theological skepticism. I mean the skepticism that we have need of today in our everyday life, the skepticism that should expose the absurd ideas, the silly stories, the preposterous reforms, the monstrous credulity that make up the mental furnishing and the social interest of the American people in this present generation—the alleged intelligence of a newspaper-reading population."

And by the time the grand old man had explained his full meaning, with much varied and forcible illustration, his listeners were abundantly satisfied that he had made good his case.

It is perhaps not easy to say just why the American people at this present time is so gullible in respect of all manner of things—scandalous, therapeutic, spiritualistic, promotive and political. Any discreditable story goes. Personal reputations count for nothing before the onslaught of the imaginative interviewer or the penny-a-line romancer. The solemn proclaimer of a new faith is quickly surrounded by a crowd of witnesses, palpitating with—"new light." Under new names and in fresh combinations the old nostrums work their magic cures. Fortified by pills and piety, the same old multitude invests its savings in mid-prairie corner lots, or dreams its visions of champagne and chauffeurs forthcoming from the salted Eldorados of geological survey maps.

The professor of skepticism should set himself the double task of learning, if he can, why these things are so, and of raising up a body of educated young men who may be expected to go forth into a credulous world armed with the weapons of rational interrogation.

However, since skepticism is our theme, we are moved to ask how the professorship of skepticism is to be endowed, or from what other source its incumbent shall draw his due meed of corn and wine. We would not press skepticism too far; we are merely setting an example, and it may be that the ravens which fed Elijah are still circling somewhere in the wilderness.

The Admission of Senator Smoot

Against the judgment and honest prejudice of many of our readers we have favored the admission of Mr. Smoot to the United States Senate. We have done this because, as we believe, he represents the new and not the old Mormonism. It is true that he is a Mormon, but the majority of the citizens of Utah are Mormons, and have the right to

choose their Senator. It is true that he is an Apostle in the Mormon Church, but that is in itself no more objection to his admission than the fact that other Senators have been elders, deacons and clergymen. The only question which it was right to introduce was, whether he was himself a polygamist or was the defender and representative of a social system condemned by the conscience and laws of the nation. But such he was not. He has never had more than one wife, and he has constantly and consistently opposed polygamy. It is true that he is a member of a board of Apostles, some of whom had married polygamously before Congress admitted Utah on the basis of monogamy, and before the Mormon Church forbade future polygamous marriages; but polygamy is a dying institution, and the new and controlling Mormonism opposes and forbids it; and if there have been any polygamous marriages since the laws and the revelation which forbade it, they have not had the sanction of the Church and are exceptional, like such cases that occur in the rest of the country. The only difference is this, that the old men who took plural wives many years ago have not usually selected one of their wives and discarded the rest. They do not choose to, and they do not think it right. These old men and women are dying off, and the institution is coming to an end gradually. The trend, the purpose, the sure conclusion is right, even tho casuistry may defend the continued relation in these exceptional cases. Mr. Smoot, in an unimpeachable speech, solemnly uttered his long and consistent opposition to polygamy in theory and practice, and declared with equal solemnity that he had never taken any ecclesiastical oath which interfered with his complete loyalty to the nation. The Senate believed him, and so do we.

This conclusion of the Senate condemns the campaign of the women who have tried to prevent his admission on the ground that he is a Mormon and an Apostle. We think that they were badly advised. They did not fully understand the historical importance of the act by which the Mormon Church renounced polygamy. That was a revolution which could not go backward. Nor did they understand the relation of Mr. Smoot to the United States laws. They meant well, but their campaign of letters and appeals to the Senate was improper as addressed to the Senate acting as a court to investigate facts and not to enact legislation.

What Is Left of the Old Gospel?

WE have received, from persons who are evidently very deeply concerned as to what faith will be left to them in case they are compelled to discard certain doctrines of the Church which are now widely questioned, a large number of inquiries similar to the following:

"The 'Undistinguished Heretic' is very frank, yet not quite frank enough. He tells us with considerable detail what he disbelieves and how he came to disbelieve it. He will endeavor, he says, not to preach what he does not believe. But what does he preach and what does he believe?"

The fear that modern scholarship will deprive Christianity of its gospel hovers over many minds, and in many quarters critical studies are anathematized or eschewed, according to the measure of zeal and passion, because of the belief that they will rob the Church of its message of redemption. To be thoro in criticism, which simply means to be conscientious and painstaking in the investigation of facts, and at the same time to be truly devout, a man full of prayer and good works, is a combination of qualities whose realization appears to many to be impossible.

The union of these virtues in one individual is by no means unattainable, and a progressive minister may make himself master of an evangel the world needs and longs to hear. Our "Heretic," for example, has said nothing inconsistent with a thorogoing acceptance of the doctrine of the prophet Amos. In the days of Amos princes and mighty men sold the righteous for silver and the needy for a pair of shoes; they turned justice into gall and the cry of the oppressed into wormwood, and with exactions built houses of hewn stone. Over against them stood the Tekoan herdman, alone with righteousness, but certain that the God of the

Pleiades was authority for the word of right that burned within him, and that his resentment of iniquity came straight from the might over all. On the basis of the moral truth that thrilled irresistibly in his heart, he blanched the faces of royal servitors and heartless plutocrats. In our time there are children by the thousand under twelve years of age in Southern cotton mills, and a leading American railway employing 16,000 men for its service within a single State injured severely over a thousand, one out of sixteen, in one year, and killed 33; and for risk and labor paid an average yearly wage of $656.45! Indisputable facts, accessible to every minister, are sufficient to impart stinging realization of injustice and iniquity, which, by a man of spiritual insight and of sense for the real inwardness of things, will be denounced with mention of the God of right and in language of genuine religious passion. A modern minister might find his texts in Amos for a number of years, and if he had something of the fervor and intensity of the old-time dresser of sycamores, his sermons would not lack for hearers nor would his conscience be troubled lest he might be failing to accomplish good.

But a clergyman of liberal tendencies is by no means confined to the Old Testament. The Gospel which was found so uplifting and satisfying in the towns about the Sea of Galilee may still be declared, in all its gentle sweetness and with every whit of its inspiring hope, by the most thoro advocate of critical methods of investigation. Criticism has not diminished the number of the beatitudes, nor raised one word of objection to their essential truth. The man who has the blessing on the poor in spirit and the pure in heart ready to his lips, and has yet nothing to preach, is sadly deficient in spiritual gifts. There is enough gospel in the Lord's Prayer to satisfy the deepest religious needs; and after all the philosophies have told their utmost, and history has been corrected to the farthest reach of our ability, that prayer abides, expressive of genuine human need and of an attitude of mind and life to which the highest knowledge can raise no valid objection. The parable of the prodigal son declares a view of the world, of human life and the power that controls it which is as possible today to a man of earnest aspiration as such a faith has been at any time.

The Christian gospel in the first instance was the result of sublime faith. In a land of poverty and hardship, surrounded by bigoted scribes and narrow fanatics, with few that sympathized with him and perhaps not one that understood him, a Jewish peasant declared that a God of love and mercy cares for the world in fatherly tenderness, and that the heart that trusts Him may abide in peace and be victorious over every enemy, outward and inward, let the world do what it will. If events could have destroyed that faith, it surely would have been dissipated under the experiences it was called upon to meet. But it was a treasure of the soul, and it held firm despite the cross. It was not a demonstration from events; it did not rest upon authority; it was a religious faith, and therein lay its strength.

It does not appear that criticism has shattered that faith in the least degree, and it is not easy to see how it can be shattered. That there is a good God whose power is over all the world, and who in ways beyond our knowing is working in all things for good, is a hope as accessible to brave souls today as in any age of the world, and he who possesses this confidence—as one is almost sure to possess it who studies deeply into the spirit of Jesus—and has not a gospel, must have small sense for the heart-hunger of the world and the blessedness of satisfying it.

There are some things in Paul which may not be preached as valid truth for today, *e. g.*, that it is better not to marry and that God does not care for oxen. But the essential message of Paul, that a man is saved by his personal faith, that religion is free from laws and traditions, and that there is real redemption in the Christian revelation, is truth perhaps better fitted to these times than to any generation previous. The most modern man, while he will not consent to bind himself by every expression of Paul's, will find text after text in the great Apostle which he can enunciate with unction as permanent and self-evident truths of the spiritual life.

Sufficient has been said to indicate that the progressive minister is not deprived, by the views to which he feels himself compelled, of earnest truths of deepest moral and religious import. His gospel will not have the precise accent of former times, but it may have the same ring, the same intensity, and it may do the same work; and whether it does or not will depend upon the moral earnestness and spiritual insight of him who preaches it.

A Vierbund of Peace

EUROPE now for a generation has been divided into two Bunds for war and peace. With the heaviest armaments of war the fear of each other has kept the peace in Europe ever since the great war between Prussia and France in 1870. On the one side was the dual alliance of France and Russia; on the other was the Dreibund of Germany, Austria and Italy. Of late years both these alliances have been weakened. The terrible defeat of Russia by the new Eastern Power of Japan, with the revolutionary movements that have followed, has made Russia an utterly uncertain reed on which to rest. On the other hand, the nearer relations of Italy to both England and France have in fact, if not in terms, detached Italy from the predominant partner in the Dreibund, while Austria has had her political dissensions, and it is far from clear that Hungary would care to take part in a war to help a German victory. Thus these mighty military alliances have pretty nearly dissolved.

Meanwhile new alliances have arisen, altho we do not fully know what are their secret provisions. Following the war between Russia and Japan came the surprising announcement of an offensive and defensive alliance between Japan and Great Britain. This seemed quite a new policy for Great Britain; for, in her insular position, she had for years boasted of her isolation and entire independence of action. Then came the confessed alliance between Great Britain and France, two Powers long suspicious of each other. But there is still an alliance, altho weakened by events, between France and Russia, and now we are told that negotiations are being concluded for a close alliance between Great Britain, Russia and Japan. If all these alliances are practically concluded—and such seems to be likely—it creates an impregnable Vierbund of Great Britain, France, Russia and Japan, with Italy, and indeed Spain and Portugal also, benevolently associated with them, and the United States in sympathy for all purposes of peace. On the other side stands Germany, the only Power whose uncertain designs have raised doubt and anxiety, with only half of Austria her possible ally in the event of war, and the other secondary northern Powers—Holland, Denmark, Sweden and Norway—absolutely driven to a peaceful policy, and Belgium also, if not forced to take part with France in the event of war.

We thus see a formidable and irresistible alliance which can compel peace. As it now appears, a European war is made impossible. The Vierbund, with other Powers sympathetic, controls the situation. War is forbidden.

Then why not admit and accept the conditions and privileges of assured peace? Indeed, do we not already see the beginning thereof? What does it mean that Great Britain has decided considerably to reduce her proposed armament? Why else does she cut down her anticipated expenditure for new ships of war? What does it mean that Great Britain will join with the United States in proposing to the Hague Conference this summer the reduction of that tremendous burden which the nations have so long carried, and which has loaded them with fearful debts? Even those nations which do not join in the agreement to propose the military reductions will consent to the propositions coming independently from Great Britain and the United States. The skies are clearing. The hopes of the people who have so long carried this burden, now insupportable, are brightening. The first Hague Conference gave us arbitration. This coming conference we now hope will limit armaments. We can hardly expect complete disarmament until we have, in addition to the international court which already exists, an international parliament and an international executive. That would be the Americanization of the world.

Play for the People

HERBERT SPENCER in his later years used to lament that he had not adopted a system of recreation, in conjunction with his brain work. He often said that what he had needed was play, simple play, "useless" from every other point of view excepting to recreate the wearing out system. This sort of human philosophy has been gaining great ground since ascetic literature poured vitriol on anything like a departure from work. Dr. Holbrook, who founded the Holbrook School, that has gained considerable eminence for preserving the health of the pupils, as well as toning up character, used regularly to enter into all the sports of his pupils. He wrestled with them when out of doors, and snowballed as an equal. It did not weaken his influence over those lads in the least. That which controls young people is character, and not grimness. Prof. John M. Tyler, of Amherst, is laying emphasis upon the fact that the large muscles must be kept in permanent use in order to save us from a nervous breakdown. He says that those who sit or stand in classrooms or offices, several hours each day, using brain and nerves, with the little muscles of the wrist and fingers, will inevitably go stale in a short time. One of our leading teachers defines going stale as having a colorless skin, an uncertain sleep, an undefinable dread of some things, a disinclination to laugh or to engage on new labors. He tells us that as a rule the teachers of the country get into a state of chronic staleness very early. They become cranky, fussy and busy, and cannot stand interruption. By and by he begins to repeat things over again, loses mental acuteness, is a poor listener, and finds it very difficult to take any rest.

That the children of our crowded cities must have play is getting to be obvious to everybody. They cannot be kept housed in tenement homes and tenement surroundings, nor can they be kept in schoolhouses five or six hours a day doing intellectual work, without a large supply of what Spencer called "useless play." There should be a large playground for every ward, in every city. A playground should be just as much a part of city life as parks and streets—especially parks where there is no possibility of play, and streets where there is little opportunity. Of course, these playgrounds should be under such supervision that they shall constitute a sort of outdoor schoolroom, yet they should be left without that sort of instruction which will make them nothing more than gymnasiums. There is some danger that there will be too much teaching in connection with games. We believe that college athletics has been greatly shorn of its simple healthfulness by systematic training for competitive struggles. This spirit has slipped down into the school playgrounds. Real play is letting the children loose to express their spontaneities. Professor Tyler says that the best results can come only by alternating play and class work. He thinks that manual training and gymnastics are better suited to some other place. Following his plan, play during a child's life becomes just as important as study. It is a recognized part of a school course, with its assigned hours.

But what we are aiming after, just now, is a bigger and broader fact—that is, that no one at any age can live healthily, and be a wholesome human being, without play. We believe that city life particularly demands provision for relaxation for those who are in mature life It is in this way only that the burdens of life can be kept from rapidly wearing one out. We believe further that the public can so provide for relaxation and recreation that the whole community shall feel the benefit of it from a sanitary standpoint, and in the very great reduction of crime. Public playing is a feature of the life of Norwegians and in some of the Swiss cantons. It works admirably in the way of keeping health and a good social atmosphere. Precisely as with the young, so with the old—play has a hygienic value. It prevents the overtaxing of the brain and heart, the organs most likely to be broken down by hard work and anxiety. Play seems to fill a peculiar place in the way of equalizing the circulation of the blood, and the strain placed upon the different organs. Play also furnishes a kind of mental training which is very necessary in adult life. It takes the attention from a single affair, and it keeps all the sense

organs alert. Nor can we easily make too much of the social element in this matter. We get easily differentiated from each other in the struggle for bread and a living. Each one has his own office, where no one else is completely at home. At present we are hardly thrown together, except at church, or in some conventional party. In fact, there is no such thing as a commonwealth of intercourse remaining. A good playground seems to be exactly what we all need.

But have we really any time for games? Who can leave his business to spend an hour at sport every day of his life? We have seen this tested, in a small way, very successfully, by a communal bowling alley. Business men of all sorts and bankers did find it possible to get away from work and enjoy themselves in a very simple, free and easy way. They threw off their burdens, laughed and shouted and recreated. Golf has proved a useful game for many, and croquet and tennis have done a great deal of direct good. They do not quite fill the bill, however, as family games. What we want is a public recognition of the value of play, and opportunities for gathering together precisely as we would group our children.

The gospel of play will, we are confident, win for itself a hearing as the gospel of wholesomeness and a fuller life. It will go far to create a better race of manly beings, a better social state, and throw a new light on the piety of grimness and "otherworldliness." What we have said has been applied mainly to city life, to the overpacked and unnatural crowd; but it is applicable, in a modified form, to country life. The people who live among the trees and brooks do get, in spite of themselves, a certain relaxation, yet they need what they do not get —the useless sport, the utter relief for a portion of each day from "trying to make ends meet." Play is instinctive, and it is instinctive in old age just as truly as in earlier life. Knuckling down to the hard grind of routine toil is unnatural, and whoever does it, whether millionaire or pauper, gains nothing by it. It is a habit of living unnecessary outside of the sweating shops. We are so convinced of this that we should like to see our municipalities and our townships take up the problem, and provide places where the whole people can gather together, give up the eagerness of business and lose themselves in simple sport.

A Free Church and an Endowed Opera

It was Count Cavour, the famous Italian statesman, who coined the phrase "a free Church in a free State." This is the policy which France has adopted. Now that the Government has cut off all subsidies from the Church and provided for their gradual extinction, there are a few discontented artists who demand that the Government shall withdraw them from the opera and theater, and they are raising the cry of "a free Opera in a free State."

But this turn of the phrase is not likely to be popular. Sects in art are often quite as exclusive and quite as polemic as those in religion; but the probability is that if they could combine sufficiently to have political importance they would ask a greater allowance from the Government instead of a diminished one. The outcry is not against the opera or drama in France, but against the method of its application. When a new author is turned down at the Comédie Française or at the Opera he is less likely to demand the abolition of the union between art and the State than to ask for the appointment of a more liberal Director. There is always an opportunity also for an author like Rostand or a player like Sarah Bernhardt to make a reputation outside of the Government theaters.

The discontent mentioned is local and exceptional. The way France has conducted its theaters, operas and the schools of music and drama which minister to them has been such as to give an impulse to art; talent has been developed and genius has not been fettered. The Grand Cross of the Legion of Honor has just been conferred upon Sardou. Pierné, whose "Children's Crusade" has made an impression on both continents, is a graduate of the Paris Conservatory, as is also Saint-Saëns. To these among the living might be added a long list of actors and singers who have graduated from the Government schools and made their

reputation in the Government theaters. A simple glance also at the list of plays and operas given at the Government theaters and opera houses at Paris is an indication of the high artistic character of the plays presented. And one may speak with equal positiveness of the way in which they are rendered.

In addition to the price and the stamp tax on every theater or opera ticket the Government makes liberal provisions in its budget for the deficit between receipts and expenses. Thus the grant provided for the national theater in the French budget for the coming year amounts to nearly $300,000. There is, besides, a liberal provision for open-air concerts and appropriations for the national conservatories of music and declamation and for their auxiliaries in the different departments. In addition to this there are the grants given by municipal authority. Marseilles appropriates $49,000, Nice $39,000, seven cities make an annual appropriation of more than $20,000, six cities give over $10,000, nineteen cities over $4,000, and thirteen cities over $2,000 a year. The amount thus expended amounts to nearly half a million dollars annually. Now the Parliament is considering a plan of providing a large number of popular theaters in Paris, well distributed and at prices which will reach the multitude. Thus, while religion in France will hereafter be obliged to stand on its own feet as it does in this country, art is becoming more and more the subject of Government support.

American Sympathy for Russia

We print on another page in this issue portraits and short sketches of Alexis Aladyin and Nicholas Tchaykovsky, the two Russian patriots and revolutionists, who have just come to this country to organize sentiment in behalf of the oppressed subjects of the Czar and the bureaucracy. Ever since the unfortunate Gorky affair the American public has taken too little interest in the Russian revolution—the greatest political drama now being enacted in the whole world. But at last we believe that public sentiment is changing. A national relief committee has already been organized thru the efforts of Mr. Nicolas Shishkoff, a Russian noble and member of the Council of the Empire, who has just come to this country to raise money for the 20,000,000 or more starving peasants in the Southeastern provinces. It is said that a gift of only $5 will save a peasant's life until the crops are gathered at the end of summer. Those, however, who look beyond mere relief will contribute their money and influence to the committee formed to help Aladyin and Tchaykovsky, who are engaged in the more radical work of changing fundamental conditions. They and their comrades are fighting for the same life, liberty and the pursuit of happiness as our forefathers did in the American Revolution. We hope that the American people will generously support both committees. But above all we urge American bankers not to loan money to the present Russian Government. It is principally foreign loans that enable the present bureaucracy to keep in power. Happily the Jewish bankers of the world are already refusing any further financial assistance. Let all other bankers follow their example.

Professor Sterrett's Expedition

We always rejoice in an American expedition for exploration or excavation in Egypt or the nearer East. Such is that now planned by Dr. J. R. S. Sterrett, Professor of Greek in Cornell University, who will take with him four young scholars who have all had experience as students in the American School of Archeology at Jerusalem, and so have a certain command of Arabic, while Professor Sterrett's previous expeditions in Asia Minor, and his service for years as secretary of the American school at Athens, have made him familiar with Turkish and modern Greek. The expedition hopes to leave Constantinople about May 1, and will cover a large part of Asia Minor, pass on to Urumia in Persia, and then go down the Tigris to Baghdad, and then to Susa, Persepolis and other famous Persian ruins, and then return and visit Babylon, Kerbela and Nedjef, and pass up the Euphrates to Carchemish; and thence thru Palmyra, Hamath, Antioch and Tarsus to the coast.

The primary object is education, that the men may be made familiar with the land by eighteen months in the saddle. Of course, they will take photographs, copy inscriptions, locate ancient cities, and reconstruct the map as far as possible. The expedition ought to cost nearly $15,000, of which over half has been subscribed by generous friends of science and knowledge.

Abraham and the Aryans

Sir William Ramsay is no wild scholar. He is the most competent living authority on explorations in Asia Minor, where he has been season after season following the Roman roads and the travels of St. Paul, and gathering old inscriptions, finding Hittite monuments and locating ancient cities. Now he says, in an address, that he believes great discoveries are in store, following the work of German explorers and the grant of funds by Lord Strathcona for five years of excavation of Hittite sites. We have mentioned Dr. Zimmern's great find of Hittite tablets, in cuneiform writing, at Boghazkeni, the Hittite capital, among which was a partial duplicate of the treaty with Egypt, which Rameses was so proud to record on the walls of Egyptian temples. Now Professor Ramsay says he believes the Hittites were Aryans, as Jensen first argued, and as Sayce now believes, and that these Hittites were the founders of Aryan culture; so that we Aryans must all go back to those Hittites for the source of the Greek civilization and our own. If so, it is of great importance to unravel the mystery which has so long shrouded them. The text of Professor Ramsay's address is not yet at hand, but it is not easy to believe that we must revise our conclusion that the original seat of the Aryans was in the highlands of Central Asia, from which they carried the Sanskrit language to India and the Iranian to Persia. But it is quite possible that along the line of the Hittite settlements in Asia Minor they moved over into Russia and Greece and all Europe. Professor Ramsay says, somewhat airily, that he will not be satisfied till we discover the record of the sale by the Hittite owner of the cave of Machpelah purchased by Abraham, for it must have been recorded on a clay tablet and be still somewhere preserved in a Hittite temple. That would be a great discovery, only to be matched by finding the fragments of the two tables of the law which Moses smashed on Mount Sinai. In this connection we must record another discovery by the lucky Theodore M. Davis in Egypt, that of the tomb and mummy of the most famous of Egyptian queens, Teie, the mother of the heretic King Amenophis, who tried to convert his people to monotheism.

The French Muddle

It is not wholly easy to see why the hopeful negotiations between the French Government and the French hierarchy have been interrupted. The main reason given by the bishops, in obedience to the Pope, is that M. Briand requires that the priest who takes a lease of a church for worship shall agree to keep the building and its furniture in good condition. The form of lease drawn up by M. Briand, and modeled on that proposed by the bishops, thus reads on this point:

> "The Abbé Z——, because of the free use accorded to him, will maintain in good condition the building and all its belongings, and will be responsible for all expenses and charges indicated by Art. 13 of the law of December 9th, 1905."

This agreement to keep the building and its furnishings in order was not included in the form of lease as proposed by the bishops, but it seems quite reasonable, considering that no rent is charged. The bishops—that is, the Pope—object that it recognizes the law of 1905. Exactly why such objection is made is not clear, inasmuch as the bishops' own draft of lease approved by the Pope also recognized the law. The bishops, we are told by cable, also object to a provision that no foreign priests or members of the dissolved religious orders should take leases of the churches. No such provision is in the form of lease and circular to the Mayors drawn up by M. Briand; but wherever it is to be found it does somewhat limit the freedom of worship, and yet does not seem politically without reason. The hierarchy appears to be over-sensitive and to stand unnecessarily on their dignity; but we must remember that they have no mind of their own, but obey orders from beyond the Alps.

The Remaining Concordats

With the end of the French Concordat there remain but seven countries that have concordats with Rome, namely, Austria, Bavaria, Belgium, Monaco, Portugal and Spain, and Ecuador in South America. It is a long stride since Luther, facing Charles V. and Rome at Worms, said: "*Ich kann nicht anders.*" But all Europe, except France, maintains union of Church and State, even Protestant England and Prussia, and our States do practically the same thing when they give appropriations to private charities of various denominations. There should be constitutional amendments forbidding these subventions. Even the Pope, who refuses to receive the $600,000 a year allowed him by the Law of Guarantees, receives indirectly thousands of dollars from the Italian Government in the form of free transmission of his telegrams and despatches. During the Christmas holidays he received countless telegrams from all over the world, and the number increased by the French troubles, and all these were answered, not always in few words, and all franked. The number was so great that the public service was all upset.

A Religious Struggle in Brooklyn

Expulsion of religious orders, disestablishment, seizure of Papal documents at the Paris nunciature and a few more pleasantries between France and Rome, have made history *calamo currente*. But the chronicles of the Catholic Church in America will record ecclesiastical turmoils; happily, however, only internal. Such a one is that of the Franciscan Brothers of the Third Order, who are at sixes and sevens with their bishop, Dr. McDonnell, of Brooklyn. Long Island is singularly free of religious orders of men, for it has only two—the Lazarists and the Franciscan Brothers. The first Bishop of Brooklyn, Dr. Loughlin, kept out all the religious orders of men save these two. Now these Franciscans have waxen fat and kick against the episcopal yoke, which fain would retain them as a purely diocesan body, to whose members the priesthood is denied. The Brothers have asked Rome to raise them to the full Franciscan Order, but which order the cable despatches specify not. Some fourteen years ago Leo XIII wished to bring hegemony into the many branches of the Order of St. Francis. He summoned the seven generals of the seven divisions to conferences and labored hard to reduce the seven to one. Leo was a great Pontiff, an enlightened statesman, who could create the hierarchy of Scotland and that of far-off Japan; who could establish the Apostolic Delegation in Washington; who could keep in check the unruly elements in France and America; who could charge the whole astounded American Church with heresy in his encyclical on Americanism; who could settle satisfactorily the dispute of Germany and Spain over the Caroline Islands. But Leo could not compound the seven Franciscan generals into one. He got rid of three. There are still four Franciscan generals, ruling an equal number of branches—Capucines, Recollets, etc. We may be sure that all four, however, are as one against the Bishop of Brooklyn. How so skilful a diplomat and so cautious a man as Bishop McDonnell was unable to rise to the occasion and second the aspirations of the Franciscan Brothers is hard to understand; courage got the better of policy. We fear it will spoil his chance to change a purple for a scarlet biretta, and that he will be allowed to pass from Brooklyn only to Calvary Cemetery.

The growth of industrial education has reached such proportions that a far better equipment of our experiment stations and agricultural colleges is imperative. Apart from those of two or three of the Northwestern States, every one of these stations and colleges is checked in development and sorely limited in the good work that should be accomplished. The people should be alive to this point, and should wake up promptly. Delay just now is liable to do irretrievable damage to the hesitating State. The New York Association for the Promotion of Agricultural Education and Research calls loudly for an auditorium for public meetings, conventions, etc.; but still more it wants houses for the station staff, and an electric plant for lighting and motor pur-

poses. We notice very similar calls from half a dozen other States, all indicating that these stations are not receiving the attention which their good work deserves. It is an industrial age, and THE INDEPENDENT has done its best to adjust itself to the spirit of the times, and call its readers to the same apprehension of events and tendencies. Our whole educational system must be kept fully equipped for the new duties laid upon them and the new demands made of them.

The Diocese of Southern Ohio of the Episcopal Church has a case of heresy more serious than that of Dr. Crapsey, but it has been treated differently. The Rev. George C. Cox did not, like Dr. Crapsey, put a spiritual meaning on the Apostles' Creed while still claiming to believe it, but he frankly denied his belief in its statements. Thereupon his case was presented to the Standing Committee of the diocese, which decided, for prudential reasons, not to bring him to trial. This action does not have the approval of Bishop Vincent, but is final for the present. Such cases as those of Dr. Crapsey and Mr. Cox will settle whether the Episcopal Church is to be, what Phillips Brooks liked to call it, the broadest Church in Christendom, or is to be a refuge for those escaping heresy in other bodies.

It is now more than forty years since the conclusion of the Civil War. Those who took part in it have past away, or are old men physically too feeble to support themselves by manual labor. Congress has enacted the service pension bill, which gives a moderate pension to all men over sixty-two years of age, and there are very few under that age, and not many left above it. The law is a proper one, and will be no great drain on the Treasury, as nearly all have pensions already who would be willing to take one.

There is offered for sale at auction in London a bridal gift of Claude, Queen of France and consort of Francis I, who was King when Luther revolted, and whose wars with Charles V of Spain helped on not a little the growth of the Reformation. How did this beautiful specimen of French art—an exquisitely illuminated manuscript missal, written upon vellum, with page after page of miniatures—reach England? "Its presence there"—runs the cable dispatch—"is due to the current ecclesiastical troubles in France." That would imply that it was smuggled out of the country. It was to prevent just such loss of art treasures that France insisted on prompt inventories of church properties and possessions.

It is not all the Georgia counties that employ State convicts' labor, and the State Treasurer has distributed to them $53,000 profit for the hire of convicts for a single quarter. We restrain ourselves from speaking now of the character of this convict system, and observe that the counties—mostly northern counties, we presume, have the authority to use this money either for public schools or work on the public roads. Only 19 per cent. is given to the schools and the rest to roads.

It may as well be understood that the movement for simplified spelling is one of the livest movements a-going. Similar organizations will follow in England and Australia. There are 15,000 people in America who have pledged themselves to use the shorter spellings, and doubtless a multitude of others would if they only knew that by writing to the Simplified Spelling Board in this city they could get free the documents which explain the movement.

Why should not the United States build the Canal? We see no reason. The only reason suggested is, that a contractor could employ coolies, or treat workmen like slaves, and the Government not seem to be responsible. We believe that with one responsible engineer the Government could do the work better and cheaper. Under the proposed contract the greater the expense the more the profit to the contractors.

More prohibition, and yet more, is the purpose of the law just past in Tennessee forbidding the sale of intoxicating liquors in the whole State. Thus far local option has been growing and is effective. How prohibition will work in Memphis we want to see.

Insurance

Steam Boilers and Their Hazards

THE invention of the steam engine was a tremendous contribution to civilization. It revolutionized business and the methods used in transacting it, in a thousand ways. In manufacturing and in transportation its influence was particularly powerful. Distances were shortened and the flight of time itself was held back in the sense that steam power made possible a larger output in a given period than could have been before steam had been harnessed to the engine. The beneficence of steam was very great; but, on the other hand, a new hazard sprung up because of the introduction of steam into handcraft. Steam, like fire, is a good servant, but a hard master. The steam boiler, it was presently found, had a lot of new hazards which menaced life and property. The boiler would explode under certain conditions. Chemical solutions in the water used tended toward bad effects on perfectly good boilers. The deposition of scale or sediment became a hazard in connection with steam boilers. Sometimes boilers had serious defects in them, inseparable from the process of construction, and sometimes boilers collapsed or became ruptured. In the early days of steam engines it was doubtless considered that the hazards arising from all these various causes were necessary evils that went hand in hand with the subjugation and utilization of steam by humanity. Step by step it was found, however, that some of these hazards were not due to the so-called "hand of God," but were preventable, and an application of the insurance principle to steam boiler hazards was finally made. The Hartford Steam Boiler Inspection and Insurance Company was perhaps the first company to organize in this country for the sole purpose of safeguarding and making practicable the general use of steam for power purposes, and for the scientific construction, installation and maintenance of steam power plants. To accomplish all this it was found needful to organize a very complex system, which included the maintenance of a department of construction and drafting, the establishment of a department of chemistry, a rigid system of supervision and inspection, which calls for the existence of a corps of skilled mechanics permanently employed and located at strategic points thruout the United States. In connection with this particular brand of insurance, a high class technical journal, known as *The Locomotive*, is published, in which there is a broad survey of the general subject of mechanics and which has become a recognized authority on all questions relating to steam and the construction, installation and maintenance of steam power plants. By means of the scientific inspection of boilers, averaging 797 per day during the year, examinations for defects, leading frequently to the condemnation of dangerous boilers, and by means of pecuniary protection afforded against any loss or damage occasioned by explosions, collapses or ruptures of the boilers covered by its policies, this company has succeeded in minimizing the hazards incident to the operation of steam machinery. Owners of plants in which steam appliances are installed have for the most part recognized the protection afforded by steam boiler insurance, and those who have not yet done so may well think it over before they reject the insurance idea and its application in this field.

Governor Hughes and Otto Kelsey

THE Superintendent of Insurance in this State, Otto Kelsey, having refused to resign at the request of Governor Hughes, a public examination of Mr. Kelsey, almost if not quite unprecedented, regarding his fitness to hold his exceedingly important and highly responsible position, was made last week. Before the examination the Superintendent of Insurance, accustomed to machine politics, was exceedingly defiant. He had a considerable political following and the discomfiture of the Governor in his attempt to displace Kelsey was confidently expected. The examination conducted by Governor Hughes with all of the skill that characterized him during the Armstrong investigation, left the State's Superintendent in a very pitiful position and while his displacement as Superintendent of Insurance may be postponed it cannot now be absolutely avoided. The action of the Governor marked as it was with courage and boldness is a very hopeful sign looking toward the regeneration of politics.

Financial

A Great Mining Company

RECENT events have directed attention to the great Calumet and Hecla copper mining company, which is in no sense a speculative property. On the 15th inst. five shares were sold in the Boston market at $1,000 a share, the highest price ever reached for stock of a copper corporation. A quarterly dividend of $20, a few days later, brought the total of dividend payments up to the great sum of $101,350,000. The capital is only $2,500,000 (in $25 shares), and of this only $1,200,000 was ever paid in. Alexander Agassiz is the president, a man of scientific attainments, now advanced in years, who, as superintendent, developed the mine nearly forty years ago. The company has steadfastly maintained its independence, refusing to become a part of any combination. It is now purchasing control of other copper companies whose properties lie near its own, in Michigan, and within the last two or three weeks has obtained possession of majority interests in the Osceola, Tecumseh, Centennial and Allouez companies.

The Walker Case

IT has been ascertained that William F. Walker, the missing treasurer of a savings bank in New Britain, Conn., of whom we spoke last week, had been engaged in speculation of a disreputable character, and had also been swindled out of $350,000 of the bank's money by sharpers. It is said that he resorted to speculation only at a very recent date. Some of his former friends are still unable to account for his course except upon the theory that his mind became affected. For many years he had lived methodically and economically and had enjoyed the confidence of all. He was deacon and clerk of a Baptist Church, superintendent of its Sunday school, and treasurer of an association of Baptist societies, and he had been a director of the Y. M. C. A. He had seemed to regard all speculation or gambling with the greatest aversion, and had even refused a bank loan to an applicant upon the ground that the latter had been known to play a game of poker. According to the latest reports, it was in November last that he began to lose money in bucket-shops during his visits to New York, where he was accustomed to be treated by physicians for a serious ailment. Sharpers engaged in the "wire-tapping game" suspected that he had lost the bank's money and thought he might listen to their offer of an opportunity to regain it by joining them in defrauding a racing poolroom. He eagerly consented, and was deceived by their bogus poolroom and their machinery for tapping wires and stealing dispatches. In his first venture he lost $110,000, and in his second and last, $240,000. Then he disappeared, after sending to the officers of his bank a wild letter in which he asserted that the bank had been swindled by means of worthless bonds, and suggested that the loss be covered up temporarily by falsifying the accounts. The wire-tappers into whose trap he fell have fled to Europe.

....Orders for steel cars amounting to $150,000,000 are now in the hands of the car-building companies, whose capacity is said to be engaged for a year to come.

....Charles W. Morse and his associates have enlarged their combination of coastwise shipping by the purchase of the New York and Porto Rico Line, which has five steamships plying between Porto Rico and New York, and two in service between Porto Rico and New Orleans. It is understood that they paid $7,000,000 for the Mallory Line, and $6,500,000 for the Ward Line.

....The Astor National Bank and the recently organized New Netherlands Trust Company have been consolidated, and the enlarged institution will be known as the Astor Trust Company. It will occupy banking offices at 389 Fifth avenue. The entire capital stock ($1,250,000) has been taken by the respective Astor National, New Netherlands and Bankers' Trust Company interests. E. C. Converse is president and Alexander H. Stevens is first vice-president of the new institution.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Panama Canal Bids Rejected

In a letter addressed to Chairman Shonts, on the 26th ult., President Roosevelt announced the rejection of all the bids for work on the Panama Canal, the resignation (accepted) of Chief Engineer John F. Stevens, and the assignment to his place of Major George W. Goethals, of the Engineer Corps of the army, who will be assisted by Major David D. Gaillard and Major William L. Sibert, of the same corps. It also became known that Major Goethals would be made chairman of the Commission and that the President intended to appoint, as a member of the Commission, Senator J. C. S. Blackburn, of Kentucky, whose Senatorial term was to end on the 4th inst. In his letter the President said, after referring to the terms of the bids:

"The purpose of the contract was to secure, in the building of the canal, the services of the best, the most experienced and most skilled contractors in the country, at the least risk to to them, and at the least expense to the Government. An investigation into the two bids above mentioned shows that this purpose of the Government has failed. In each bid the contractors of experience, whose personal services in the work are what the Commission has sought, have made arrangements to divide the profits under the percentage bid with bankers or others to whom the contractors have had to look for the needed capital; so that the contractors who are actually to do the work, have arranged to accept a comparatively small proportion of the profits accruing under their contract. In other words, the Government by this arrangement is made to pay a high percentage for the use of capital which it might itself have furnished at a much lower rate, while the percentage which the contractors are to receive for the real benefit they are to confer on the Government is reduced to very meager and perhaps inadequate compensation. No contract can ultimately operate to the benefit of the Government in which the contractor's energy, skill, experience and personal supervision of the work are not adequately paid for.

"The defect in the bids which I have described and which our investigation has made apparent may be due to a defect in the invitation for bids, which perhaps stipulated for too heavy a bond and the investment of too large capital by the contractors, or it may be because the bidders have taken an entirely different view of the money risk involved from that taken by the Government. Mr. Stevens, the chief engineer, who proposed the form of contract, which with modifications was adopted, advises against accepting either bid because acceptance of either would not in his judgment accomplish the purpose he sought. The considerations stated are by themselves sufficient to require a rejection of all bids and a change in the proposed form of contract."

It was expected, he continued, that Mr. Stevens would supervise the work, but "less than ten days ago" Mr. Stevens had asked to be relieved as soon as he could be replaced by a competent person, and his resignation had been accepted. The withdrawal of Mr. Stevens took away the special reason for proceeding under the present form of contract. Major Goethals concurred with Mr. Stevens in advising that all the bids be rejected. As to the assignment of Major Goethals, the President said:

"It is not my purpose by requesting this appointment to disturb in any way the present organization on the Isthmus, which is very satisfactory, nor to interfere with the admirable work now being done by the present assistant chief engineer, Mr. Ripley, and the various heads of departments. The work of construction is going on well and will continue to do so. The organization already created is increasing the excavation each month, and can be relied upon under competent leadership to make further and constant progress pending a period within which a new form of contract can be devised by Major Goethals and his as-

sociates if it is deemed advisable to do the work by contract. The services of the same high class contractors whose bids we are now rejecting, or others of similar standing, may then be invoked in the interest of economy and speed."

Major Goethals is a member of the General Staff. He is a native of New York and was graduated at West Point in 1880. His most important engineering work was the construction of canals and locks to facilitate the navigation of the Tennessee River. His associates (one appointed to West Point from South Carolina and the other from Alabama) have had experience in making canals

MAJOR GEORGE W. GOETHALS.

and locks. All three are under fifty years of age. Mr. Oliver resents the rejection of his bid, and holds that he had assurances that it would be accepted. "If the President and Secretary Taft," he says, "could be made to understand the true conditions without the aid of a lot of cuckoos, it would be better for all concerned." The president of his company, Mr. McDonald, suggests that the rejection was due to the opposition of the transcontinental railroads. Supporting a resolution calling for the correspondence, Mr. Tillman said on Saturday in the Senate that he suspected there had been an attempt to compel Oliver "to let in some of his competitors who were too greedy on the first bid." The resignation of Mr. Stevens is explained in various ways. It is said that he found the climate disagreeable and thought his salary inadequate; that he disliked Oliver, who, he thought, would claim all the credit for making the canal; that he resented the criticism of Senators, and lost heart for his task; and even that he was opposed to the President's railway policy. It is reported that he will go to Europe for rest. Three civil engineers will accompany Secretary Taft in his visit to the Isthmus, where he will study the problems involved in the construction of a canal with locks.

The Santo Domingo Treaty Ratified

At an executive session on the night of the 25th ult. the Senate, by a vote of 43 to 19, ratified the new treaty with Santo Domingo. We recently showed what the provisions of this treaty are. Two Democrats (Mr. Clarke, of Arkansas, and Mr. Patterson, of Colorado) voted with the Republicans, and another (Mr. McEnery, of Louisiana) was paired in the affirmative. The number necessary for ratification was exceeded by only one vote. Mr. Bacon, of Georgia, was the leading opponent of the treaty. He argued that ratification would lead to the acquisition of both Santo Domingo and Hayti, and of "1,000,000 more negroes." The amendments adopted permit the President to appoint the receiver of customs without seeking confirmation by the Senate, and provide that the agreement which must precede any increase of the debt shall be with the United States instead of with the President. Owing to a prevention of fraud and of smuggling on the Haytian frontier, the customs revenue has increased, under American management, from $1,952,206 in 1904 to $2,223,324 in 1905, and $3,191,916 in 1906. Some think that it will be possible to retire in ten years the proposed refunding issue of $20,000,000 in bonds. ——The war between Nicaragua and Honduras had not been checked, at last accounts, altho a second note has been

sent by the United States and Mexico. Nicaragua has been quite successful, having captured one fortified town in Honduras on the 25th ult. and three more on the 1st inst. It is asserted that Salvador is assisting Honduras. Nicaragua complains that arms have been sent to Honduras from San Francisco. Shipments of arms for Nicaragua and others for Honduras were detained at New Orleans for some days by our Government, but were released on Saturday last.

The Harriman Railways

The Interstate Commerce Commission's investigation of the Union Pacific Railway system was completed last week, when testimony was taken for four days in New York. President Harriman was questioned for two days, and among the other witnesses was Otto H. Kahn, of the banking house of Kuhn, Loeb & Co., and until a few months ago a member of the Union Pacific board. It is impossible to make an adequate summary of the testimony within the limits of our space. We refer briefly to leading points. Mr. Harriman refused to say what price he had paid for stocks afterward sold by him to his company, or to give the date of purchase. He declined to say whether he had had a personal interest in certain large blocks of stock sold to the company by the banking house above mentioned, two members of which were in the board. He would not answer the question whether he had bought Union Pacific stock after July 19th, of last year, when it was virtually decided that the dividend should be increased from 6 to 10 per cent., and before August 17th, when the decision was made public. This question was suggested by reports current at the time concerning a speculation "pool" that was said to have yielded large profits to him and his associates. Refusal to answer was made upon the ground that the Commission had no right to inquire about his private affairs. The record of the handling of the Chicago & Alton road has excited much comment. A syndicate composed of Mr. Harriman, Mortimer L. Schiff, James Stillman and George J. Gould bought nearly all the stock of the company. Within six years, under their management, the capital stock was increased from $40,000,000 to $122,800,000, altho only $22,000,000 was spent for improvements. Large quantities of bonds issued by the syndicate were virtually sold to the syndicate at 65 and then marketed at from 90 to 96, a considerable part being taken by the great life insurance companies. The controlling owners also declared and paid to themselves a dividend of 30 per cent. The profit of these transactions appear to have exceeded $24,000,000. In due time 103,000 shares of the Alton stock were sold to the Union Pacific. The testimony showed that heavy commissions, amounting to several millions, had been paid to the affiliated banking house for its services in handling securities. Application may be made to the courts for an order compelling Mr. Harriman to give the information which he witheld from the Commission. Unofficial, but apparently trustworthy, reports are to the effect that in the judgment of the Commission a violation of the Sherman act is shown by the evidence as to the elimination of competition by control of the Union Pacific, Southern Pacific, Atchison and Clark lines; also by testimony as to the condition of the Illinois Central, Alton and Rock Island lines. Rates have been affected by the combination. The agreement relating to Senator Clark's road is held to be unlawful. It is expected that one result of the inquiry will be a suit by the Government for a dissolution of the combination, and that new legislation will be sought on account of the financial operations which have been brought to light.

Adjournment of Congress

The final session of the Fifty-ninth Congress closed at noon on the 4th. Both houses were in session on Sunday until late at night. In the Senate, the avowed purpose of Mr. Carmack to talk the Subsidy bill to death prevented action there upon that measure, which had been passed in the House by a narrow margin after an elimination,

by decisive majorities, of the provisions for payments to Pacific steamship lines controlled by Harriman or Hill railway interests. Among the measures upon which favorable action was taken not long before adjournment were the Currency and Philippine Agricultural Bank bills. The finished work of the session included the Immigration act (with the amendment relating to the exclusion of Japanese), the Service Pension act, an appropriation for two large battleships, an increase of members' salaries by 50 per cent., the Senate's decision that Senator Smoot was entitled to his seat, and the ratification of the treaty with Santo Domingo. Among the bills that died at the end of the session were those relating to copyright, child labor and the Philippine tariff.——Much surprise was caused on the 4th by the resignation of Senator Spooner of Wisconsin, which is to take effect on May 1st. On the 4th he completed sixteen years of service in the Senate. It appears, from the letter announcing to Governor Davidson his resignation, that his duty to his family requires him to resume the practice of his profession. In a public statement expressing his deep regret, Mr. Roosevelt says that year by year he has feared that the Senator would resign, because he knew "that every year of his stay in public life" had been to him "a direct financial loss which he could but ill afford."——Without waiting for the report of the committee appointed to investigate charges against Senator Bailey, the Texas Senate voted, 15 to 11, to exonerate him. After a majority of the committee had reported in his favor, the House gave him its support by a vote of 70 to 41.——The Pennsylvania House has voted unanimously to repeal the extraordinary libel law drafted in 1903 by Governor Pennypacker and enacted at his request. The press has ignored the law, and no one has attempted to enforce it.——There is no longer any doubt about the resignation of Governor Swettenham, who will soon leave Jamaica. He resigned on January 23d. It is said that the door was left open for him to reconsider and remain at his post, and that he has now decided finally to give up the office.

Relations with Japan

California's House of Representatives has passed a bill designed to prevent Japanese or Chinese from holding real estate in the State. It provides that no alien who does not become a citizen of the United States shall hold title to land for more than five years, and that the authorities shall compel a sale of land held by an alien if the holder at the end of five years has not become a citizen; also, that no lease of real estate to an alien shall be made for more than one year. In the California Senate a bill has been introduced providing that the Governor shall issue a proclamation thirty days before the presidential election of 1908, requesting voters to say on the regular ballot whether they favor or oppose Asiatic immigration. It is said that this bill will be passed. The attitude of the California Legislature may prevent the negotiation of a new treaty with Japan. At recent meetings of the Japanese and Korean Exclusion League it has been suggested that Mayor Schmitz, upon his return, should be greeted with rotten eggs.——In Philadelphia a Japanese named Sintaro Ota, who took out his first naturalization papers there in 1905, recently applied for final papers. They were withheld, and Attorney-General Bonaparte has asked for a revocation of the first papers, on the ground that the laws do not permit naturalization of Japanese.——For the construction of railroads in Manchuria, the Japanese Government has bought 50,000 tons of rails at Pittsburg. It is understood that orders for the cars, locomotives and bridges will be given to Americans.

The Philippine Islands

The bill for an Agricultural Bank in the Philippines was passed in the Senate last week by a vote of 43 to 14. When the pending Philippine Tariff bill was offered as an amendment, it was laid on the table (upon Mr. Lodge's motion) by a vote of 47 to 11. Another amendment, proposed by Mr. Culberson and rejected, 18 to 39, disclaimed any intention on the part of the United States to retain possession of the islands permanently, and asserted that the United States would withdraw after the creation of a stable,

independent government. It is intended that the new bank shall loan money to agriculturists. An income of 4 per cent. will be guaranteed for it by the insular Government. —— Official reports from the islands show that considerable progress has been made in grading for the new railways in Cebu, Panay and Negros. In Cebu, 4,000 men are employed; in Panay, 1,500.——Recent sensational rumors in this country about an approaching war with Japan have been discussed with some signs of agitation by the Manila press. One paper professed to have been informed that the islands were to be invaded in March, and that Japan would give them independence. Another was confident that Japan would not wait for the completion of the fortifications on Corregidor Island, at the entrance to the bay. Public meetings were held in Luzon, and some of the speakers, it is said, expressed a purpose to turn against the United States if there should be war.

Municipal Ownership Defeated in London

After the most exciting campaign in the history of London over the question of the extension of municipal activity, the advocates of this policy were overwhelmingly defeated. For the eighteen years during which the London County Council has had jurisdiction over such departments as the schools, drainage, fire department, tramways, etc., it has been controlled by men who believed in increasing the power and scope of the municipality. The last Council was composed of 83 Progressives, as those are called who advocate municipal ownership, 34 Moderates, or as they are now called, Municipal Reformers, who take the conservative side, and one Independent. The election completely reverses the relative rank of the parties. The new County Council will be composed of 79 Municipal Reformers, 36 Progressives and 3 Laborites. The popular vote was about two to one against the continuance or extension of the present policy. The charges brought against the party which has been in control in the Council were extravagance, inefficiency and the falsification of reports in order to prove that the municipal enterprises were beneficial. No charges of personal dishonesty or graft were brought against the leaders of the Progressive party. It was charged by the Moderates, or Municipal Reformers, that the enterprises of the London County Council had placed a heavy debt of $100,000,000 upon the city, and increased the rates or taxes imposed upon householders from 21½ pence in a pound to 36 pence. The enterprises of the Council which have proved failures were made the most of, particularly the steamboats on the Thames, on which several hundred thousand dollars were lost; the municipal brickmaking plant, where it cost three times as much to make the bricks as they were sold for, and many instances of extravagant and unwise purchases of supplies. The Reformers organized a great popular demonstration and a mass meeting which filled Trafalgar Square to denounce the "wastrels." Fifty men in the procession carried hods of rotten bricks from the municipal plant, and fifty phonographs attacking the extravagance of the Council took the place of the usual brass bands. The reaction against the policy of municipal ownership was due partly to the present burden of taxation and partly to a dread of the indefinite extension of municipal activity, the Socialistic candidates having put forward a very sweeping platform advocating the assumption by the city of all means of transportation, electric light and power, the supply of bread, milk and coal, and the establishment of municipal pawnshops, restaurants, saloons, hospitals, banks, theaters and clubrooms. In their reply to the attacks upon their policy the Progressives claimed that altho a great deal of money had been spent, it had been profitably employed for the benefit of the people who most needed it, in making London a healthy city and providing cheap transportations. John Burns says the campaign of the Municipal Reformers was the "most vulgar and disgraceful that has ever discredited British public life." The Progressives claim that they were defeated by "money and mendacity," and that the result of the election indicates the "profound hatred which is entertained by the clerks and the trading classes toward workingmen." The elec-

tion called out an unusually large number of voters. At previous elections only about half of the electorate went to the polls. The total number of eligible voters is 840,000, of whom 118,000 are women, who, as ratepayers, have the municipal but not the parliamentary franchise. The vote of the women is said to have been largely against municipal ownership.

Great Britain and The Hague Conference

Sir Henry Campbell-Bannerman is preparing to bring the question of limitation of armaments before The Hague Conference in a very effective way by reducing the army and navy estimates and making them also to a certain extent conditional upon the action of the Conference. He states that

"We already have given an earnest of our sincerity by considerable reductions in our naval and military expenditure, and we are prepared to go further if we find a disposition in other quarters. Our delegates, therefore, will not go to the conference empty handed."

The Premier argues that the burden of armaments is greater now than it was in 1898, and the sentiment in favor of arbitration and the peaceful adjustment of international disputes has attained a practical potency and moral authority undreamed of then. If, therefore, the question was in order in 1898, it is much more important that it be brought before the second Hague Conference, for it is now realized that there is no limit to the competitive struggle for sea power save economic exhaustion. It is understood that Germany and Austria-Hungary are opposed to the discussion of the limitation of armaments on the ground that no practical result can be obtained by the discussion, but, on the contrary, that it is more likely to produce international irritation and discord, and its inclusion would be more injurious to the prospects of world peace than its omission. Russia and France take about the same ground, but it is not probable that any Power will attempt to have the question absolutely excluded from consideration at the Conference. Great Britain, the United States, Spain and Italy will favor taking positive steps toward limitation. It is informally agreed by European Cabinets that the Drago Doctrine would be acceptable for discussion at The Hague Peace Conference.——The naval estimates for next year presented to the British Parliament provide for the construction of two large armed vessels of the "Dreadnought" type, or for three in case no understanding between the naval Powers is reached at The Hague Conference. The new naval program provides for the expenditure of $40,500,000 against $46,175,000 of last year. On April 1st there will be under construction five battleships, seven armored cruisers, eight torpedo boat destroyers, seventeen torpedo boats and twelve submarines.——Secretary of War Haldane has presented to the House of Commons his plans for the reorganization of the army. He estimates that it will effect the saving of over $10,000,000 and yet increase the number of men which can be called to the field at any moment. According to the new plan there will be two divisions, a field force and a territorial or home force. The field force of 160,000 officers and men will be ready for immediate mobilization. All the present auxiliary forces, yeomanry, militia and volunteers will be brought into one homogeneous body, uniformly trained and systematically organized. Of these there will be a special contingent of about 80,000 men, who can be called to the colors as soon as the field force is mobilized. They will be utilized for ammunition columns, the army service corps, railway work and other semi-civilian duties. Under the present arrangement only about 100,000 regulars could be put into the field at once, but under the new plan the force which could be made immediately effective would be nearly doubled. Volunteers are required to enlist for four years. If they want to resign they must give three months' notice and pay a fine of $25. The men in the territorial home service will have an annual minimum training of eight days and a maximum of fifteen.

Against the House of Lords

The House of Commons continues to pass measures which will be vetoed by the House of Lords, thus piling up the accounts against them for ob-

structing popular legislation. The most striking of these acts is the passage by a vote of 198 to 90 of a resolution in favor of the disestablishment and disendowment of the Church in England and Wales. The last time the question was brought up in the House was in 1871, when the proposal was rejected by a vote of 374 to 89. The resolution in this case was introduced by a private member, Mr. Everett, and the Government did not assume the responsibility for it, altho Mr. Augustine Birrell, Chief Secretary for Ireland, personally spoke in favor of it. Mr. Birrell said he failed to see how the continuance of the established Church could be justified. The Church had done the State no good, and the State had done the Church nothing but harm. Personally, Mr. Birrell said, he believed that disestablishment, far from harming the Church as a spiritual body, would restore it to a position of spiritual authority thruout the land. The Government's hands, however, were already too full to assume any responsibility in the matter. The bill legalizing marriage with a deceased wife's sister was passed in the House of Commons by a vote of 263 to 34. This bill has been passed by the lower house eighteen times, but has always been rejected by the Lords. The new president of the Board of Education, Mr. McKenna, introduced a bill to remove the objection raised by the Nonconformists against the present education law by relieving the local education authorities of the cost of denominational instruction in voluntary schools. It is estimated that one-fifteenth of the funds furnished to the schools by the local authorities is expended in the denominational instruction, and accordingly the bill provides that this fraction shall be returned by the managers of the schools, and in case they refuse the school will be maintained as a public elementary school. Lord Newton has introduced into the House of Lords his bill for the reform of that body. It provides that the number of life peers appointed by the Crown shall be limited to 100, and that any hereditary peer may be elected to the House of Commons. Other peers, to be eligible to the House of Lords, must be elected or have filled some important Government office. The Government has not adopted any plan of attack on the Lords.

Woman Suffrage in Italy and England

The question of woman suffrage was brought up in the Italian Chamber of Deputies by a motion of Signor Mirabello, and several members made speeches in favor of it. Signor Luzzatti, ex-Minister of Finance, said the subject was now being agitated all over the civilized world, and that it must be settled in favor of the women sooner or later. He called attention to the fact that if women had been excluded from activity England would have missed two of her greatest sovereigns, Elizabeth and Victoria. Premier Giolitti in response admitted that many laws were unfavorable to women and needed amendment, but probably the greatest present need was the improvement in female education. The question of woman suffrage was referred to a committee for investigation and report.——Premier Campbell-Bannerman has promised to support the bill introduced into the House of Commons by W. H. Dickinson to give the franchise to women. A women's anti-suffrage movement has been started to oppose the bill in the House and a petition against it, signed by several thousand women, is to be presented to Parliament when the bill comes up for its second reading. The suffragists have planned a new form of demonstration, the holding of public prayer meetings, for the success of their cause, in Hyde Park on Sundays.

The Nunciature Papers

The Parisian newspapers, especially *Messidor* and *Matin*, have been publishing what purport to be summaries of the papers seized by the Government at the Nunciature at Paris when Mgr. Montagnini was expelled from France on the ground that he was interfering with the internal politics of the country. Abbé Jouin, of St. Augustine's Church, Paris, is to be tried on March 14th before the Correctional Tribunal on the charge of distributing in a religious building a writing tending to incite rebellion and civil strife, and for uttering seditious words from the pulpit. The prosecution in the case has the use of some of the Nunciature documents. According to the published quotations, the

Pope used all his influence to prevent the visit of King Alfonso to Paris. Letters from the Papal Secretary of State, Cardinal Merry del Val, congratulate Mgr. Montagnini on the agitation against taking the church inventories, and say that the Pope is pleased with it. In a letter referring to the election of 1906 Cardinal Merry del Val advises the Catholic candidates to call themselves Republicans, explaining that the Church expects to obtain nothing more from the Conservatives except subsidies. Mgr. Montagnini writes to the Cardinal describing the efforts of Catholics to buy up the Paris newspapers *Patrie* and *Presse* for use as official organs, and he complains that Coadjutor Archbishop Amiette, who has recently been conducting negotiations with M. Briand, is too liberal. Other letters reveal the disreputable character of one of the bishops. The Vatican in reply publishes in the *Osservatore Romano* the following note:

"In regard to the alleged revelations in the Paris *Messidor* on the subject of the documents taken from Mgr. Montagnini, the secretary of the Papal Nunciature, who was expelled from France, it can be stated that the documents have been misrepresented and used to make false statements, especially against ecclesiastics enjoying the confidence of the Holy See. The manner in which the French Government has behaved in the matter is clear. When the Church refused to accept the intolerable conditions set forth in the Government's circular the Government replied by seizing the papers of Mgr. Montagnini, and expelling him from France, and now that the Church refuses to accept in the contracts for the lease of the churches conditions which are not less intolerable, it is answered with violations of right, truth, and diplomatic customs, which are respected by all civilized governments."

It is announced that the Vatican will send a note to the Powers at the Hague Peace Conference accusing France of the violation of diplomatic usage in the expulsion of Mgr. Montagnini and the seizing of the archives. The papers found in the Nunciature, bearing a previous date to the breaking of diplomatic relations between France and the Vatican have been given to the Austrian representative in Paris to be sent to Rome.

Foreign Notes

The Church has won in its struggle with the Spanish Government. Last August, during the *régime* of the Liberals, a decree was issued permitting Catholics to be married by the civil form alone. The Catholic bishops attacked this bitterly, and all Catholics who contracted civil marriages were excommunicated, and in case of death refused burial in the cemeteries. Finally the Liberals were overthrown and the King has now abrogated the obnoxious decree. This will make clericalism the dominant issue in the pending campaign. The publication by the *Diario de la Marina,* of Havana, of the charge that the United States Senators were bribed to declare war against Spain by the issue to them of over $37,000,000 of Cuban bonds created a great sensation when it was published in Madrid and is generally credited there. ——The second Duma opens in St. Petersburg on March 5th, in the Tauride Palace. So far as they can be classified, the members form three general groups —the Right, of 126 members, who will support the Government; the Center, of 164, chiefly Constitutional Democrats, who will attempt to force the Government to form a Cabinet supported by the Duma; and the Left, of 192, comprising Social Democrats, The Group of Toil, Social Revolutionists, who will use the Duma as a platform for revolutionist speeches. A raid, made by 1,500 selected police upon the rooms of the students in the Polytechnic Institute, in St. Petersburg, unearthed much revolutionary material, including twelve infernal machines, a number of hand grenades and rifles, 200 pounds of gun cotton and 400 pounds of dynamite. Several wagon loads of revolutionary proclamations and other incendiary literature for circulation in the army and among the workingmen were taken from the students' quarters. The opening of the Reichstag was marked, as usual, by a sharp debate between Chancellor von Bülow and Herr Bebel, the Socialist leader, in which the Chancellor said:

"The defeat of the Social-Democrats was not so much the defeat of economic doctrines as a revolt against the policy of terrorism. Their defeat was a punishment for their narrow dogmatism and meddling interference with the private opinions of the members of their party, by which they tried to impose on them a mental yoke such as was scarcely known during the Middle Ages. His party associates likened Herr Bebel to Cromwell and Cæsar! Oh, Julius Cæsar and August Bebel!"

Monastery Bells

By ALFRED AUSTIN
Poet Laureate of England

I.

Sometimes when, weary, the sad soul rebels
Against the strife and discord all around,
One seems to catch the faint and far-off sound
Of melody that softly sinks and swells.
It is the sound of Monastery Bells
In solitudes by sanctuary crowned,
From meditation peaceful and profound
Calling grave Friars to prayer from silent cells.
Then yearningly one craves to have release
From the world's rivalries and worthless prize,
To find some spot where Glory's selfish sighs
And struggle's endless tribulations cease,
To join in vesper chant as sunset dies,
And pass life's evening in monastic peace.

II.

But when resound, as day dawns dim and drear,
Moanings of anguish, sobbings of distress,
From hearthless homes of famished loneliness,
With none to rescue, nothing to revere,
Again one feels one still is wanted here,
To aid, admonish, comfort and caress,
Smooth the hard pillow pallid sufferers press,
Stanch the fresh wound, and wipe away the tear.
So, tho one longs as ever to depart,
And to gross sounds and sighs live deaf and blind,
Sorrowing one stays with sorrow, still resigned
To work, unhired, amid life's hireling mart,
To cherish in the crowd monastic mind,
And in a world profane a cloistered heart.

Swinford Old Manor, Kent, England.

The Village Against the Czar

BY WILLIAM ENGLISH WALLING

[This is the third of Mr. Walling's penetrating articles based on his personal observations in recent months among the Russian peasantry. In the first he showed how the peasants understand and support the radical and revolutionary demands made in their name by their deputies in the Duma. In the second he showed how far and widespread the spirit of revolution has gone in the villages. In the present article he shows how the peasants are learning to make war on the Government, and suggests what further forms of revolutionary action may be expected. The most recent reports in the Russian press more than substantiate Mr. Walling's conclusions. The well-known sociologist, Professor Novikov, states in a series of articles he is now publishing, that one of the most important of his predictions has already come true—namely, that the officials have retired from a large number of villages and are at present out of contact with the peasantry; that the "rural guards" do not dare to appear in bands of less than fifteen or twenty men, and that the relatively high officials, the zemsky natchalniki, who stand immediately beneath the governors, have in many cases retired from their official headquarters in the small towns to live together for safety in the larger places in groups of two or three. This article will be concluded in a subsequent issue.—EDITOR.]

THE threat and the imminent possibility of a costly, bloody and terrible revolution of the whole mass of the people is the driving force in Russia today. A general uprising is in the last resort the only possible goal for the revolutionary parties, it is being deliberately prepared for by the Government, and it is the only real argument with which the coming Duma can hope to influence the Czar. Whether the uprising actually does occur this year, next year or never is relatively unimportant. It is enough to shape Russian history that it is an imminent possibility. To understand the chances of the revolution, the motives of the revolutionists, the inner meaning of the policy of the Government, we must realize with all well-informed Russians that this mass move-

A PUNITIVE EXPEDITION.
The burning of a village by official order. Some soldiers are seen by the fence.

ment is, under present conditions, just what may be expected to occur; we must see just what the Government is doing and may be expected to do to prevent it, and we must know what qualities in the people and what elements in the general situation give the revolutionists the remarkable faith in the people that inspires their action.

The Government is in a feverish strain to keep the peasants out of the revolution. This is the key to every action it has taken since Witte came into power. I myself have heard Count Witte say that he expected the Duma—largely a peasant body—to be composed of Jew-haters; that is, he actually thought (or said he thought) that the peasants would send forward extreme reactionaries in answer to the call of the Czar. Here is the reason for the convocation of a body that proved to be so hostile to the Czar. A majority of reactionary peasants was expected by the Government, and this majority was to have offset the revolutionism of the zemstvos, the intelligent townspeople and the workingmen. But instead of sending reactionary representatives to the Duma, the peasants sent Aladydin and his *confreres,* and these men called on the peasants, when the Duma was closed, to revolt against a government that had "betrayed" them, was guilty of "treason," and had forfeited all claims to authority and the obedience of the people.

Not only the institution of a representative assembly, but all the other real government changes in Russia in the last two years—along with innumerable false promises of changes—have been aimed at the growing peasant discontent. Take, for instance, the new "freedom of worship." Immediately after the October Manifesto, the popular faction of the Russian Church, the ritualists or Old Believers were given religious freedom, while the Jewish and other religions remained in about the same position as before. Why were the Old Believers preferred? Because among them are fifteen to twenty million peasants. Then con-

PUNITIVE EXPEDITION IN FULL GLORY.

sider the only important change in the system of taxation. Witte had not been Minister for many weeks before the peasants were relieved of thirty-five million roubles of direct taxation on the land—and this year a similar burden has been removed. All this burden rested specifically on the peasants. While all other forms of taxation were increased, those of the peasants were lessened by seventy million roubles. Then shortly before the closing of the Duma came the gift of the crown lands—a drop in the bucket for the individual peasants—but a very real loss to the Czar. Then a few months ago the special legal disabilities of the peasants were removed. They were given, for the first time, freedom to come and go, and access to the same justice (!) as the higher classes. Finally the property disqualification—the inability of the peasants to sell or mortgage their share of the village land—has been abolished, and it is said that the village commune, along with its common responsibility to the Government for the taxes of individuals, must disappear.

All these concessions were made during or after the time of hundreds and thousands of armed peasant revolts. And what is the outcome? The peasants feel that they have forced the Government to terms. They are not grateful, as they would have been had the changes been freely granted. Thev are only crying for more. For, of course, none of these reforms hit at the roots of the evil —the peasants' poverty, the terrible indirect taxation, on which the Government lives, the oppression by local officials, the want of the least trace of individual freedom, or of that public life which can only come from local and national self-government. Besides, most of the things that have been given do not yet avail. Every vestige of new or old freedom or legal form is overgrown by a monstrous growth of military courts, military governors and political executions and exiles without trace of legal procedure. And every reality has been diluted and adulterated by a mass of false and broken promises. The whole policy and strategy, the sum of the striving of the Government, has been intended to allay the rising tide of peasant rebellion, and it has failed.

The Russian peasantry has always been an eminently rebellious people and the tradition of rebellion has been revered and kept alive for hundreds of years. Over two centuries ago, almost immediately after the institution of serfdom, occurred the revolt of the Volga pirate, Stenka Razin, in which millions of peasants took part. More than a hundred years ago half of peasant Russia was infected with the rebellion of the serfs against the masters under the pretender Pougatchev. In this rebellion hundreds of thousands of peasants died, apparently in vain, for freedom. But neither the authorities or the peasants have ever forgotten the event. As I passed thru a Volga province last summer, the peasants of a certain village had asked the priest to say a mass for the souls of the Pougatchev and Stenka Razin!

All thru the present century every province of Russia had witnessed the horribly bloody suppression of peasant revolts. In 1854 and 1855 the rebellions covered a large part of Russia and the partly enlightened Alexander II told his landlords that they must either consent to the proposed emancipation of the serfs or see it accomplished by a movement from below. Even this Czar, so autocratic in the last half of his reign, realized the power and probable will of the peasants in *extremis* to overturn the whole structure of the Russian State. The great emancipation then was accomplished neither from philanthropic motives nor from economic consideration, but from a highly justified fear of immediate revolution.

After the emancipation the peasants again showed their unwillingness to accept unless thru sheer impotence either autocracy or the well disguised shadow of reform that the emancipation turned out to be. After passing thru the hands of the landlords' commissions to which the Czar referred it, the proclamation contained neither freedom nor the even more needed land. The State simply became the master and extortioner instead of the landlord while the latter got an even firmer grip on all the better parts of the land. The following years were most busy ones for the Czar's Cossacks and dragoons. The peasantry of whole provinces was in rebellion, there was vio-

lence in every direction and there were many hundreds of outbreaks sufficiently serious to justify the call for military aid.

Never since the emancipation has the ceaseless stream of village rebellions been interrupted. Five years ago, before the Japanese war, there were half a hundred revolts in two Governments alone, and the peasants had to be mercilessly beaten and executed into submission. And last year again the spirit and fact of rebellion became general thruout the nation—more a situation that is general in the land. National crises arise. The reaction on the villages is general, almost universal—all the villages are prepared for similar action by the same events. Some village makes a desperate beginning and the outbreak spreads like wildfire over the land. To the outsider it all looks blind and wild. The observer in the village is neither shocked nor surprised. So it has come about that the spirit and manner of the peasants' revolts have kept a general

TROOPS BOMBARDING A PEASANT'S COTTAGE WITH A MACHINE GUN.

general, perhaps, than ever in the history of the Empire.

The Russian villages have never lacked the will or the courage to revolt. They have only been wanting in the physical possibility of revolting together. No army can act as a unit, divided into a hundred thousand contingents and scattered over the half of a hemisphere. Yet if not much more co-ordinated and organized now than before, the revolts have become more and more general, and more and more imbued with a common idea. The villages discuss for months and years character and have evolved together as a single movement. From year to year, and recently even from spring to summer and summer to fall, the character of this movement has changed and ripened to its present form.

The first roots of revolution go down to the very sources of the peasant nature. The Russian peasant was originally enslaved only by the utmost cruelty and bloodshed, after centuries of the same relative freedom as our Anglo-Saxon forefathers enjoyed before the Normans came. But the enslavement came a thou-

sand years ago in England, in Russia it was only three centuries ago—ten or twelve uneventful generations—and they never forgot their former freedom. The Russians were so little serfs in spirit that they attached the smallest importance to their emancipation in 1861 from a yoke they had never accepted in their hearts. The system had only succeeded in keeping alive the spirit of rebellion against all authority.

INTERIOR OF A RUSSIAN COUNTRY MANSION.
Army officers and Government officials naturally consort with the landlords.

The State religion had no deeper hold. No people of Europe so thoroly paganized the early Christianity with their own popular legends and their own true popular saints. After a certain system of religious forms got accepted, no people ever resisted so successfully the efforts of the State to assume control. Several centuries ago the Czar attempted to "reform" the Church, really to assume control of it in the name of modern ideas. At once a large part of the people excommunicated in their minds, at least, both the Czar and the church authorities and among a good fourth of the Russian people today the priest remains without spiritual authority of any kind. Many other peasants, literally millions, separating entirely from the Russian Church, have formed some of the most rational and some of the most spiritual sects in existence, never paying the slightest regard to the continuous persecution of the Government. These sects also are living things growing under our eyes. As to the rest of the peasants—the so-called orthodox—they follow the set Governmental forms and are inspired with a sincere, if broad and loose Christianity. But nowhere do they show any deep respect either for the priests or their state-directed utterances from the pulpit. Not in Catholic Italy or Protestant England is there more resistance to the Church as an institution, more independent religious feeling, more rebellion against established creed. The peasant is imbued and permeated in his religious feeling, that is in the depths of his nature by a thoro spirit of revolt.

In morality and law the opinion of the village and not that of the priests fixes the living moral code. This code is vital

and flexible, irregular and changeable, but on the whole most elevated and most humane — witness any great Russian writer from Turgeniev to Tolstoy. In the same way the St. Petersburg law is set at naught in the peasant's mind. *In fact* it must be obeyed—but only its letter, not its spirit.

It is backed by whips and bullets, imprisonment and exile, and it will not be denied. But it comes from outside the village assembly. The peasants are told by the Government not to try to understand it, but to obey. This exactly expresses their own feeling. So they obey its letter without trying to understand its spirit, and fully half of the Czar's orders are reduced to nought. The peasants are born and bred in an atmosphere of unconscious and even conscious passive resistance to both Church and State.

They were ordered from St. Petersburg not to interfere in the passing of property from father to son. But the villagers have always been accustomed to a certain form of socialism—all the land being considered at the bottom the common property of the village. When an heir had too little he was given something from the village store; when he had too much something was taken away. So the Czar's orders were disobeyed—in spite of his absolute power; his terrible Cossacks and wrath were as nothing against the quiet village will, the common and almost religious feeling of the people that all the land belongs to the community. The majority of the villagers not only equalized the shares between heirs, but they equalized landed wealth among all the families of the village. The Czar's Government seeing at every point in the present revolution the danger of this rebellious village spirit, has decided to abolish entirely the commune's control over individual property. It can be doubted if it has the power. In the village, the village meeting is the sovereign rather than the Czar.

SARATOV, AN ESTATE BURNED BY THE PEASANTS.

Before the Duma met, before even the

peasants' union had conceived the plan, the peasants' spirit of resistance had already led to boycotting taxes and recruits. Many villages had refused taxes on various grounds—disloyal to the Czar, but good in the mind of the village assembly. Many others had refused the last levies of recruits during the war. The first great revolutionary measure ever endorsed by the Russian people as a nation came neither from professional revolutionists nor any upper social class, but from the people themselves.

So when the Czar dissolved the Duma, and the representatives of all the nation wished to find a means of general national resistance, they adopted as a national measure the peasants' plan of the boycotting of taxes and recruits, and they had to rely solely on the peasants to carry it out. But they were not only endorsing the practical sense of the peasantry; they were actually adopting a proposition made by peasants at all the congresses of the peasants' union more than a year before, and adopted and spread broadcast over the land. The peasants themselves, and not the statesmen of the Duma, had decided to use this form of passive resistance as a national means of coercing the Government.

It was also the peasants themselves who discovered that this form of inactive resistance left every advantage in the hands of the Government, which, of course, did not scruple to use force. By the time the Duma had adopted the proposition, it had already been sufficiently tested among the peasantry to be rejected by them as a practical proposal. The day of passive resistance had passed and the peasants had already found other more effective and less passive ways of making their power felt.

The first and most natural action was against the landlords, who constitute the main support of the throne both in St. Petersburg and in the country. As soon as the Czar had granted the October manifesto, the peasants began to make their preparations. They argued that the manifesto must have given something of a very concrete nature to the nation at large, as was evident to them by the enthusiasm with which it had been received in the towns. They knew that the only reality to them as country people was the land. Therefore the manifesto must sooner or later enable the peasants to acquire the landlords' landed property. They began to consider themselves as the future proprietors of the landlords' estates. The latter protested in vain.

Had the landlords not lived at the people's expense, the peasants answered, and had they not stood between them and the Czar? Did they have any place in the village religion, the village morality or the village law? Had they not pillaged the peasants after the emancipation, and since that time had they not taken advantage of the peasants' economic weakness and starvation to mercilessly lower wages while they pitilessly raised rents? To take a business advantage of a starving neighbor may be good in America; it answers neither to the law, morality nor religion of the benighted Russian peasants. When the landlords heard how the peasants reasoned they began to hire armed guards. Evidently, said the peasants, they proposed to thwart the will of the Czar. The peasants would see about that.

Suddenly the latent class-hatred between the village and landlord broke out into a gigantic class war. The country side from Poland to the Urals and from the Black Sea to the Baltic was lighted up within a few weeks by the fires of thousands of country mansions—in all some $50,000,000 of property was destroyed. Everywhere the movement was similar, since it was everywhere invited by a common situation and founded on the same peasant nature. It consisted in two parts—first, the peasants moved as a village against the neighboring estate often in day-time, always with their horses and carts. They took possession of all the landlords' movable property—implements, animals and grain—and divided it in more or less equal proportions among them. They usually claimed to act either in the name of the people or that of the peasants' union. The second part of the program was almost always the burning of the landlord's house as a war measure against this common enemy of the people lest he should return and claim possession of what he claimed as his own. The landlord himself and his servants were rarely attacked. There

was little or nothing of the spirit of personal vengeance.

This was the most universal plan of action in the months of November and December, 1905. With the coming of the winter snows, all the most active movements must relax. The peasants had time to think over the successes and failures of this first plan of revolt, and on the whole it was voted a failure. Cossacks came to the villages—not to all at once, there would not have been enough Cossacks in the Empire to do that—but to one at a time; they took back the landlord's property, beat the peasants into submission, killed a few of the ringleaders, perhaps, and sent others to Siberia or the prisons in the towns. The landlords got back enough of their livestock and provisions to enable them to return. The plan had failed in every aspect. The peasants were neither on a better economic footing nor had they achieved the least measure of freedom. They had only further embittered the landlord and police.

But was the spirit of rebellion crushed by the twenty-five thousand exiles and arrests and the hundred thousand flayed backs of the insurrectionists? I was in Russia at the time and this was the mooted question among all profound students of the revolutionary movement. Had the peasants done their best and become finally discouraged? Events soon proved that the peasants had lost nothing of their rebellious instinct. They had only been forced to change the tactics of revolt. The spring had hardly commenced when a new movement, equally widespread with the last and covering nearly all the rich agricultural section of Russia, began. A strike of agricultural laborers was organized against all landlords who worked their own land, and a movement against high rents was directed against those who farmed out their estates.

A PEASANT'S EXECUTION.
The revolutionists pick off couriers and patrols from ambush.

The strike was highly organized, aggressive and violent. In all cases the action was by village, often in pursuance of resolutions of the official village meeting. In one government of the South not only were whole villages represented in district committees, but the district

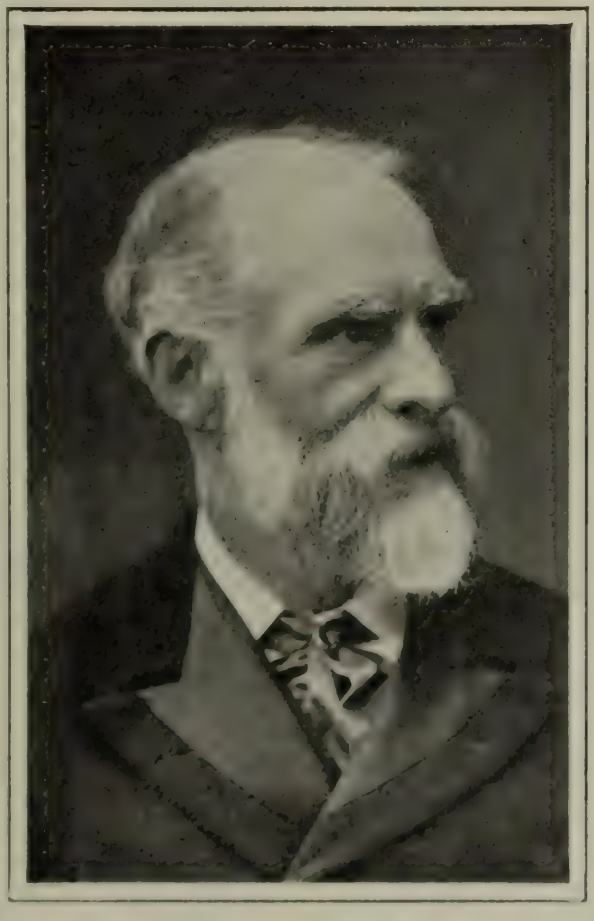
committees sent their representatives to a central convention of the whole government, of the size of an American State. The strike was aggressive because the peasants were asking for an increase of the rate of wages per hour, that amounted often to two or three hundred per cent. It was violent in that strike-breaking peasants were not only beaten by their neighbors, but often also their houses were burned over their heads. Its results were highly satisfactory from the peasants' standpoint, the rate of wages per hour being more than doubled. Peasants who were getting thirty or fifty kopecks for a twelve or fourteen hour day were often paid one or two roubles for a day of ten hours. Many crops were damaged by the delay in harvesting, and in some cases those landlords who could not afford to pay the wages demanded were told that they might sell their land to the village, but that the peasants' terms would not be lowered. The movement against high rents was equally successful, some villages in the East paying fifteen roubles where they had paid forty before.

This was the movement of the spring. The summer again marked another step forward toward revolution. The landlords had been beaten on the economic field, but they had returned more embittered than ever by their new difficulties and more ready than before to make a new use of their allies, the Cossacks and police. So after the Duma had met and it was evident even to the most credulous villages (some never had believed) that the Czar was going to grant none of the people's demands, the aggressive economic movement was supplemented by a still more aggressive attack against the landlords, who were justly blamed for a large part of the Czar's stubbornness. And this is the new turn the peasants' movement took. The principle of the boycott was applied to the landlords, their servants and the police. Every relation between the landlord and the village was made a source of trouble and even of combat. Some villages refused to pay taxes to the zemstvos in order that the landlord might be forced to build his own roads. Others refused to allow the landlord's horses and cattle even to cross the village land, or to furnish horses and lodging to the police. They beat, burned out or expelled from the village any peasant who did the landlord or the Government a service.

But this was only the first step. In very many villages the movement went much farther. Last fall the peasants were burning the landlords' mansions in the day-time. This summer they were burning their farms and granaries at night. Last fall the destruction was merely a matter of warfare. Now it is the result of a bitter spirit of revenge. This spirit has gone still farther, and very many guards and superintendents and a considerable number of landlords have been killed; also many of the village police and even members of the newly created military arm, the rural guards.

The reign of terror in some sections is already very similar to that of the towns and mining regions. Recently, in the province where Odessa is situated, fires and murders became so frequent that the Governor actually felt himself constrained to establish a *night* patrol. Does not this order indicate that the rural revolution in this section has gotten beyond the control of the authorities? Imagine the practicability of patrolling large sections of rural Russia by night! Everywhere, too, the landlords are forced to hire Cossacks or special watchmen to guard their estates—an equally impractical proposal. In some districts the nobility do not even dare to go out to pick berries or mushrooms without their Cossack guards; in others almost every landlord has left the country for the capital or provincial towns. With the sudden fall of rents in the country has gone up an equally general and rapid rise in the rents of good houses in the provincial towns.

[*Concluded next week.*]



James Bryce: Ambassador

BY SETH LOW, LL.D.

[In his preface to "The American Commonwealth," Mr. Bryce thanks Ex-Mayor Low for the valuable assistance rendered in the preparation of his great historic treatise. Now Mr. Low gives our readers this high appreciation of the new British Ambassador to the United States, who has just arrived on our shores.—EDITOR.]

IF it be a compliment to send to a country as Ambassador a man who understands that country most profoundly and sympathetically, the British Government has certainly paid such a compliment to the United States in sending Mr. Bryce as Ambassador to Washington. It is to be noted, also, that Mr. Bryce made his profound study of the United States when it was much less usual in England than it is now to give attention to matters on this side of the Atlantic. In his own person, Mr. Bryce illustrates the statesmanship that looks ahead, as well as that which studies the past. It is the unique achievement of Mr. Bryce in authorship that he has made, in his "Holy Roman Empire," one of the most profound studies of the past fifteen hundred years; and in his "American Commonwealth," one of the most comprehensive and successful inquiries ever made, by any author, as to contemporary conditions in a country not his own. The capacity to see things both as they were and as they are is a rare one, and the fact that Mr. Bryce has this gift in a very great degree is one of the chief elements in his equipment for the work he will have to do as Ambassador to the United States. He will bring to his task all of the illumination that comes from a profound knowledge of history, and all of the enlightenment that is born of a sympathetic understanding of current events. Behind all of this there is in him a genuine sympathy with men and things American, which has been the happy result of his intimate knowledge of us, resulting from his many visits to this country, his broad observation and his deep study. He early laid to heart the truth which William Dean Howells once expressed, that no European fully understands America until he learns to pardon our crudity for the sake of our earnestness. How completely Mr. Bryce has learned this lesson is shown by a remark which he made to the writer many years ago, when he said that "if American institutions had done nothing else than produce the character of Lincoln, they would have justified their right to be." This reminds me of an observation made by President Roosevelt in the writer's hearing a short time ago. We were speaking of the humorous passages in "Martin Chuzzlewit," in which Dickens described conditions in Eden, in Southern Illinois, as they appeared at that early day to the eye of the humorist. The President remarked that, after making all allowances for the humor, it was a profound encouragement to realize that out of such condi-

JAMES BRYCE.

tions came a generation that fought the Civil War to success, and, as he added, "Lincoln himself, in a sense, came right out of Eden." In other words, out of all the crudity pictured by Dickens came the earnestness which did not flinch in the times that tried men's souls, and which helped to make our country the world power that it is today. Few Europeans, if any, comprehend the significance of all this as thoroly as Mr. Bryce, and, because he does so thoroly comprehend it, his equipment for his honorable post is very unusual.

It is said that imitation is the sincerest flattery. The British Government, in sending Mr. Bryce to Washington, has followed the example set by ourselves. It has long been the habit of the United States to entrust important diplomatic positions to men of large ability in letters and public life, instead of appointing to such positions only trained diplomatists; but, in sending to us Mr. Bryce, she has sent to us a man of the type of John Hay; a scholar, a historian, and a man of public affairs. It cannot be doubted that in doing so she has paid to this country a compliment which will be appreciated; for she has sent to us the type of man that we value and understand. As to the broad principle involved, there is much to be said on both sides of the question. The trained diplomatist acquires a skill born of experience, and in some ways ought to be, and probably is, a more efficient representative of his country in its diplomatic relations. The drawback to such a man is that, by reason of the nature of his career, he lives most of his life out of his own country, with the result that, not infrequently, the country that he is representing is the country that he used to know many years before, when he lived in it, and not the country as it has grown to be by the development of the years during which he has been engaged abroad; precisely as most college graduates think of their college as it was when they were students, and realize, only in the dimmest way, the changes that have come over it since they were graduated. The advantage of the American policy is that it secures for the country, at any important moment, representation by a man of ability, who is thoroly acquainted with conditions at home, and who, in that very important sense, is better equipped to represent his country abroad than any one can be who has lived for a long period outside of the home atmosphere. Whatever may be the abstract advantages of either policy, however, Great Britain, in sending to the United States a man fresh from a long experience in Parliament, and with administrative experience, not only in the Foreign Office, but also in Ireland, has certainly sent us a man as completely equipped on the home side as a man can be. Mr. Bryce thus embodies in himself, probably to a greater extent than any other subject of King Edward, a knowledge of conditions in the country which he represents and a knowledge of conditions in the country to which he is accredited. From such an Ambassador everything is to be hoped that makes for the strengthening of good relations between Great Britain and the United States. His appointment by Great Britain can only be considered, in the language of diplomacy, as a very "friendly act," and we of the United States will give to him the welcome that is due to an old and tried friend.

If it be permitted to speak of Mrs. Bryce in such an article, it ought to be said that she is in every way well equipped to help her husband in his new work, as she has done in the old. She herself has American blood in her veins and has many friends here, and she is one of that class of English women who are thoroly interested in public affairs at home. Those who know her gladly join in offering to her a welcome no less hearty than that extended to the new Ambassador.

New York City.

The Prerogatives of the President

BY ISIDOR RAYNER

United States Senator from Maryland.

WE pride ourselves upon Gladstone's encomium that the Constitution of the United States is the most wonderful work ever struck off in a given time by the brain and purpose of man. This is not quite correct, however, for, as we all know, the Constitution was not a spontaneous production. It was the result of compromise and of violent and heated controversy. The conflict in the Convention was at one time so irrepressible and the crisis so serious that it became necessary for Benjamin Franklin, who was not renowned for his piety or celebrated for his devotion, to move that in future the sessions be opened with prayer. But we also know, emphatically, that there never was the slightest division upon the subject under discussion, and that as soon as the Convention was assembled and organized the first formal resolution that was presented read as follows:

"That a national government ought to be established consisting of separate legislative, executive and judicial departments."

From that day to the advent of the present Administration no one has ever doubted the supreme wisdom of this distinction. It is the theory toward which every other article of the Constitution gravitates as the center of attraction. It is this imperishable distinction more than any other provision which the instrument contains which makes the Constitution of the United States now read in every living language and at every university and college and seat of learning where political science is taught.

Article I says that all legislative power herein granted shall be vested in a Congress of the United States. Article II says the executive power shall be vested in a President of the United States of America. Article III vests the judicial power in the Supreme Court of the United States and in other tribunals.

This is distinctly a proposition relating to the distribution of governmental functions, and cannot be considered in the light of a grant of any specific powers. Nearly three-quarters of a century ago the greatest political philosophers who ever illustrated the pages of American history settled this contention before the Senate so effectively that it has been considered a constitutional axiom until the present day. As luminous a constitutional argument as Webster ever made was upon this precise point: that the President derives his authority from the subsequent provisions which contain the grant, and the entire grant of power; and that it is not in the slightest degree enlarged by the clause which I have quoted.

The disciples of the new school of constitutional elasticity are bewildering the mind of the rising generation upon this proposition. Why, as a matter of fact, if Congress were to pass a law today, reposing in the President a governmental function beyond the specifications of the Constitution and not necessary to the exercise of any power contained in those specifications, the enactment would be absolutely void. If the law itself would be void, what right has the President, without its sanction, to trespass beyond the confines of his prerogatives?

Either that opening clause is what it has always been held to be, simply a distribution of power, preliminary to the detailed specifications, or it is an absolutely unlimited grant of executive power.

The President is either acting under special and delegated powers, or he has unlimited executive functions. He is either a special agent of the people who must look to his credentials and commission for his authority, or he has the unlimited power of a general executive agent. Which is he?

Is it not true that there are many executive functions claimed and acts performed by monarchical rulers which the framers of the Constitution could never have intended to repose in the President, and that it was their special and obvious effort to circumscribe and limit his functions?

A great many persons who are not fa

miliar with the source of organic power are losing sight of fundamental distinctions, while they look at results and not at instrumentalities. I am not surprised at such a view on the part of the general public, who naturally think of results, with no great care or anxiety as to how they were accomplished. But I am surprised that men occupying the highest positions in the general Government and instructors and text-writers upon constitutional law should at this hour justify a doctrine which goes far beyond individual results; which strikes down at its very altar the oracle of our faith and substitutes for it a worship which can be only temporary and cannot possibly endure. The day is bound to come when the illusion will disappear, when the people will retrace their steps, and as they flee from the pagan temple they will bear upon their shoulders the Ark of the Covenant and the scroll of the ancient law.

Every word of the Constitution of the United States is written. Not a line or a letter has any one the right to insert. The Supreme Court may interpret it, it may construe it according to the spirit, but it can never add to the text. The Supreme Court may hold that a given act of the Executive is not an interference with legislative functions. It may broaden the right of the Executive to negotiate a treaty. But if it were to decide that the President had a right to conclude a treaty without the constitutional ratification, it would surely lead either to impeachment or revolution. Every judgment, decree and order which the Supreme Court renders must be under and not above or beyond the Constitution. It can set aside an act of Congress, but it cannot abridge or extend the limits of the charter. And what the Supreme Court cannot do by expression the Chief Executive ought not to be allowed to do by implication.

The President has the constitutional right to veto any act of Congress, but he certainly has no right to use the vast public patronage at his disposal to compel obedience to his views. He has no right to make compacts with the Speaker of the House of Representatives or its committees to accomplish the legislation he desires or to prevent legislation. Beyond his messages, in which he is given the right at any time to suggest such measures as he may deem proper or necessary, he has no right to interfere with legislation, to force Congress either to adopt his recommendations, or, if it rejects them, bring about a breach between the legislative and executive departments that is detrimental to the best interests of the country. It constitutes an assumption of dictatorial power to which the people of this Republic will, in the course of time, refuse to submit.

I care not how great the achievement or how much the result may conduce to our progress and welfare; I care not what benefit, advantage or prosperity we may derive from the accomplishment, the principle is dangerous. The new sect of political scribes who advocate the righteousness of these things have commenced to edit a revised edition of the Constitution. They call it the unwritten Constitution. They are framing an apocryphal collection of epistles and promulgating their heresy from academic chairs and lecture platforms. They do not propose to add any additional chapters to the original manuscript, but they insist that under the general welfare clause, which is only a repetition of the phrase which was used in the Articles of Confederation, this Government has implied powers which are not enumerated in the charter. When they approach the Executive Department the implication becomes unlimited. Under their distribution of executive power the President can perform all functions not directly allotted to the other branches of the Government.

It is true that Congress can and has enacted a great many laws enabling the President to perform the duties confided in him by the Constitution, and that he is given the broadest discretion within which to adopt and exercise whatever methods are proper for the purpose of carrying out the powers which are granted to him. But he should never abuse his constitutional prerogative by invading the domain of the other departments. He should never, under color of title, assume authority upon subjects which have no relation to his office and do not in the remotest degree appertain to the performance of his executive functions.

Day after day Congress is struggling with questions of constitutional law, as

if it really had anything to do with their settlement, laboring under the vain delusion that it has the right to legislate; that it is an independent branch of the Government; that it is one department and the Executive another, each with its separate and well defined distinctions; imagining these things and following a vision and a mirage, while the President is at work dominating the legislative will, interposing his offices into the law-making power, assuming legislative rights to a greater extent than he could possibly do if he were sitting in the Senate Chamber as a member of this body; dismembering the Constitution and exercising precisely and identically the same power and control as if the Constitution declared that Congress shall pass no law except with and by the advice and consent of the President; adopting a system which practically blends and unites the legislative with the executive functions.

It is a system which has prevailed in many of the ancient governments that have forever gone to ruin. It is a system which still obtains in governments, the rebellious protests of whose subjects are echoing over the earth today, and whose tottering fabrics I hope are on the road to dissolution.

I earnestly deprecate this tendency to override the organic law of the land, proclaiming to the world that while the other branches of the Government are controlled by the Constitution, the Executive is above and beyond it, and that whenever his views and policies conflict with it he will find some way to effectuate his purposes unrestricted by its limitations.

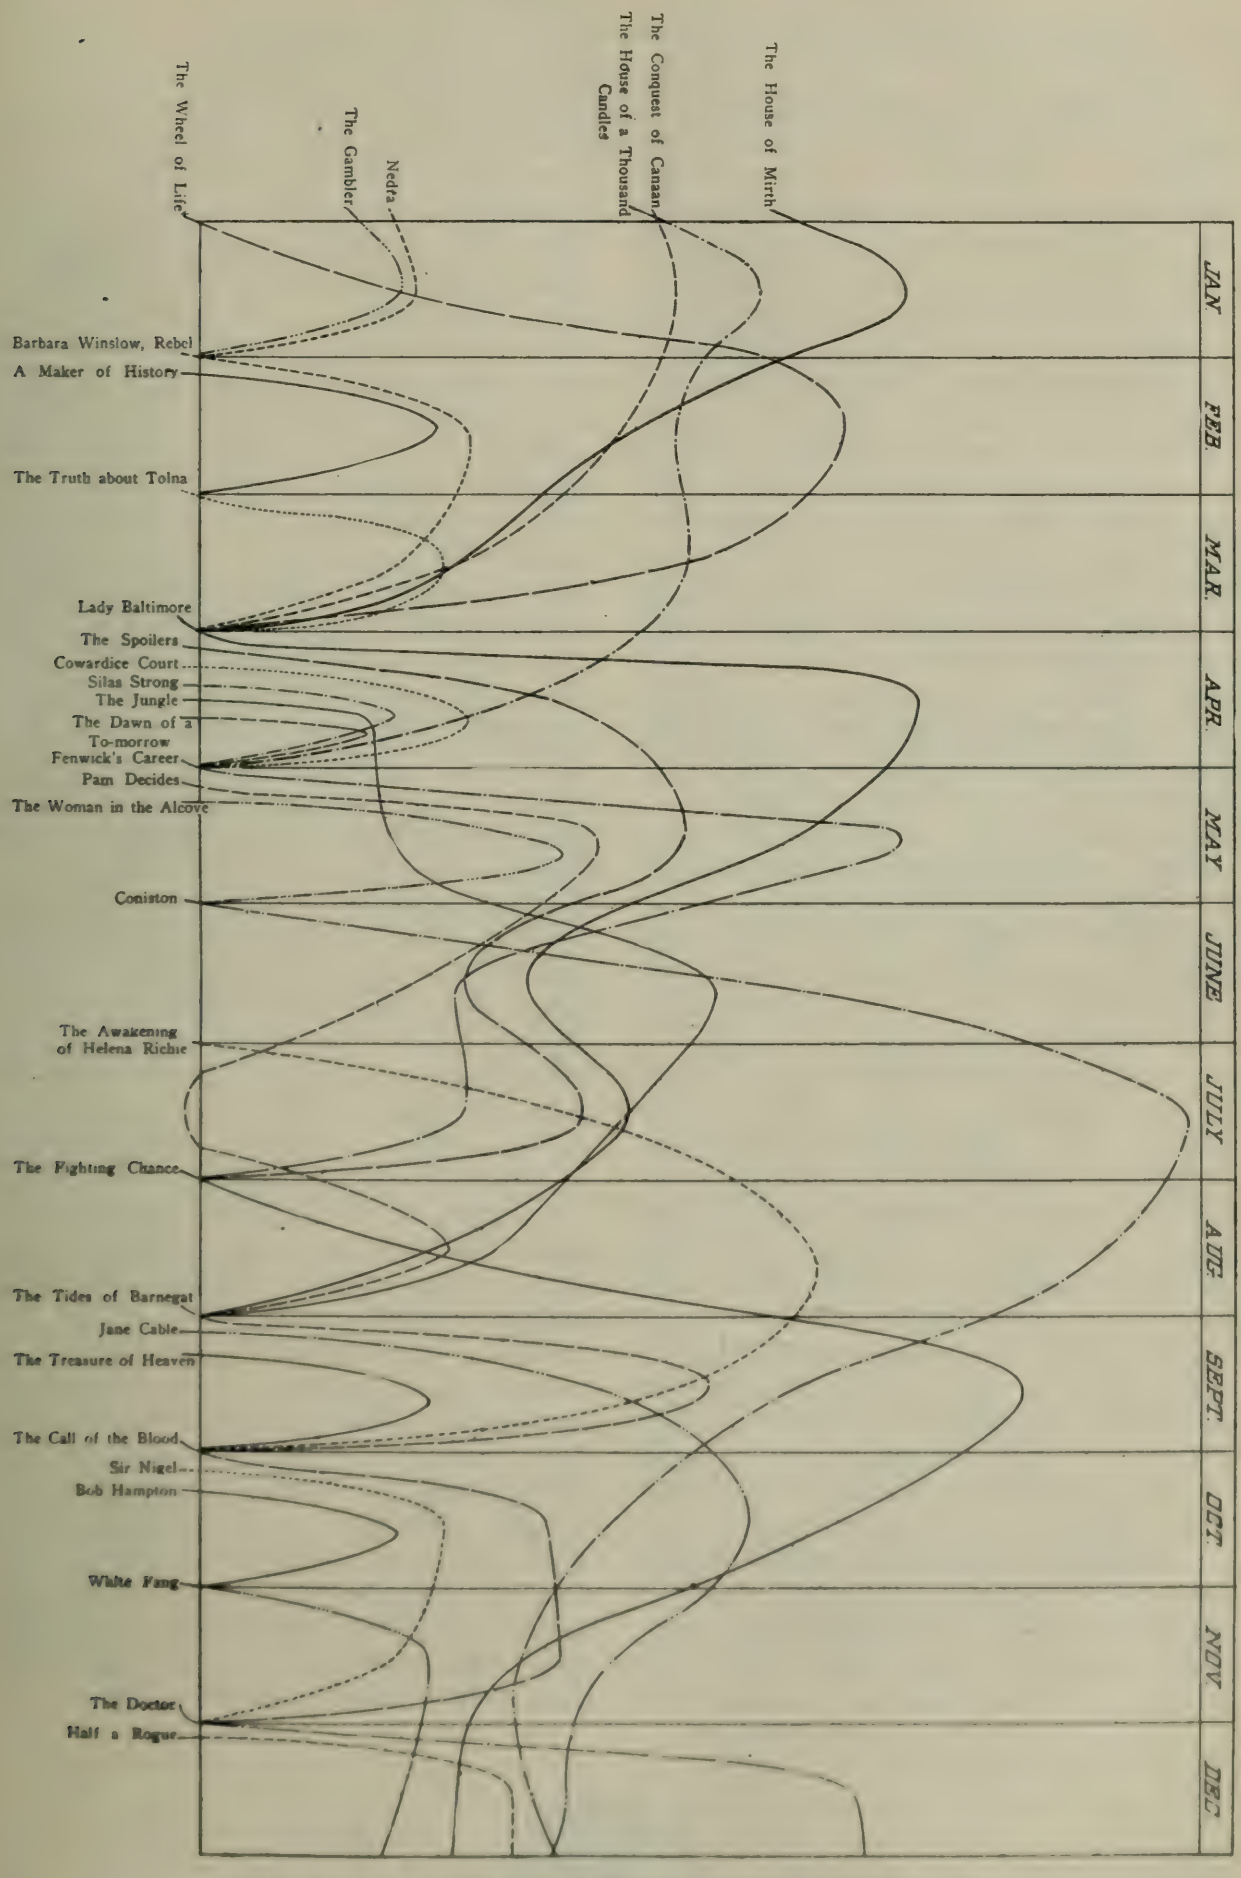
It is but another step to visit upon the judiciary the same influence which is now felt by the legislative department. Already there has been a hint even of that, in the President's criticism of Judge Humphrey. I am inclined to think that Judge Humphrey's decision was correct and would have been sustained on an appeal if an appeal could have been taken; but, right or wrong, it did not come within the functions of the President to reprove the judge or animadvert upon his opinion.

Is it possible to imagine a condition more intolerable than a system under which the judiciary should feel that their judgments and sentences must conform to the wishes of the Executive, and that if they are objectionable to him the judge is to be subject to his censure and reproof? In the past history of the common law this system has made the arm of Justice the adjunct of the Crown, to fortify the abuses of the tyrant and suppress the liberty of the subject.

I know how often it is said that people do not care what means are used, what methods are followed, whether the Constitution is violated or not, if the result accomplished is for their benefit—the end justifies the means. I do not believe it. I do not believe the people favor tampering with the Constitution and by insidious inroads upon its provisions paving the way for a dictatorial government.

The division of governmental power into legislative, executive and judicial functions is the arch that supports the Constitution. Underneath it is the chasm in which every government of the past ignoring the distinction lies buried in wreck and ruin. Weaken the arch and the entire fabric will crumble. Keep the keystone inviolate and the majestic structure

"Shall time defy,
As rocks resist the billows and the sky."



WASHINGTON, D. C.

The Rise and Fall of Popular Novels During 1906

BY MRS. L. H. HARRIS

THESE are hard times. The literalists are determined to hamper us by the facts. We shed them like feathers everywhere, only to find at the end of the year that they have been classified and we have been numbered and set down in the table of universal statistics. Even the most irresponsible of all created beings, writers of fiction, have not escaped. Not that any one cares for more than six weeks about any books they write, but the matter for record is, How well did they sell, and is the author still on the list of the six most popular writers in the country? This would have led to much complimentary discussion and might have divided the honors among a dozen or more novelists, but unfortunately the *Bookman* has been keeping the score with mathematical accuracy for the past seven years. And we find that Winston Churchill is the only one mentioned there among the ten most popular writers who still holds his own in this year's list. At the beginning of 1906, according to the same authority, "The House of Mirth" was "at the top with 263 points, 'The Conquest of Canaan' following with 183 points." These are correct "quotations" from the live stock market of fiction. Apparently the idea is to show the worth of the human imagination in dollars and cents. And the author's worth is gauged by the number of his books sold during a given period, altho that may really indicate his worthlessness. Nothing is said of the reason why these were the most popular novels, because that would be merely speculative and has nothing definite to do with the business. And it is the business that counts. But when we consider that "the public" which we speak of in such general terms is divisible into many common factors, and that the class of people who are responsible for the popularity of one book have little or nothing to do with the success of another, it is at least interesting to consider some of these differences of taste.

Ellen Glasgow, for example, whose "Wheel of Life" was another novel widely read at the beginning of the year, owed her popularity to what one publisher told me was the "highly respectable, but unintelligent middle class," for Miss Glasgow never had an idea that was original, but they are all "moral," like the plays we see at the Thalia Theater on the Bowery. As for George Barr McCutcheon and Meredith Nicholson, they are men who know how to tell a tale man fashion even if they break every law of nature to do it, and that is reason enough to account for their success. But Mrs. Wharton's novel requires a different explanation. Long ago some one said that she had "distinction" of style. It is a kind of greenroom distinction now; that is, too distinct. Besides, "The House of Mirth" indicates that she has become a gossip about the doings of the debauched rich, with exactly that pietistic air of reproach which all gossips have. What she writes is not exactly the truth, it is the neurasthenia of the truth, which is different and sells better. Now, the people most interested in this kind of scandal are comparatively poor and morally respectable. If you want to know the worst about the rich, ask their grocer's wife. This brings me to the point. "The House of Mirth" was very widely read because there are so many people in this republic, male and female, with the grocer's wife's curiosity and point of view. And they are not the same readers who lifted "The Conquest of Canaan" to "183 points." How Tarkington manages it nobody knows, but there is a moral sanity, a whimsical upward push, a tearful, half intoxicated adoration for goodness and beauty in all that he writes, which makes his books irresistible to people who have the heroic instinct and a witty understanding. No other novelist among us holds hands with Heaven behind Satan's back so cunningly as does Booth Tarkington, and the gift makes his books sell like half-inspired

THE RISE AND FALL OF POPULAR NOVELS DURING 1906.

Based on the *Bookman's* tabulation of trade statistics of the six best selling books in each month of the year.

psalms in a world where there is still a confused hankering after prayer and forgiveness.

The accompanying chart, which not inappropriately resembles a chart for showing the rise and fall of a sick person's temperature, is of interest because the lines on it indicate more clearly the rise and fall of popular novels during 1906. Of the ten which attracted most attention in April and May, "Lady Baltimore," "The Jungle" and "Fenwick's Career" are the most important. The latter undoubtedly sold upon the author's reputation, but this is not the case with the other two. An English teacher in a great college objects to Owen Wister's story because "the technique is faulty and the form bad." I quote this to indicate why young people who hope to write should never take the average professor in English too seriously if his mind is founded upon nothing better than a high school grammar and a sophomore rhetoric. A corpse may have the coffin technique of stiffness and be of perfect form, and yet be fit only for worms to devour. That which gives "Lady Baltimore" a unique place is the quaintly sweet, half heroic, half bombastic *life* of the characters in it; and that rare peace of the earth in it as if she had turned upon her side toward the sea and the sun to rest and dream and bloom. "The Jungle" defies definition, except upon the grounds that horror is a motive that is almost universally fascinating. People of all classes read it because they heard that it would make their gorge rise and their hair sit up—and it did. Sinclair says that he aimed at the heart of the world and hit its stomach. Any one but Sinclair, whose literary sense of direction is not his strong point, would have known where such a blow would land. And even those of us who do not like to be made sick at the stomach must admit that it is the one novel of the year—or of the years, for that matter—which resulted in any kind of actual reform.

The unrivaled popularity of "Coniston" is due to some conditions as well as to the fact that it is a story of unusual literary merits. In the first place, it came out during the vacation period, when it will be seen, by referring to the chart, that all the notable novels had an increased sale. Then Mr. Churchill was a kind of romantic candidate for the Governorship of New Hampshire. And it may be that his too numerous opponents bought the book, read it and made sad inferences from his astonishingly intimate interpretation of a character like Jethro Bass. People in a political campaign are apt to miss the literary point in a work of art for the sake of their own argument. Some of us who read Margaret Deland's novel wonder why it was not more popular. For one, this writer thinks that many who did read it missed the author's meaning. Besides, the whole world is playing "hooky" now and refuses to be chastened just yet for its sins, as the good old Dr. Lavender tenderly chastened Helena Richie for hers. "The Fighting Chance" is a better book than "The House of Mirth," altho the author deals with nearly the same class of satin-shod sinners whom Mrs. Wharton thinks she knows. But its popularity probably depends in a great measure upon the same ignoble curiosity of good people.

The rising curve of "White Fang" is strangely short when we remember how popular Mr. London's books were only two years ago. Very likely this is as good as any work he has ever done, but the trouble is with Mr. London himself. In his effort to be a socialist he has kicked off too much of his own social breeching. Nothing makes a man more commonplace. People do not take the same romantic interest in him now that he has become a sort of bloody-headed political factor. Writers of fiction should be very careful how they connect themselves with even figurative "revolutions" and more figurative "world movements." It is very crass and usually fatal.

NASHVILLE, TENN.

The Struggle Against Tuberculosis

BY PROFESSOR E. VON BEHRING

[Since the following article was received the cable announces that the "Royal Commission on Tuberculosis," which was appointed in August, 1901, and over which Sir Michael Foster presided, has just issued a long report which holds that cow's milk, in the majority of cases, is responsible for tuberculosis infection. This supports Professor Behring's present article, but for our comment on his theories we refer the reader to our editorial pages. —EDITOR.]

"BY what remedies and methods can we, at the present time, alleviate the sufferings which the Koch tubercle bacillus causes in man?" Before I attempt to answer this question from my own standpoint, it will be well to consider first the history of the tuberculosis-producing virus in the human organism. Like Proteus, the tuberculosis virus in the human being leads an existence of changing forms. The virus represented by the Koch tubercle bacillus increases at the expense of the physical forces of the human organism, produces poisons and leads to death, if there is no opposition to the production of the poison. Generally, however, the human organism reacts and wages a kind of warfare against the entrance of the tuberculosis bacilli. These bacilli are enclosed by cells (*leucocytes*). A second cellular wall is formed around the first, and then a third, and so on; but the inner walls collapse in time when the inner tumor, which we call a tubercle, becomes larger. These tuberculosis centers then form suppurating cavities, which spread continually as gnawing ulcers and cause destruction in all forms of tissue. It is to these ulcers we owe the words *lupus, cancer, carcinoma, noma*, etc. The terms *noma, carcinoma, cancer, chancre,* however, have been for a long time applied to such disorders of the tissues as are not caused by the tuberculosis bacillus, but by other infectious material. Only the word *lupus* has remained as the technical term for tuberculosis, but only for the ulcerating process on the exterior skin, and especially on the face. As a matter of fact, in tuberculosis, it is always a question of the formation of ulcers and the ulcerative process. Even the well-known lung cavities are only ulcers in the lungs.

Foes of tuberculosis, however, can be restored, more or less, to perfect health. They can become calcified, they can cicatrize, and even disappear entirely, being replaced by healthy tissue of exactly the same nature as that in which the ulcer originated.

Because of the variation of individual cases, and the great difference in its localization, in spite of its existence for countless ages, the origin and development of tuberculosis were not understood until recent years.

Chronic pulmonary consumption, catarrh of the lungs, cheesy pneumonia, miliary and *submiliary tuberculosis, scrofula, lupus, caries* and *necrosis, tumor albus, intestinal consumption, inflammation of the peritoneum* (*peritonitis*), *of the pleura* (*pleuritis*), *of the cerebral membrane* (*meningitis*), formerly were all treated in different chapters in medical books. But now we count them, for the most part, as tuberculous, since Ariadne's thread has been found to guide thru the labyrinth of pathology, in the form of the discovery of the tubercle bacillus by Robert Koch twenty-six years ago.

To have discovered the tubercle bacillus, to have established its nature and the possibility of its breeding, is *one* of the great works of Koch in tuberculosis. It was a difficult task to accomplish, and without the methodical work of that great investigator in this field, it could not have been brought about. The second great work of Koch, however, was more difficult still, and, in my estimation, more important for all future studies in tuberculosis of an ætiological and therapeutic kind, namely, the discovery of *tuberculin* sixteen years ago.

Tuberculin is a substance, soluble in water, produced from the artificially cultivated tuberculosis bacillus, which operates quite differently on animal organisms after tuberculous infection than it did before. A small portion of tuberculin, which would be quite harmless for an individual in an uninfected state, may, after tuberculous infection, cause disease and death.

On account of the diagnostic tuberculinizing of the soldiers in several Bos-

nian regiments by the Austrian military physician, Franz, together with many other systematically conducted experiments, it is now known that "to be infected with tuberculosis" does not mean so much by far as "to be consumptive." Many people who feel and remain healthy react to tuberculin, and thereby demonstrate that they have been or still are under the influence of a tuberculous infection, without ever suffering from diseased lungs.

But those results of the tuberculin investigations are of the greatest importance which prove that the tuberculin reaction is a reaction of immunity, and is necessitated by the formation of protective forces and salutary opposing bodies in the organism of infected individuals.

With this assertion I have arrived at the boundary which separates Koch's sphere of investigation from mine, and where the roads divide in the science of the beginning, duration and cure of tuberculosis. And all those who would help in solving the present phthisiogenetic problems have the choice of either marching with Koch in opposition to me, or with me against Koch.

I will now try to make clear in as few words as possible the principal differences between Koch's standpoint and mine on the tuberculosis question.

1. According to Koch the cause of most cases of tuberculosis in human beings is due to breathing air containing tubercle bacilli thru the larynx into the lungs. In opposition to this view, I assert that in so far as epidermiology is concerned, a person rarely gets consumption in this way. Rather, such individuals get consumption who have had the germ of the disease brought into their bodies with the milk in childhood. Further, the milk bacilli work thru the medium of the digestive organs and lymphatics and thus into the blood, and generally the lungs are infected by the blood. Finally, such tuberculosis bacilli as are inhaled with the air or reach the mouth and nostrils by infection, first go round by way of the lymphatics and blood vessels before reaching the lungs.

2. According to Koch's teaching, the tubercle bacilli which enter into the human organism thru cow's milk are not capable of producing tuberculosis and consumption, while I assert that the tuberculosis bacilli originating from cows are not only as dangerous as, but more dangerous even than, those originating from consumptive persons.

If, as I believe, in the majority of cases, human pulmonary consumption is due to anthropogenetic (of human origin) tuberculosis virus, it is of no consequence that this possesses a higher degree of power for creating tuberculosis than the taurgenetic (originating from oxen) tuberculosis virus. But it is a matter of importance that the chance of infection by anthropogenetic virus is more often presented to human individuals.

3. Koch regards infection in adults as the most powerful cause of the origin of pulmonary consumption. I maintain that the decisive tuberculosis infections occur in childhood. Indeed, in most cases where consumption develops at a later period in life, I assert it is the result of germs acquired in infancy thru the medium of the mother's milk, the nurse's milk, or with cow's milk in the bottle—in a word, as babies. And once more I would reiterate what I have so long maintained, *"Babies' milk is the principal source for the origin of consumption."* And, *"Consumption is the last verse of the song which is first sung to the suckling in infancy."*

4. According to Koch, tuberculin is a certain means of determining whether a person is tuberculous and may be expected to die of consumption.

My own investigations, on the contrary, prove that we can indeed determine by means of the Koch tuberculin whether a person is or has been under the influence of tuberculous infection, but the establishment of a hyper-sensitiveness with regard to tuberculin is by no means a proof that the person possessing this hyper-sensitiveness harbors tubercle germs in his organism. For, by experimenting with animals, we can produce the highest degree of tuberculous sensitiveness, and still not find the slightest tubercle on dissection. This is regularly the case in vaccinating infections with relatively weak tuberculosis virus.

5. In Koch's plan for fighting tuberculosis, the removal of tuberculous sputum is of great importance. He is of the opinion that by this means the disease will finally be extirpated. According to my idea preventing the sputum from turning

to dust should not be neglected, and the public should be taught not to soil the floor of dwellings, railway carriages, tramcars, etc. Soiling linen with the matter ejected from the lungs, is to be avoided also, even for æsthetic reasons, but the principal source of consumption, viz., babies' milk, cannot be stopped by prohibition of spitting or sputum disinfection.

6. The means for counteracting tuberculosis in cattle published by me in 1901 by an immunizing treatment of calves with the help of weak, tho virulent anthropogenetic tubercle bacilli, was recognized even by Koch some years later, and was put into practice. However, Koch's views and mine are diametrically opposed as to the scientific bases of bovo-vaccination. According to Koch the human tuberculous virus is of a different kind from bovine, and as a consequence of this difference, is capable of immunizing cattle, from which it follows that for immunizing human beings, the bovine virus could be successfully employed. I must consider as a grave and very dangerous mistake, this teaching which encourages and recommends the use of bovine-phthisis virus for therapeutic attempts in human beings.

7. The official sanitary and legal organizations, advised by Koch with regard to the feeding of children with cow's milk, have generally taken the position that suckling infants and children fed on milk are not exposed to an infection from cow-milk tubercle bacilli. I must oppose also this consequence of Koch's theory as leading to error and being extremely dangerous.

With regard to the treatment of human tuberculosis the tuberculin treatment of Koch must stand in the first place for curing new cases of pulmonary tuberculosis. But I consider my new tuberculosis remedy, "Tulaselactin," of the greatest importance as a means of immunity among babies.

It must be left for the future to decide the outcome. My program for an effective treatment of human tuberculosis is taken from the experiments with animals, which have given certain indications of the value of tulaselactin with regard to the treatment of human beings. Here, I can only point out the following indications:

First—It is still doubtful whether such stages of tuberculous disease as come under the head of pulmonary consumption can be favorably influenced by tulaselactin.

Second—By means of intravenous, subcutaneous, and stomachic application of tulaselactin, not only can tuberculous cattle, pigs and sheep be protected from infection, but what is more difficult, even rabbits and guinea-pigs may receive a considerable degree of protection against tuberculosis if the subcutaneous treatment of these animals is begun with 3-10 milligramme of my tulaselactin and the dose gradually increased for fourteen days.

Third—The highest degree of immunity is not to be expected till from five to twelve weeks after ceasing the immunizing treatment.

Fourth—The immunizing tulaselactin treatment is to be judged in exactly the same way as that immunizing method which I called "Mithridatizing" in previous works.

Fifth—The advance of the immunizing process is checked by the quantity of protective matter in the blood serum, with mithridatized individuals.

Sixth—The protective matters that I have discovered go from the blood into the milk, and it is therefore possible to immunize the young animals by feeding them with the milk of animals treated with tulase, or with the milk of their own mother, if it has previously been immunized against tuberculosis.

Seventh—It is still to be determined by continual experiments with animals whether, for practical purposes, the protection of the young animals by means of immunized milk is preferable to a mithridatizing treatment. We may assert, however, that the mithridatizing treatment is followed by immunity of longer duration.

Eighth—Such animals as appear hypersensitive to tuberculin, after diagnostic injection, and which therefore prove that they are infected with tuberculosis, can be successfully subjected to the mithridatizing tuberculous method of immunizing; but they must be in a good state of nourishment and the clinical research must show no manifest tuberculosis disease. Accordingly, I expect that even persons who react on tuber-

culin, if they are not yet phthisic, can be cured and rendered immune against tuberculosis by means of the tulaselactin treatment.

Ninth—The question whether tuberculous individuals can be freed from tuberculous infected lungs by means of the mithridatizing tulaselactin process, can only be answered with certainty after extensive therapeutic statistics.

Tenth—Cows, in a good state of nourishment, which showed no other signs of tuberculous disease but the secretion of tubercle bacilli with the milk, rabbits proved by experiment to have ocular tuberculosis, pigs with tuberculosis in the glands, and guinea-pigs with chronic pulmonary consumption, were successfully treated by me with tulaselactin. From these therapeutic experiments I have the right to recommend a tulaselactin cure in similar cases with human beings.

In short, as a result of all this, we may assert that in all probability tulaselactin will play a useful and practical part in the treatment of scrofulous diseases, especially consumption, in the shape of a preventative immunizing effect on milk.

My observations on animals show that the principal source of infection is in the dwellings of consumptive families. Interiorly and exteriorly the newly born child, in the first weeks of its life, is only pathologically as vulnerable as an adult. We can only protect the child of a tuberculous family from tubercle bacilli by taking it away from the mother, by removing it from the tuberculous infected dwelling, by transferring it to some place that is free from tuberculosis, and by feeding it on milk that is free from infection.

In rich families, who have roomy dwellings at their disposal, these instructions can be followed in various ways. But for the great mass of people it is quite impossible to protect children in a consumptive house by any prophylactic means so far recommended. The only rational method of protection is to remove the child to a house that is quite free from tuberculosis and to feed it with cow's milk free from tubercle bacilli.

The question of removing the child that is threatened with tuberculosis from infected rooms to a place free from tubercle bacilli is, of course, closely connected with the dwelling-house question, which has been so much discussed lately, and the realization of which is now beyond any doubt. But another method can be and is tried in many towns in Germany for the purpose of protecting young children. Babies' homes, and the milk kitchens, are formed for the purpose of taking newly born children from phthisic and tuberculous homes where the parents are in poor circumstances, and rearing them healthily instead of waiting till they are infected with tuberculosis, and by scrofulous symptoms, atrophic conditions, *Tabes meseraica,* catarrhal, meningitic and other diseases, show that the tuberculous virus has begun its work of undermining health and youthful strength.

I destined tulaselactin in the first place as a preventive treatment for children free from tuberculosis, and only secondly as a curative treatment for children infected with tuberculosis. Lastly I destined it for theoretic experiments in cases of manifest tuberculous infections which we divide as scrofulous forms, as pulmonary tuberculosis and phthisis, and which besides manifest themselves in separate organs and parts of the body, in the many various forms already described. In order to introduce tulaselactin into medical practice, I had to go the roundabout way of treating phthisis with tulaselactin and therefore have not yet got to my real object, the preventive treatment of newly born children.

I have already mentioned that I have not as yet convinced myself of the therapeutic worth of my remedy thru experiments on human beings, but on animals. But we can never know in advance whether that which is valuable as a remedy for cattle has the same value for human beings. Indeed, we know for a certainty thru the epoch-making work of Koch, that human beings behave quite differently from guinea-pigs and other animals with regard to remedies produced from tuberculosis virus. If any one tried to come to the conclusion that because a dose of 100 milligrammes of a remedy derived from tubercle bacilli was harmless for a guinea-pig, therefore it would be harmless for mankind, and if he consequently tried therapeutic experiments on human beings, he would soon find his conscience loaded with the knowledge that he was shortening the lives of

his patients and injuring their health. Nevertheless, a remedy destined for the treatment of human diseases must somehow and somewhere be tried for the first time on men. I have received offers from all over the world from consumptive people to treat them with my remedy without my taking the responsibility for any evil effects. But I have never received any offers from healthy people to treat them with my remedy with a view to preventing tuberculosis. Especially no consumptive fathers or mothers have had the idea to request me to inoculate their children to prevent the tuberculosis that threatens them. But the contemplated preventive inoculation of children is of importance for me, and what is more, of children at the earliest age, for the older a child becomes, the less we can reckon on its being free from tuberculosis and fitted for preventive inoculation.

A preventive remedy for tuberculosis can only find favor among healthy people, when they are not only convinced of its effectiveness and harmlessness, but when they realize the greatness of the danger.

There are not only families but whole districts where this danger has been quite realized on acount of the statistics on the subject. But, so far, there have been quite false ideas regarding the time when the work of the consumption germ begins. The commencement of the infection is not the age of the puberty when the *habitus phthisicus* tries in vain to produce a disposition for tuberculous infection, not yet the time of the scrofulous diseases of children, but it is in reality the earliest age of childhood. *Phthisis incipiens* and scrofula are nothing but the manifestations in early childhood of the later tuberculous infection.

So I had to begin my preparatory work by urging (thru the medium of lectures and published articles) on the earliest age for the period for commencing the preventive treatment, if we are to count on similar success to that attained by Jenner's system of vaccination for small-pox. And, as I have proved with my experiments on animals, especially calves, in this manner a lengthy immunizing is possible and practicable for tuberculosis as well as for small-pox.

BERLIN, GERMANY.

"DOUBT."

The above picture represents a large piece of sculpture in marble, the work of Henri Cordier, a well-known French contemporary artist. It was exhibited at the last Paris Salon and the author expected it would be bought by the State. But the French Minister of Fine Arts objected that the old man in the work was a portrait of Voltaire and consequently the sculptor was criticising the Government—a curious example of the way the religious question just now enters into everything in France.

Mr. Rhodes as a Historian

BY WILLIAM GARROTT BROWN.

Author of "The Lower South in American History," Etc.

WITH the sixth and seventh volumes, issued together, Mr. James Ford Rhodes apparently makes an end of the work which he originally called "A History of the United States from the Compromise of 1850."* On the title pages of these new volumes that title is completed with the words, "to the Final Restoration of Home Rule at the South in 1877." This date, Mr. Rhodes tells us in a preface to Volume VI, he has decided to substitute for 1885, which he had originally chosen for the limit of his work, and I think it is true that 1877, as marking the end of what may be called the North-versus-South period of our history — the period, that is to say, in which the great sectional controversy dwarfed all other issues—is a better stopping place than 1885, which was chosen as marking the return of the Democratic party to power in the nation.

But it is not certain that Mr. Rhodes has laid aside his pen for good. By the language of the preface to Volume VI he leaves himself free to go on with his story when he shall have made the preparation which he thinks he needs for dealing with the problems of our more recent past.

However that may be, he can pause from his labors in the certainty that no serious student of American history can afford to neglect what he has already done. He has completed a task which, in view of the ever-increasing difficulty of thoroness in history, owing to the ever-increasing mass of accessible material, might well be considered enough for one lifetime. He has written what is, on the whole, the fullest and the best account we have both of the Civil War and of the period of Reconstruction.

I wish that the number of serious students of American history were great enough to make for such a work a large public; or, to put it slightly differently, that the interest in history extended more widely thruout the present reading public. Apparently, there has been a growth of interest in history in recent years. Many new historical societies have been formed. In the colleges, chairs of history have multiplied. In the publishers' lists, titles in "history and biography" fill much space. But I do not think that formal histories have gained much in popularity.

Perhaps the reason is that not many works which, *populo judice,* can be called great histories, have been written of late. There has not appeared recently—that is to say, since the scientific, "laboratory" methods of studying and teaching history established themselves in the higher places of learning—any dangerous rival to Thucydides or Tacitus or Gibbon or Macaulay. The coming of such a personage is, of course, not a thing to be accounted for, and he appears too rarely to make it reasonable to assign reasons for his non-appearance. But there are, I think, two tendencies in most recent history work which are decidedly unfavorable to the production of great history books,—that is to say, of histories which are great books.

One of these is the tendency to specialization, which has fruited in countless monographs and has led naturally to the assembling of monographs in what are known as co-operative histories. The co-operative history doubtless meets some needs of scholars, and may perhaps also, in time, find its way increasingly to the book shelves—or the center tables—of that other class of book buyers who make their purchases chiefly from the peripatetic agents. But it does not bid fair to make much trouble for the latest novel, or even to deprive the old-fashioned literary history, all written by the same hand, of such favor as it may still enjoy. I call that kind of history old fashioned because the second tendency I have in mind is to dissociate history

* History of the United States from the Compromise of 1850. *By James Ford Rhodes.* Seven vols. New York: The Macmillan Co. $2.50 per volume.

from literature. Time was, when to call a man a historian implied that he was a man of letters. That is at present hardly true.

The two tendencies are more closely related than may appear at first blush. They both, I think, spring from the same general inclination among workers in history; an inclination which manifests itself in the preference for accuracy in detail over brilliancy or wisdom in generalization, and for the witness of documents over the more intuitional sources of enlightenment about the past. They are merely two signs of the same movement; and that movement, I take it, is in fact a movement along the line of least resistance.

This last phrase needs both explanation and proof; but I will be brief.

I suppose it will be admitted that the rarest and highest of gifts is the gift of creative imagination, in the form in which it enables its possessor to achieve great works of art, and that your really great historian, certainly your great literary historian, must, equally with your great painter, sculptor, poet, novelist, dramatist, possess that gift. But still rarer than the possession of that gift alone is, of course, the combination of it with those other gifts and qualities—industry, good judgment, patience, fairness—which the historian also requires. It is no wonder, therefore, that great history books are extremely rare; rarer than great books of any other kind. I am not sure but that they can be numbered on the fingers of one hand. Nor is it strange that, since the great majority of men who go into history are without the gift of creative imagination, they should stand, more or less consciously, for an unimaginative, unliterary way of

JAMES FORD RHODES.

studying and teaching and writing it. To look a bit deeper still into the matter, it is not strange that, once scholars of this character have possessed the field, and have worked out for themselves creditable careers as writers and teachers of history, the seminaries and other advanced courses in history in the universities should come to attract, more and more, the student of plodding industry and a prosaic habit of mind, and correspondingly to repel him of the lit eye and the winged words. This, certainly, is the impression I have got from a good many years of observation of the life of universities.

I use this approach to a glance at the work of Mr. Rhodes because I fancy we may in this way come to see more readily his place and stature among his contemporaries. True, no writer of much consequence, no man of much consequence, is wholly explained by contemporaneous tendencies and influences. Only too often, the foremost poet, philosopher, novelist, dramatist, historian of a generation spends his life battling with the theories of his fellows, defying and outraging their standards. Mr. Rhodes, whom most of the critics credit with the best single piece of work in American history that any man of his generation has done, cannot be quite satisfactorily pigeonholed. It would be incorrect to set him down as a thoro and typical representative of the most modern school of workers in history, whose chief characteristics I have just been indicating. It would be glaringly incorrect, on the other hand, to call him a reactionary, a literary historian of the old school. He stands, I should say, between the two schools.

On the whole, however, he has more in common with the new school than with the old. His standards and methods are more like those of the typical German University professor than they are like those of such men as Macaulay and Froude. He has avowed so high an admiration for the late James Rawson Gardiner that I think we may consider Gardiner's history of the period of the Great Civil Wars in England to have been the principal model for Mr. Rhodes's account of the period of our American civil war. The two books are alike in many respects; in thoroness, in the signs of great labor, in candor, in literary form. Neither is commended by any particular grace or charm of style; both are straight-forward, careful, unadorned, serious narratives. They occupy, likewise, similar positions relatively to the historical literatures of their respective countries. It does not seem that the praise Gardiner's work has won is of a nature to establish him among the English men of letters of his time. What he wrote does not seem to be regarded as *belles lettres*. Similarly, widespread as is the commendation of Mr. Rhodes's performance, it does not seem to be regarded as primarily a contribution to literature, nor can Mr. Rhodes be regarded as primarily a man of letters.

Yet on the other hand, as compared with the mass of present-day historians, particularly as compared with the men of the universities, Mr. Rhodes perceptibly leans towards the old literary tradition. He is measurably old-fashioned. Certainly, it was an old-fashioned, a quite distinctly personal, individual enthusiasm for his subject, not a mere scientific, impersonal interest in it, that set him upon his great task and has kept him at it for nineteen years. And what he has written is a history, not a mere series of monographs. A thoroly human quality prevades it all. Nor has it the true academic flavor—so stimulating to a few intellectual appetites, so deadly to others. Scholarly as Mr. Rhodes always is, in so far as scholarliness means thoroness, his manner no more suggests the *savant* than it does the conscious fine writer. His style is more like Grant's, in the "Personal Memoirs," than it is like either—let us say—Bishop Stubbs's or Froude's. It would not be very wide of the mark to say he writes like an American business man of the best type. Critics of a certain sort would probably say he has not "style" at all; and if we should take style to mean only—as it does not, of course—a cultivated quality, an attained manner, a premeditated form, they would be right. But I prefer to say that Mr. Rhodes, thruout his entire work, sticks—and wisely—to his natural style or way of telling things, and that the marked characteristic of this natural style is not eloquence or elegance or sonority or grace,

or anything else that sounds particularly distinguished, but a certain heavy strength.

He is not a master of either the sentence or the paragraph. He has none of the artist's fondness for words, nor his instinct for the right word. He does not even—and this goes rather deep into the psychology of literary effects, I fancy—he does not even let the reader feel that the choice of words is an affair of much moment. I doubt if any half-dozen lines, of all his hundreds of thousands will ever find their way into a volume of choice prose extracts, or even into the school readers. Moreover, his habitual narrative pace is slow, as well as heavy. He does not bring much life and movement into his pages.

Nevertheless, his way of telling things serves its main purpose fairly well. It does not weary, as in the long run brilliancy and cleverness nearly always do. It does not overstrain the attention, as a great wealth of allusion sometimes does—as witness, for instance, Symonds's well known "History of the Renaissance in Italy," from which I happened to turn to Mr. Rhodes's last two volumes. It wears better, in fact, than many a prose style of far greater distinction.

Taking the book in the large, we must decide, I think, that it is not a work of art. Mr. Rhodes had not the imagination to make it that, and it is pretty clear that he did not try; that he did not at all regard himself as an artist. Because this is so, I cannot think that his will prove the "final" history of the most stirring part of all our American past. It is unreasonable to apply that adjective to any history, however true and full, that is not also a masterpiece of imaginative narrative. Should such a masterpiece appear, even tho it should fall short of Mr. Rhodes's standard of accuracy and fullness, it would nevertheless take higher rank as a book than his does; it would have a kind of value which his lacks entirely.

But if we must, accordingly, deny him a place among historians of the first rank—a small company, truly—if he plainly misses the highest excellence possible in history, he as plainly attains the excellence that comes next to the highest; we must admit him to the second rank. Lacking the supreme gift of imagination, he lacks hardly one of the more solid qualities which it is so desirable—and so well-nigh impossible, seemingly—to find in combination with it.

First among the merits of his work I should set simple truthfulness. On the last page of his last volume he quietly declares: "While conscious of my limitations, I have endeavored thruout this history of the great conflict, to which I have devoted nineteen years of my life, to maintain such standards of research and of judgment as should elicit the utmost of truth." And most competent critics, however they may differ with him on specific questions, will, I think, concede that he has been honest and intelligent in the search for truth. What is more, they will concede that he has stuck to the truth as he has found it. Curiously enough, very modest historians will claim to have done that, but I am not sure that any historian finds anything else harder to do. It is particularly difficult when one is writing of events that have come within one's own lifetime. Mr. Rhodes, moreover, is writing of a long, bloody, civil war, and of the reconstruction which followed it—a process that stirred up even more bitterness than the war itself. Yet readers representing both sides seem, as a rule, to find his book truthful, fair. Is there any other account of either period of which so much can be said?

One reason, I think, why in this respect Mr. Rhodes has succeeded so exceptionally is that he is not only truthful and fair-minded, but candid. He wins his readers' confidence so generally because he so freely takes them into his confidence. It were hard to find another historian who supplies so lavishly the means to test his own accuracy; not merely lists of his authorities, but generous quotations from them. Frequently, he is not content with exhibiting his sources, but must show also the steps by which he has come to his conclusions. It is impossible either to accuse him of taking on too much the air of authority or to suspect him of any purpose to deceive.

Truthfulness, fairness, candor—all moral qualities, at bottom—would not, however, suffice to make him the admir-

ably safe guide he is thru this so troubled period of our past if he were not also otherwise exceptionally competent: if he did not understand his country and his countrymen, if his mind were not matured by experience, and by a thoughtful observation of human nature and of life, if, in fine, he did not have the sense to avoid countless easy errors of fact and inference such as the historian of any epoch is always in danger of. He not only traverses evidence with thoroness and patience, not only sifts and weighs it in the right judicial temper, he has also an excellent judicial instinct. The very best part of all his work is the judgments of causes and men. The book is not only just and fair in its general views, it has a cumulative effect of specific rightness. One finds in it remarkably satisfying accounts of all those particular incidents and episodes and characters of its period concerning which controversies have arisen.

I am not sure that "satisfying"—or, better still, since more American, "satisfactory"—would not come nearer than any other word to summing up one's feeling for the book. Within the limits I have tried to indicate it is not easily overpraised. That, however, breeds regret—regret that once more a work so excellent as history should not be also excellent as literary art.

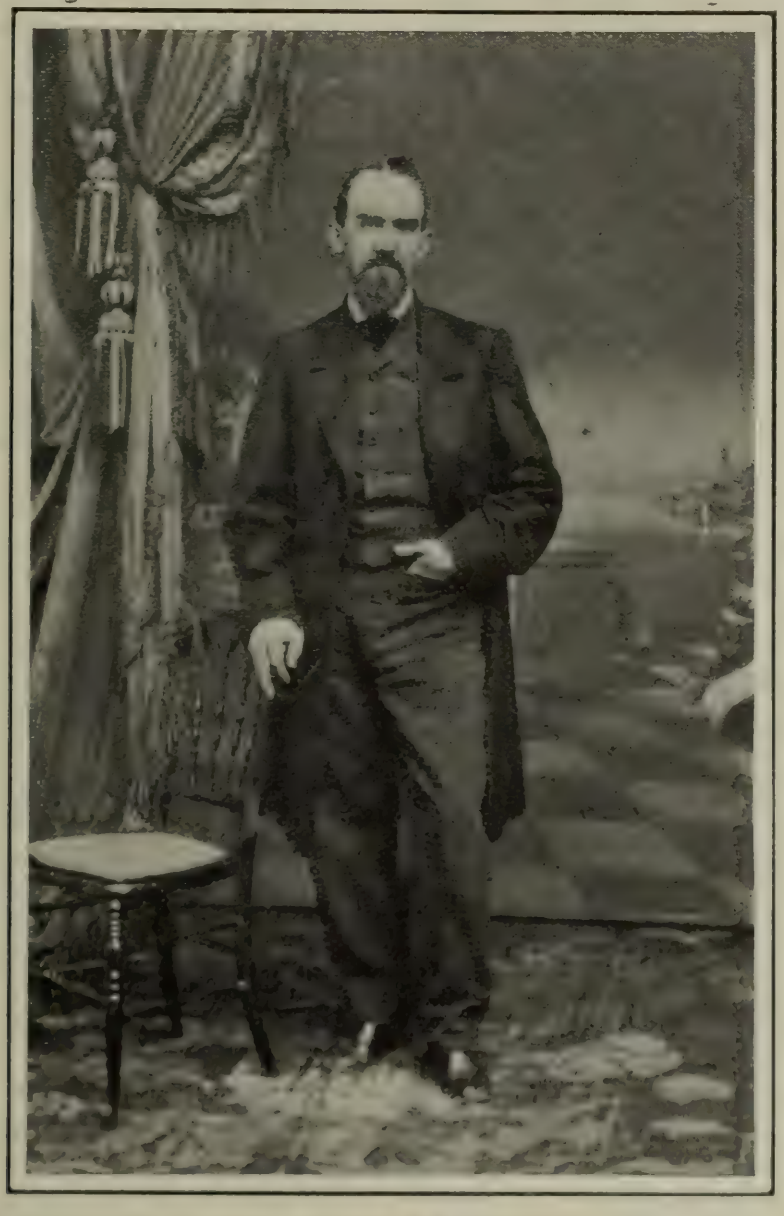
ASHEVILLE, N. C.

How I Captured John Brown

BY JOEL CLARK ROCKWELL

[The following account is taken stenographically from the author's lips, and has never before been given to the public. Its timeliness is apparent in view of the recent celebration in Kansas of the work of the abolitionist hero, John Brown, in connection with what is known as the Border Ruffian War. Mr. Rockwell was born in 1823. He settled early in Weston, Mo. He was the original owner of the quarter section on which the city of Atchison, Kan., is now built; there he erected and owned the first six houses of that city; and from there he did a freighting business, by "prairie schooners," across the plains to Salt Lake City.—EDITOR.]

MOST people have heard "John Brown's Body" sung, but very few have any idea about John Brown. At the time when I took him prisoner, in 1857, feeling ran high in connection with the Border Ruffian War, as it was termed, which concerned itself with the question of the admission of Kansas as a slave State. I was living in Missouri, opposite Kansas, at the time. Missouri, being a slave State, and bounding Kansas on the east, was anxious that it should be a slave State also. But the Civil War settled all that soon after.



About that time John Brown, who had already become a conspicuous anti-slavery agitator in the East, got up a company of young men and came to Kansas and located at Lawrence, on the Kansas River. His followers themselves acknowledged that he was a fanatic, crazy on the subject of slavery, and willing to forfeit his life for the negro. Brown outfitted his young men as agents for selling sewing machines, books, etc., and sent them across into Missouri. They walked around the country and, wherever they found opportunity, told the slaves that, if they would come to the Missouri River at night, some of their party would meet them and get them across into Kansas, where the people of Missouri dared not come. Some welcomed this direction, and were taken over the border.

At that time my partner owned a valuable negro, whom we called "Dick," together with his wife and three children. My partner turned him over to me as so much property, at $2,700. Dick was quite a musician. Their owners always gave the slaves their time at Christmas and New Year's, and they had for their own whatever money they could earn during that season. Dick found that by going to Leavenworth, Kan., he could find a few days' occupation as a musician. I passed him over. But when the holidays had expired he did not return. In three months I found that John Brown had him in his corral

at Lawrence. When he had fifteen or twenty such he would take them by night 300 miles to Council Bluffs, and thence by rail to Chicago and Canada, this route being known as "the underground railway." At this time he had already gotten about one hundred negroes thru to Canada.

One old negro, to whom John Brown's traveling agents had given the countersign, turned traitor, and revealed the secret to his master. Then some of the border ruffians colored their faces and gave the countersign one night at the river crossing; and when the men came over for them they seized them and marched them up a hill on some property belonging to me and hanged them. When I went out the next morning I saw them suspended from a tree.

John Brown always kept back in the dark and did his work thru his men. Dick did not get started very soon, because they did not have enough negroes for the expedition. The postmaster at Weston, Mo., wrote to me that Dick was at Lawrence and was to be taken in a few days to Canada. They were going to start on a certain day, so as to reach a noted spring by a certain time. I got four other men to co-operate with me, one of them John Woods, noted for his fighting qualities, and we planned that when they came to the spring we should take them prisoners, if possible, and at least capture Dick, whose wife and children were about crazy over his long absence. From our place there was a ferry crossing to Fort Leavenworth. We made arrangements with the ferry-

JOEL CLARK ROCKWELL.
(In 1857.)

boat captain to wait and take us back into Missouri that night.

The country was prairie and barren of trees, but around the spring there were bushes where we secreted the horses and ourselves. We had not been long in concealment when we saw three covered wagons, prairie schooners, coming; and these all stopped at the spring. Soon who should appear but Dick, sent down to the spring with two pails, for water.

"That is Dick," I said.

"Are you afraid to speak to him?"

"No," I answered; and then, advancing a little, I said, "Hello, Dick."

"Hello. Mas'r Rockwell."

"Do you want to go back to wife and children," I asked, "or to go with John Brown? You can do as you like," tho I had no idea of letting him go.

"I want to go back home," he answered.

"All right," I said. "Who is up there in those wagons?"

"John Brown and sons, his son-in-law and others, about sixteen men."

"Are they armed?" I inquired.

"John Brown has a pistol," said Dick; "but I think no others are armed."

We got on our horses and rode right up and found John Brown driving one of the wagons. He held up his hands at our demand and gave up his pistol. The rest readily submitted to our show of force, and before 10 P. M. we put John Brown on one of our horses, and, while I rode by his side, drove to the ferry. To our astonishment not one of the slaves tried to get away or made any complaint. As for Brown, all that he seemed to be afraid of was that he would be lynched. Once across the river and in Weston, we found that the crowd had a stake driven and a fire made ready to burn him.

One-half the population were Germans; and they were Union men, whose sentiments somewhat offset those of the rest of the people. John Brown begged hard and said that he was willing to be punished by the law if we would only not let the mob do him violence. We kept a guard over him in the hotel over night. In the morning he wanted to make a speech in the public hall. The news went all around, and men came in from the country for their negroes whom they had lost. I made all agree that not one of the negroes should be abused or punished on being taken back. As for Dick, he cheerfully went back to his family and his work. The multitude gathered in the hall and John Brown made his speech, and at the opening, if you could have let those men loose whose negroes he had kept, they would have devoured him. He had ruined many and many a farmer there, whose only means of support was their negroes and what they earned. It was like running a farm with no horses to try to do the same with no slaves. So when this tall, dark-complexioned, coarse-featured man, looking like a regular old farmer, at last stood before them to begin his address, they would have voted, to a man, to hang him. But when he had finished speaking, and the vote was taken as to whether to take him to St. Jo and leave him in jail till he could be tried by the law, there was not a single vote for lynching.

In Kansas they knew what we were doing all the time. Men went up on the west side of the river as far as St. Jo, and crossed over above the city where we had him in jail. Procuring horses, three of them rode at 11 P. M. to the jail, and having placed handcuffs on the wrists of one of their number, and a second representing himself as sheriff of Holt County, they applied to the jailer for safekeeping for this pretended notorious horse thief. The jailer readily admitted them and was about to lead the way to a cell when to his own wrists the handcuffs were dexterously transferred, and the three men called out, "John Brown!" The abolitionist answered from his cell, whence he was immediately released and hustled over the river into Kansas.

John Brown did not remain in Kansas; but the next that we heard of him was at Harper's Ferry, where he performed his most famous exploit, October 16th, 1859, in capturing the arsenal, for which he was hanged at Charlestown, December 2d following. His body lies on his old farm in the Adirondacks, near Saranac Lake, at North Elba, once the Mecca of the fugitive slave, in those earlier days when the old hero made his brave attempt at founding a negro republic.

Literature

The Cage

THE scene of this story* is laid in the lumber-yard districts of Chicago, and the story itself consists of a number of crucial instances and inevitable energies by which the people there passed from one set of ideals to another. The first vision we have is that of Freda, the minister's daughter, as she sits upon the back porch watching the sunlit roofs, which she thinks cover the vast caldron of life within which God will stir some day with grace and joy and holiness. Yet the story goes on to show the failure of the old minister with his theological dispensations to woful men and women whose powers and principalities of darkness become real in the long working hours, the squalor, and unimaginable miseries of their actual conditions. The substitution of Socialism, with its tremendous hopes of a new Heaven and a new earth, is very deftly done, and shows what an amazing opportunity socialists in general neglect when they fail to enlist the sympathy of the churches in their redemptive processes. Nothing quickens sooner to a sense of the world's misery, or is more easily harnessed than the mind of the average preacher who is at his wits' end for a remedy, and who would take up with any socialist who would leave him God to worship and a few doctrinal essentials of the spiritual life. But that is the trouble. The socialists are also dogmatists, who make too few concessions to an elder faith.

MRS. CHARLOTTE TELLER JOHNSON.
From a photograph by Hollinger.

But now, having introduced the gospel according to Marx, it is only the question of a few chapters, in which the conservative reader's mind is prepared and convinced for what is to come. This is "the strike," which is always the climax in socialistic fiction, and then comes the throwing of the inevitable bomb. After that we have the chaos out of which all socialists evolve their order. Bridals and death scenes come close together, and the reader begins to understand that he has been reading the history of actual occurrences in Chicago. But the book closes with everybody serene, warm, comfortably fed, decently married, and with the boon of shorter working hours.

This, however, is merely the conventional interpretation of Mrs. Johnson's really wonderful story. She has combined the romantic and the economic element in such proportion that each enhances the other. She is, in fact, among the first American writers of fiction to realize that we are not only at the beginning of a new economic movement, but that it is distinctly a romantic movement, and that it is to develop a new sentimentality; just as the Crusades were the tidal waves of a new romanticism in the middle centuries which gave birth to chivalry. The sacrifice is tremendous, but the hopes which survive it are also tremendous. "It

* THE CAGE. *By Charlotte Teller.* New York: D. Appleton & Co. $1.50.

is like a horrible picture," says Freda one day to her lover when she realized the struggle, "men fighting, fighting, and going into the dark." . . . "Not into the dark," he replies. "This is only the dawn of the world, grand and somber, yet with flashes of great light now and then; not enough to show the way, but enough to light the faces of the men who are struggling in this dawn. . . ." That sentence indicates the lift in the book, the change of spiritual scenery from the first horror-haunted stage of this new mind to the clearer vision, which is accompanied by that ecstasy of a life so new that it is still a mere prophecy, but as inevitable as birth after gestation.

And Freda is not the fanatical female agitator who has been for some time the hag heroine of socialistic fiction, but she is the right heroine of the new order. She is slim, pretty, adorable. She has an epic sense of what is transpiring about her, and candle-like power of shedding light upon it—her own light. Then, again, she is like a phrase of fine music. Above all, she is enchantingly feminine, with a new kind of archery fitted better to that life which shall come after "the Cage" has been broken. By "the Cage" the author means the tyranny of the law.

This is Mrs. Johnson's first book, but the unaffected style, the ease and strength with which she has put together the varying phrases of a difficult situation so as to produce a perfect illusion, indicates that she may win high rank among the writers of the new fiction.

Lafcadio Hearn

It would be an interesting speculation to trace the influence of isolation upon style; it is without question favorable to the writing of letters; and we fancy a leisureliness in the compositions of men who live in far away lands, in fact and in spirit isolated from their kind.

We doubt whether Stevenson could have written his letters of wonder and charm in London, and we know that Lafcadio Hearn could not have composed the marvelous series comprised in these two large volumes* if he had remained in New York, among

"things that seemed less buildings than fortifications—astonishments of loftiness and silent power, colossal dreams of stone trying to touch the moon——;" "the moment I get into all this beastly machinery called 'New York' I get caught in some belt and whirled madly in all directions until I have no sense left. This city drives me crazy, or, if you prefer, crazier. One has to live by intuition and move by steam. Now there are cubic miles of cut granite and iron fury between us. I shall at once find a hackman to take me away."

The fourteen years of life in the Far East were rich in literary accomplishment, not only in the production of the greater part of his books, but also, in the second volume of *Letters,* so appealing in their beauty. Hearn seemed to develop a new soul in Japan—"one of his souls" as he would have said in the whimsical fancy he cherished of a many-souled personality, grew sweeter and stronger in that "grey-and-blue" country, which we think of as "Toyland," where even the trees "seem to know what people say about them—seem to have little human souls." He grew out of and away from the purely pagan, Verlaine-Gautier phase of his earlier worship, wherein the Greek "the divinely natural, impulses of man were always the supreme law, and divinely right—*because* natural." The youthful artist, working in any medium, is prone to be impatient of the prejudices of Anglo-Saxon pudency. The beautiful is to him always its own justification for being, and his inexperience makes him unafraid of the nudities of art. Yet many years after, when the boy had himself become the father of a boy, and began to think of his son's future, he said:

"What shall I do with him? Send him to grim Puritans, that he may be taught the way of the Lord? I am beginning to think that really much of the ecclesiastical education (bad and cruel as I used to imagine it) is founded on the best experience of man under civilization, and I understand lots of things I used to think superstitious bosh and now think solid wisdom."

The little son who taught his father so much moral philosophy, is the theme of many letters which show a human and lovable side of the literary artist otherwise so sensitively self-absorbed, and "Yakumo Koizumi," at the head of his feudal, Japanese household, so unselfishly toiling for their support; having no longer "any wants personal," only anxious about his family, especially the little lad so like his sensitive father, is a much nobler, more attractive man than

* The Life and Letters of Lafcadio Hearn. *By Elizabeth Bisland.* Boston: Houghton, Mifflin & Co. $6.00.

Lafcadio Hearn, seeking self-development at any cost to others or to himself, and scornful of the sweet home pieties. His life was so romantic from his birth at Lefcada in the Ionian Isles, to his death in Japan at the early age of fifty-four, that it needs no meretricious art to make it absorbing. Mrs. Bisland tells the story well, with the full understanding given by thirty years of uninterrupted friendship. But it is best told in the letters that compose three-fourths of the work—letters not likely to be excelled, in our day, for personal charm, exquisite phrasing and wide intellectual interests. We think of Stevenson, and we pause—yet not even he wrote better to his intimates, and it is hard to tell how much of his attraction is due to his fine and debonaire courage under circumstances which mean defeat to most of us. Hearn showed courage, too, thru countless discouragements, and a heart-tragedy which the letters hint but never reveal, and some of his finest work is like "Poetry—the crystallization of all human desire after the impossible, the diamond created by prodigious pressure of suffering."

"I do not believe that any one can expect to obtain real success before he is thirty-five or forty. You cannot even forge yourself a good literary style before thirty and even then it will not be perfectly tempered for some years."

"If you like anything I have done, it is because I have taken horrible pains with it. Eight months of work on one sketch, then eight months on another, not yet finished."

But his work, tho no less careful became in time less painfully wrought, and his enforced seclusion from literary people of his own race, in the interior of Japan, threw him back upon his friends afar who were richer by his letters.

Sex and Society

ANY book which purports to probe thru the conventionalities and which has inscribed such a title as *Sex and Society*[1] upon a red cover is sure to create a sensation while the public is in its present nervous state. Professor Thomas's articles began to raise a commotion while they were still appearing in the *American Journal of Sociology*, and he had to stand a simultaneous attack from opposite quarters. Both the woman suffragists and the anti-suffragists took him for an enemy and rivaled each other in the virulence of their criticism. This would lead one to suppose either that the book occupied the safe middle ground or that it was carelessly worded. Both suppositions are true. Professor Thomas does not take an extreme position nor has he promulgated any very novel or startlingly radical theories, but he has not taken enough pains to make his meaning plain and to guard his words from misconstruction. Any sociological statements on the sex question ought to be provided with fenders.

Most of the misconstructions of the theories of Professor Thomas have arisen because he has not distinguished clearly between those feminine peculiarities that are inherited and those due to custom and tradition. He is not to blame for this, for neither he nor any one else in the world knows enough to make such a distinction. We cannot tell what kind of creature "the normal woman" is, still less what she might be, because neither under savagery nor civilization has she had a chance to exist. Professor Thomas's failure to emphasize the extent of our ignorance on this fundamental question has made him liable to the charge of underestimating the abilities and character of women. But probably nothing less than a footnote at the bottom of every page would have protected him from it.

Professor Thomas first considers in detail the organic differences in the sexes, arriving at the conclusion that

"Man is fitted for feats of strength and bursts of energy; woman has more stability and endurance. While woman remains nearer to the infantile type, man approaches more to the senile. The extreme variational tendency of man expresses itself in a larger percentage of genius, insanity and idiocy; woman remains more nearly normal."

He then discusses the origin of social traits and customs as shown in the lower races, the genesis of modesty, the mental and physical differentiation of the sexes, due to diverse employment, and the various forms of marriage, drawing his facts and illustrations from a wide

[1] SEX AND SOCIETY. Studies in the Social Psychology of Sex. By William I. Thomas. Chicago: The University of Chicago Press. $1.50.

range of reading and presenting them in a manner comprehensible and interesting to the general reader. The most important part of the book is that which deals with the survival of the usages of savagery in modern life, such as the double standard of morals, the theory that women should be barred from useful work, the proprietary view of marriage and the practice of chaperonage. We commend the following paragraphs to those colleagues of the author who are attempting to segregate the students in the University of Chicago and thereby deepening the intellectual gulf between the sexes which he deplores:

"The world of white civilization is intellectually rich because it has amassed a rich fund of general ideas, and has organized these into specialized bodies of knowledge, and has also developed a special technique for the presentation of this knowledge and standpoint to the young members of society, and for localizing their attention in special fields of interest. When for any reason a class of society is excluded from this process, as women have been historically, it must necessarily remain ignorant. But, while no one would make any question that women confined as these in New Ireland and China, as shown above, must have an intelligence as restricted as their mode of life, we are apt to lose sight altogether of the fact that chivalry and chaperonage and modern convention are the persistence of the old race habit of contempt for women, and of their intellectual sequestration. Men and women still form two distinct classes and are not in free communication with each other.

"Women may and do protest against the triviality of their lives, but emotional interests are more immediate than intellectual ones, and human nature does not drift into intellectual pursuit voluntarily, but is forced into it in connection with the urgency of practical activities. The women who are obliged to work are of the poorer classes, and have not that leisure and opportunity preliminary to any specialized acquirement; while those who have leisure are supported in that position both by money and by precedent and habit, and have no immediate stimulation to lift them out of it. . . . The general ill-health of girls of the better classes, and the equally general post-matrimonial breakdown, are probably due largely to the fact that the nervous organization demands more normal stimulations and reactions than are supplied. The American woman of the better classes has superior rights and no duties, and yet she is worrying herself to death—not over specific troubles, but because she has lost her connection with reality. Many women, more intelligent and energetic than their husbands and brothers, have no more serious occupations than to play the house-cat, with or without ornament."

Professor Thomas says that "child-bearing is an incident in the life of the normal woman of no more significance . . . than the interruption of the work of men by their indoor and outdoor games." Mrs. Commander has written a book to prove the opposite, that child-bearing has become so severe a tax upon women who desire to maintain a high standard of life that race-suicide is inevitable unless there is a radical readjustment of industrial conditions. It is well that the publishers put a question mark after the title on the cover, for the limitation of families cannot be called *The American Idea*[2], since it has prevailed much longer and more extensively in Europe than in this country. With Mrs. Commander's ideas our readers are somewhat acquainted thru her articles in THE INDEPENDENT. She does not have so much to say about the life of savages as Professor Thomas, but she has inquired persistently and promiscuously into the life of today, particularly into the reasons given by men and women for their disinclination to have large families. She finds that it is among the well-to-do women, who have the most liberty and leisure, who have little housework and no outside employment, that child-bearing is most generally avoided, while laboring women and those in the professions are more willing to have children, notwithstanding the interference with their work.

Two Humorists

MR. BERT LESTON TAYLOR, the robust mocker of the affectations and frauds of the recent boom period of fiction, the inventor of "Bilioustine" and "Book Booster," the laughing castigator of the commercialization of a form of art, has written a novel.[1] It is a serious novel, not a parody like that delicious fragment, "The Stovepipe of Navarre," but none the less is satire again its author's chief aim. Unworthy successes of fiction are forsaken in the tale for the parasites of the world of music. Each autumn brings to the metropolis shoals of trusting students securely caught by

[2] THE AMERICAN IDEA. Does the national tendency toward a small family point to race suicide or race development? *By Lydia Kingsmill Commander.* New York: A. S. Barnes & Co. $1.50.

[1] THE CHARLATANS. *By Bert Leston Taylor.* Indianapolis: The Bobbs-Merrill Co. $1.50.

the golden promises of a class of unscrupulous teachers and directors of conservatories, who, since they must live, purpose to live as well and comfortably as possible. Mr. Taylor attacks a fraud of vast proportions. He amuses his readers, by the way, with clever caricatures of *poseurs,* professional and amateur, of pretenders of drawing-room and concert hall, with sounding of the hollowness of make-believe that underlies so much gushing enthusiasm for all the arts, so much ostentatious cultivation of culture.

Thus far the purpose and the satire. What about the vehicle, the story itself? Truth to tell, Mr. Taylor does not reveal himself as a born novelist, nor can it be said that his first effort betrays a serious preliminary training of his pen for its exacting new employment. As fiction the book stands on a par with many of the stories its author has satirized so freely in the past. It is wofully lacking in literary distinction, and even in literary promise.

Racy of the soil, always close to common American humanity, whether it be inland, along shore, afloat, or *in partibus,* Mr. Arthur Colton, on the other hand, is as felicitous and finished in his manner as he is in the selection and arrangement of his material. He knows how to conceal his art, how to efface himself; he freely allows his characters to speak for themselves, in their own peculiar way, according to their own individuality, with utter unconsciousness of a larger and possibly critical audience beyond the pages of the book; best of all, his humor is always spontaneous, never applied from without, in his own person, ever an integral part of the situation and of the processes of ratiocination of its protagonists. A born story teller, he is not forgetful of the results of taking infinite pains. He has been called the "American Jacobs," but his talent ranges far wider, and he never repeats himself as the English humorist is apt to do. Whoever listened to Captain Buckingham's yarns of his adventures on "The Belted Seas," and took notice of the lifelike kitkats of his company of listeners, will rejoice as heartily, but in a different manner, over the group which circumstance brought together in the course of *The Cruise of the Violetta.*[2]

The World Machine. The First Phase: The Cosmic Mechanism. By Carl Snyder. New York: Longmans, Green & Co. $2.50.

Nothing in Mr. Snyder's previous work has led us to expect so good a book as this is. His "New Conceptions of Science" was carelessly written; full of errors and of rash, extravagant statements. He has not altogether broken himself of the habit of indulging in dogmatic generalizations and startling metaphors, but he has in this volume achieved a real success in a difficult field. No one, except one who has tried to do it, knows how hard it is to make the significance and importance of a scientific discovery comprehensible to the layman, and to make it also interesting and dramatic, as Mr. Snyder does, is a greater triumph still. He traces the history of the development of our ideas of the physical universe from Aristarchus to Arrhenius in graphic sentences, grouping each advance in thought about a particular individual, and giving human interest to his narrative by interweaving picturesque bits of biographical detail, so that we feel that we are acquainted with these great benefactors of the human race. This method is, of course, the same that has been often successfully employed in histories of literature and art, but historians of science have been too apt to ignore personalities as unworthy of mention, and to confine themselves to describing the development of abstract ideas as tho they grew spontaneously, like a plant. This impersonal style of historical writing is certainly less interesting than the semi-biographical method, and the latter also gives a truer idea of how science really progresses, of how it is accelerated and retarded and deflected by the idiosyncrasies of its leaders. Even scientific men by profession are apt to have very vague ideas of the personality of their predecessors. Their names are merely adjectives attached to some law or piece of apparatus. But in reading these pages we know them as real people and are the more interested in their work. The only books like this

[2] The Cruise of the Violetta. By Arthur Colton. New York: Henry Holt & Co. $1.50.

are Draper's "Intellectual Development of Europe" and White's "Warfare of Science," but the first of these is now antiquated and the second is too polemical. It is a useful book for the public library, because it gives to the general reader more information on the history of science than he can find anywhere else in a readable form. We would especially commend Mr. Snyder for steering skillfully between the two opposite temptations that beset the writer of a history of

HALF-GROWN LITTLE GREEN HERONS ON DRESS PARADE.
From Blanchan's "Birds Every Child Should Know." Doubleday, Page.

science, that of exaggerating the chance element in discoveries, and that of representing them as due at a certain date and always coming in on time like an express train.

Birds that Every Child Should Know. The East. By Neltje Blanchan. New York: Doubleday, Page & Co. $1.20.

If "every child" knew all that, in the opinion of his teachers, he "should know," he would be as wise as Macaulay's schoolboy. Not only children, but most of their elders, can learn something to their advantage about the bird life of the eastern part of the United States from this book. Nearly a hundred species are described and talked about in an informal, interesting way, technicalities being avoided as much as possible, perhaps too much for convenience of identification. The author, Mrs. Doubleday, occasionally "talks down" to her readers in a way that a child who has got beyond the Mother Goose stage and is proud of it would be apt to resent. The best feature of the volume is the series of sixty-three pages of photographs of wild birds, mostly nestlings, all skilfully taken and admirably printed.

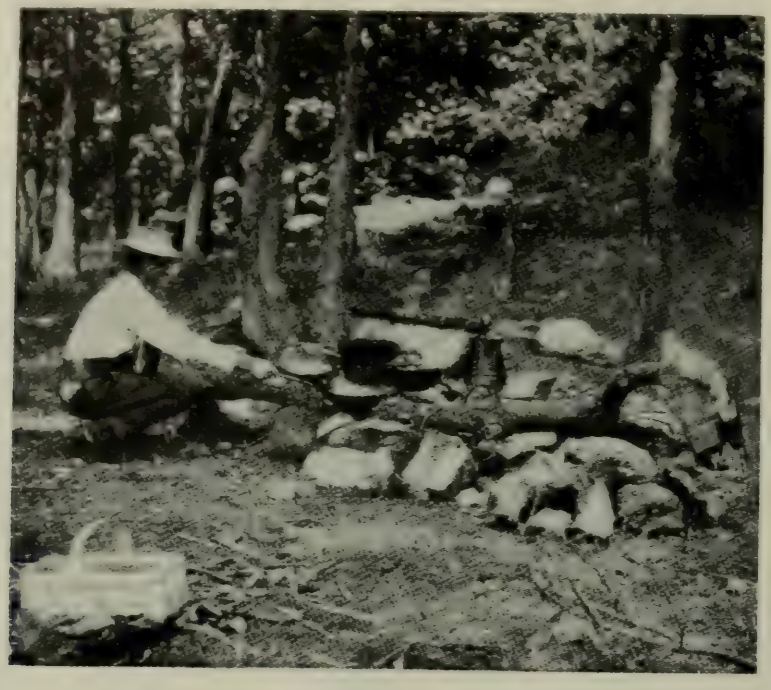
The Philosophy of Religion. By Dr. Harald Höffding. Translated from the German edition by B. E. Meyer. New York: The MacMillan Co. $3.00.

Professor Höffding, of the University of Copenhagen, is one of the ablest and most distinguished of living European writers on philosophical and religious subjects. His works on psychology and ethics and his occasional writings on metaphysical topics have secured him a reputation for a thoro grasp of philosophical problems and skillful literary presentation. His *Philosophy of Religion* is a work of high value. The first section, entitled epistemological, treats of the relation of faith to knowledge, the distinction between understanding in the

scientific sense and religious estimation. Attention to the considerations here brought forward would save many a religious writer from confusion and inconclusiveness. The second section, on the psychology of religion, is devoted largely to the author's principal thesis, that the essense of religion is faith in the principle of the conservation of values. Professor Höffding builds upon the Kantian distinction between judgments of value and judgments of knowledge, and he finds the realm of religion in the former sphere, and particularly in the sense that values must be preserved. This is an original and suggestive account of the significance of the religious sentiment. It is the equivalent in philosophical form of Browning's exultant faith:

"There shall never be one lost good!"

That this is the real meaning of all religions, of crude polytheisms as well as such widely differing systems as Buddhism and Christianity, is difficult to realize and still more difficult to prove, but Professor Höffding's endeavor to establish it is worthy of careful consideration. Knowledge of recent philosophical discussions on the part of the reader is presupposed. The point of view is that of the student of modern philosophy, not that of the practical apologist. The author conceives the problem of the philosophy of religion to be to describe and analyze faith, not to justify belief nor to defend a particular creed. He has none of the enthusiasm for his notion of religion which has given Schleiermacher's celebrated definition its remarkable influence for the past hundred years. Yet his underlying thought is the same—that religion is a real and necessary element of the life of man, and that it is possible to describe it in such manner that it will be seen to be indispensable to human development. Apart from the main argument of the book there are many criticisms and suggestions of real insight and power. Mr. Meyer's translation is a faithful piece of work.



Richard Elliott, Financier. By George Carling. Boston: L. C. Page & Co. $1.50.

It is curious to observe how old conditions will survive under new guises. Hardly had the historical novel been laid aside for a generation or two than we turned to the later fashion, the literature of "graft." This is the day of the story of frenzied finance, of dishonest ways of growing rich, of the love that is the root of all evil. No masterpiece of this new fiction has yet been produced—hardly as yet a formidable "best-seller." These tales are all notably lacking in literary quality; one calls them novels merely by courtesy. Our hurried young writers of this class of reading matter, making hay while the sun shines, have produced nothing thus far worthy to be placed by the side of such early specimens of the *genre* as "Dombey & Son" or "Fromont Jeune et Risler Aîné," nothing, even, to compare with Charles Dudley Warner's "Little Journey in the World," or Harold Frederic's "Market Place," or Norris's "Octopus." Mr. George Carling adds another tale to the list, and it is a sordid one, but perfunctorily relieved by a touch of easy sentiment. Wealth is its theme, and wealth acquired by the easiest dishonest methods. The grasping hero outwits the great Standard Wool Company, is punished by it, resumes the battle, and so on, till melodramatic retribution ends the record. The only feature of the book that carries conviction to the reader is its exposition of the tricks of "graft." There is a certain unwholesome fascination in these details of the ways of dishonesty on a gigantic scale.

Correspondence of Two Brothers: Edward Adolphus, Eleventh Duke of Somerset, and His Brother, Lord Webb Seymour, 1800 to 1819 and After. By Lady Gwendolen Ramsden, with portraits and other illustrations. New York: Longmans, Green & Co. $4.00.

This is one of those records of cultured English life welcomed by readers of, for example, the Hare biographies. The Seymours were prominent in a social circle made up of some of the finer spirits of the time, earnest, scholarly men who contributed to political and scientific progress. Hallam, Mackintosh, Playfair, Davy, and—chief among them—Francis Horner, whose early death was one of England's greatest losses in the period when the interests of the people were beginning to be recognized as of paramount importance. The intimate correspondence here found on the con-

cerns of such men is valuable not only for the facts and contemporary views given, but for the characters revealed by it. The Duke of Somerset, tho not a supreme man in any sense, was an active appreciator of the needs of popular education and a supporter of Sir Robert Peel. Lord Webb Seymour, a man of leisure, used that leisure in study and travel, and his journals, of which the volume contains much, are charming in their appreciation of nature, and their independent and modest judgments of art and literature as well as of men.

AN IDEAL CAMPFIRE.
From Kephart's "Book of Camping and Woodcraft." Outing Co.

The Book of Camping and Woodcraft. By Horace Kephart. New York: The Outing Publishing Co. $1.50.

Here is a complete guide to the art of camping in comfort. Mr. Kephart buttonholes you gently, fixes you with his woodman's eye, and if you can escape the longing to start for the wilderness at the first vacation moment you must be an unusual man. For he tells just what to wear and to carry with you, just where to pitch your tent and how, and he sings the joys of the forest trail in a hearty voice, full of invitation and manly cheer. If game is scarce, the author is ready with a long list of edible pot herbs and salads, nuts and fruits, occupying twenty pages or so of the book; there are minute and practical directions how to dress game and fish, what to do in case of accident—in short, the claim of the title page that this is a complete "guide to those who travel in the wilderness" is thoroly substantiated by the text. If you contemplate a camping trip next summer this is a good time to study up and get your kit ready.

A Dictionary of Christ and the Gospels. Edited by James Hastings, D. D., with the assistance of John A. Selbie, D. D., and (in the reading of the proofs) of John C. Lambert, D. D. Vol. 1, Aaron—Knowledge. Large 8vo, pp. xii,. 936 Charles Scribner's Sons. Sold only by subscription. $6.00.

Dr. Hastings is not easily satisfied. First he issued his four-volume "Dictionary of the Bible," and scarcely was it issued when he added a fifth volume to fill its gaps. And now he announces an equally bulky *Dictionary of Christ and the Gospels* in two volumes, of which the first is at hand. The authors of the articles are both English and American, with a few Germans. Among the Americans we count Professor Bacon, of Yale ("Aristion"); Gilbert, lately of Chicago Theological Seminary ("God"); Professor Zenos, of McCormick Seminary ("Apocalyptic Literature"); Professor McPheeters, of Columbia, S. C. ("Authority in Religion"); Professor Vos, of Princeton ("Covenant"); Prof. Shailer Mathews, of Chicago University ("Day of Judgment"); Professor Terry, of Northwestern University ("Eternal

Life"); Prof. F. H. Foster, lately of Pacific Seminary, later of Olivet, Mich. ("Humanity of Christ"); and Professor Kilpatrick, of Toronto ("Incarnation"). Other authors are Professors Alexander, of Vanderbilt University; Armstrong, Hodge and Warfield, of Princeton; Beattie and Dosker, of the Presbyterian Seminary of Kentucky; Dorgan, Eager and Sampey, of the Baptist Seminary at Louisville; Denio, of Bangor; Principal Falconer, of the Presbyterian College at Halifax, N. S.; Professors Farmer, of McMaster University, Toronto; Gates, of Andover; Goodspeed and Newman, of Baylor University, Waco, Tex.; President Moore, Presbyterian Seminary, Richmond, Va.; Principal Patrick, of Manitoba College; Professors Riggs, of Auburn; Robinson, of McCormick Seminary; Sheldon, of Boston University; Stewart, of Lincoln University, Penn.; and President Wood, of Newton Seminary. If there be one of these who may be regarded as somewhat advanced in theology, he has no chance to show it in the article assigned to him. For any more advanced articles we must look to English writers, like Marcus Dods, who writes on "Inspiration." The *Dictionary*, which is full of all sorts of articles that can be attached in any way to Christ and the Gospels, is learned and decidedly conservative, and is adapted for both the exegetic and homiletic use of the preacher.

Literary Notes

....Mr. Robert Grier Cook last week gave an exhibition at his offices in New York of the Caruso caricatures and the plates illustrating the catalog of the J. P. Morgan collection of Chinese porcelains, which he has published.

....The daily Greek newspaper of New York, *The Atlantis*, has published a very good modern Greek-English and English-Greek dictionary, complete in one volume. It attempts something more than the usual pocket edition. The price is $2.

....Those of our readers who have written to inquire where they could learn something more about pragmatism will be glad to learn that Professor James's lectures on that subject are being published in the *Popular Science Monthly*, beginning with the March number.

....A new edition of *Ridpath's Library of Universal Literature* has been issued. This work has been so long before the public that no review of it is necessary. In its 25 volumes of moderate size it gives brief biographical sketches of more than 2,300 authors of all ages and languages, with short extracts from their works.

....Two hundred and seventy-six illustrations in two hundred and seventy-six pages appear to be the justification for a reprint of *Thackeray's Ballads and Songs*, brought out by J. P. Putnam's Sons at $1.50. The drawings are by H. M. Brock and catch the eye by being in the manner of Hugh Thompson. In make-up the book lacks distinction, and seems, moreover, peculiarly out of the harmony with the subject matter.

....*A Boy's Experience Abroad* is the narrative of the European travels of a youthful author, C. F. King, Jr. "My father told me that if I would be good at school and catch up in my studies, and also if my brother, Cabaniss, was good and caught up in his studies, and I would agree to write a complete diary about my trip, he would take me with him on his vacation to Europe. And so this is the result." The book is very well illustrated and is as interesting as could be expected under the circumstances. (C. M. Clark Co., Boston, $1.50.)

....The peculiar individuality of Coventry Patmore's verse will always limit his circle of admirers. Nevertheless, it is fitting that there should be a definitive edition of his poetical work, and nothing could be in better taste than the volume *Poems*. (New York: The Macmillan Co. $1.75.) An introduction by Basil Champneys gives a brief sketch of the poet, and, what is more to the point, a delicate and illuminating estimate of his poems. In his youth Patmore was praised by Thackeray; he and Tennyson were at one time warm friends, tho afterward estranged; and he numbered among his intimates Carlyle, Ruskin, Browning and men of similar distinction. Of himself he says: "I have written little, but it is all my best. I have never spoken when I had nothing to say, nor spared time or labor to make my words true. I have respected posterity; and, should there be a posterity which cares for letters, I dare to hope that it will respect me."

....The Virginia Company, which established and maintained the first permanent English settlement in America, has left but few of its records for the historian of today. When it was overturned in 1624 King James suppressed its papers as well as its privileges. A copy of its *Court Book*, which escaped the confiscation, and is now in the Library of Congress, has been printed in full by the Library. Since only extracts from the book have been printed hitherto, the appearance of the volume in this Jamestown Memorial year is eminently suitable. It forms two volumes of over 1,300 pages, large quarto, printed on Old Stratford paper, with special type for special characters, and some facsimiles. It is preceded by an historical and bibliographical introduction of over 200 pages by Miss Susan M. Kingsbury, A. M., Ph. D., the editor, and a preface by Prof. Herbert L. Osgood, of Columbia, under whose general advice the material was prepared for publication. It is a very handsome piece of book-making, and is sold for $4, post free.

Editorials

Doing the People

A RAILROAD official the other day published a plea for "justice to the railroads." The comment of an up-State Reuben was concise and unequivocal, notwithstanding its grammatical form: "They don't deserve no justice, and they ain't a-goin' to get none!"

It is pretty generally acknowledged that the railroad corporations and the people are not just now on the best of terms. There is a popular impression that the railroads are retaliating upon the people for their State and Federal legislation, and for certain exemplary punishments, like those inflicted by Judge Holt upon the New York Central. Quite possibly there is some retaliation going on, but we do not imagine that it is the immediate cause of all the horrible railway accidents from day to day reported. The notion that railway directors sit up nights to plan out the details of such massacres as that on the Harlem line the other night, we imagine, is somewhat exaggerated.

However, the neglect of roadbed and rolling stock and the overworking of employees may accomplish a good deal in the way of homicide and other destruction which is not specifically planned, and that this form of retaliation is being tried there is some reason to suspect.

Not only so, but in certain particular ways the railway officials, by their own admission, are trying to make the public "tired' of "meddling legislation." The Pennsylvania and the New York Central lines are in so many words threatening to make the running time from New York to Chicago for all trains twenty-eight hours, if Illinois follows the example of Ohio and Indiana in two-cents-a-mile legislation. They say that fast trains can't be maintained except on an extra fare basis.

This threat will undoubtedly influence a large class of voters who do not ride on palatial trains, as well as the rich people who do. The average voter is quite as much swayed by what he dreams of doing some day or other as by what he does or has once done. Stock gambling is kept going by the fools who have never yet made fortunes in that way, but who confidently expect to make them pretty soon. The unscrupulous use of "the rights of property" is made possible by the millions who are less concerned that they are now impoverished by the trust magnate and the grafter than they would be by the certainty that they could no longer hope to become grafters and magnates themselves. So many a rural legislator will think twice before he votes to lay off the eighteen-hour train that he or his "wimmin folks" might some day take a ride on.

Nevertheless, the general welfare will be promoted if Congress and the State legislators go right on with their contemplated legislation. It would be a good thing for everybody if, for a term of years, the more than luxuriously equipped fast trains should be dropped out of service. There would be an opportunity then to improve the quality of the service which the common herd has to put up with. It is to be feared that the average railroad traveler has not taken the trouble to make such comparisons as he ought to make between the trains that he has to depend on and those that more highly favored individuals enjoy. He rides in cars that are shaky, flat-wheeled, malodorous, filthy with bacteria, indecent in their sleeping accommodations, poorly provided with dining car service, and habitually behind time—all that the resources of the roads may be concentrated upon speed and luxury for the millionaires.

A detailed comparison of these points would reveal the untruthfulness of most of the statements about the alleged superiority of American railway service under private management to the German service under state management. It is true that the luxurious fast trains in America are in most respects superior to the best German trains. On the other hand, the second and third-class service in Germany is immeasurably superior to the service that a majority of Americans are acquainted with.

The simple truth in the whole complicated story of the American railroad business is that discrimination has been

carried to the point at which the public balks. In both the freight and the passenger service the people in general have been "done," cleverly and comprehensively, in the interest of a small and powerful privileged class. The railroad officials are now assuming that by the method of retaliation against legislation and control they can keep on in their good old trade of "doing" the general public. We sincerely hope that the public will take them at their word, enforce reasonable rates and equality of treatment, stand by a while, and see what will happen.

Separation in Great Britain

It is no meaningless warning that the House of Commons has given to the Established Church of England in a definite vote in favor of disestablishment. It is true that this was no bill to create an act of disestablishment, merely a resolution of principles, and not a Cabinet proposal, but offered by a private member. Yet it is startling and most hopeful to see that the Prime Minister voted for it, and that it carried the House. And be it remembered that this means that not a few Liberals who are members of the Church of England must have voted for it. Not for some thirty years has a direct vote on the subject come before the House, and then it was overwhelmingly defeated.

Public sentiment has developed in a generation. Within this time the Church has been disestablished in Ireland, by the courage of that good churchman, Gladstone; and by this time everybody sees and knows that it is as indecent to give ecclesiastical favor to a small minority in Wales as it was in Ireland. Even in England half the people are Nonconformists.

Besides, there is a rapid growth in favor of disestablishment in the Church of England itself, and especially in the Ritualistic ranks of the clergy. A sense of the authority of the Church which is of the essence of High Churchism as well as of Ritualism, must act against the Erastianism which sets the State over the Church. There is no Catholic nation in the world in which the State has such supreme power over the Church as is the case in England. In France, under the Concordat, Napoleon could only nominate the bishops and the Pope had the power of accepting or refusing them, and then the Pope instituted them. In France Napoleon had no right of judgment in an ecclesiastical trial. But in England the King, or his Prime Minister, who may be a Dissenter or a Free-thinker, appoints the bishops; and when a case arises of Church rights or Church faith, the House of Lords, whoever the members may be, have the final decision. It is a most illogical and unchristian condition of things by which the Church is ruled by persons who may have no interest and no faith in it. Think of John Morley in solemn conclave with the Cabinet and advising King Edward who should be Primate of England, and whether candles and incense shall be used in worship; and yet such a case might occur.

France has settled the difficulty logically, for France is logical. It declares for the absolute separation of Church and State. England will not do it in this Parliament or the next, for England is patient and not logical. This Parliament, the best for a generation, will dissolve in a year or two, and will be replaced by another Parliament of a different political faith. This Parliament is too good for the people to hold to. Already the by-elections are going conservative, and the election last Saturday in London shows an extraordinary reversal of public opinion. A bill to abolish the State Church in Wales may carry the Commons, to be again defeated by the Lords. The proposal to restrict the authority of the Lords is essentially just, but justice is slow-footed, so that we must probably wait for ten years longer, until the next Conservative Parliament is replaced by another Liberal one. We cannot sufficiently thank the wisdom of our fathers who insisted that there should be no union of Church and State in this country.

The Harriman Inquiry

After testifying before the Commission in New York, Mr. Harriman went to Washington for recreation. There he expressed for publication some of his opinions about railways, fair play, President Roosevelt and the disagreeable atti-

tude of unsuccessful men toward those who have accomplished something. Of Mr. Roosevelt, who had received him and his little son courteously at the White House, he was kind enough to say: "He means well, but he does not know how." It was unfortunate, he remarked, that the President had not subjected himself "to more discipline" and been trained in business affairs. "He could do great things if he only had more fixity of purpose." Turning to "the reform agitation" which had driven him to the witness stand, he deplored "the tendency of unsuccessful men to assail those who are successful."

Those who are curious to learn what the president of the Union Pacific, the Southern Pacific and other railway companies means by success, and what he has accomplished by fixity of purpose, have only to read the record of his recent testimony, and of the evidence submitted in connection with it. There is no more shameful chapter in the history of American railway finance. The whole country has been shocked by it. Following the life insurance scandals, and in some degree related to them, the railway buccaneering of Mr. Harriman and his allies has seemed, to the honest people of the United States, an additional and intolerable disgrace. But the chief offender, regarding his career as an example of that "success" which excites the hatred of the envious, compares his own wisdom with the undisciplined ignorance of the President of the United States, and mourns as he thinks how great a pirate was lost when Theodore Roosevelt was trained in the ways of honest men.

Owing to what he calls "the unfair methods of the Administration, as carried out by the Interstate Commerce Commission," Mr. Harriman says, "there is now no incentive for a man to be successful." But he is "sure that in the end the old American spirit of fair play will prevail." We are confident that it will, but nothing could be more annoying and discouraging to Mr. Harriman and his kind. Fair play! Were any traces of it perceptible in the looting of the Chicago & Alton, in the 30 per cent. dividend to the Harriman syndicate, in the sales of the syndicate's bonds to the life insurance companies, in the withholding of Southern Pacific earnings reports, in the Union Pacific dividend incident of last August, or in the sales of millions' worth of stock to the Union Pacific by its own directors?

Some weeks ago we set forth the history of the sale of nearly $50,000,000 worth of Illinois Central stock to the Union Pacific, and the record of the August dividend incident, so far as it could then be obtained. Mr. Harriman has since refused to testify as to the missing parts of that record. Why? Are they to his discredit? Is he ashamed of them? Do they not indicate the discipline of his mind and his fixity of purpose? But those were only two in a long series of similar incidents of which now, thanks to the Commission, the public has knowledge. Mr. Harriman should understand that his refusal to disclose the character and extent of his personal interest in those transactions tends inevitably to confirm those suspicions which are most discreditable to him, as the company's controlling officer.

That he has been its controlling officer is shown by the undisputed record, and especially by such action of the company's board as the passage of the resolution of July 26, 1906. And this leads us to a consideration of the responsibility of the directors. A few of these were intimately associated with him in official and other transactions. It is not surprising that he should have had their support. It could not be expected that Mr. Rockefeller, Mr. Rogers and Mr. Stillman would oppose him. Two of them had joined him in the sale of a great quantity of Illinois Central stock to the company. But how did it come about that all the other members of the board, together with the Southern Pacific directors, gave their approval to his acts and granted to him extraordinary power?

Their names appear in the record of the meeting of August 15. Have Messrs. Charles A. Peabody, Henry C. Frick, R. S. Lovett, A. J. Earling and R. W. Goelet nothing to say now as to all that has been done with the approval of the Union Pacific board? They were present at that meeting (to which we refer mainly because the record of it is accessible), with Messrs. Harriman, William G. Rockefeller, H. H. Rogers and James

Stillman. The absent directors were Messrs. P. A. Valentine, David Willcox, Marvin Hughitt, W. D. Cornish, Oliver Ames and J. F. Smith. Have these gentlemen also been in full accord with Mr. Harriman? Has his exercise of power been satisfactory to them? Was their support given to him with respect to all the transactions that are now exciting so much public interest? If not, it is time for them to say so.

What is to be the effect of the investigation? Undoubtedly there will be a demand for legislation more stringent than the new Rate law. We are speaking only of the financial operations and not of the evidence concerning the elimination of railway competition west of the Mississippi and south of the Hill roads. A majority of the people will insist upon the enactment of laws to prevent, if possible, such transactions. When railway men shall complain of such legislation they will justly be reminded that it is the fruit of the offenses of our greatest association or combination of railroad lines. If it shall appear that relief cannot be obtained by legislative regulation, then the railways will be confronted by a popular demand for Government ownership, to which they will be forced to submit.

Why Stevens Quit

ALTHO we are obliged to confess that the resignation of John S. Stevens as Chief Engineer of the Panama Canal, after eighteen months' service, is as much of a surprise to us as it is to any one, yet we cannot resist the temptation of recalling the fact that we foretold his downfall a year ago. We had "the highest authority," as the Washington correspondents always say, for this prophecy. The said authority in this case was nothing less than the Holy Scripture, and the proof text is to be found in the twenty-sixth verse of the sixth chapter of Luke, and reads as follows: "Woe unto you when all men shall speak well of you." Surely, if that verse ever fitted any man it was Mr. Stevens. High and low, Panama and Washington, silver men and gold men, all joined at that time in a chorus of praise, the only differences being in the vocabulary used to express it. He was foreordained to bring order out of chaos; he was the right man in the right place; he was Johnny-on-the-spot, the spot being wherever he was most needed at the moment; he was no quitter; he was going to fight it out on this line if it took all summer.

And now, just when the bothersome details of preparation and organization had been cleared away, when the vast machine which he had set up, was ready to be put in motion, and when he was about to be made the head of the Commission, and practically autocrat of the Isthmus, he quits. At first we were puzzled to know why, and being unwilling to suffer the humiliation of being the only periodical which was not able to explain the psychology of Mr. Stevens to its readers, we diligently searched the columns of our contemporaries, so we can now give what seems to be a tolerably complete summary of the reasons for his actions. Mr. Stevens resigned because he discovered that the foundations of the Gatun dam were unsafe; because he found that the construction of the canal would injure the transcontinental railroads; because Mrs. Stevens wanted him to come home; because Chinese were or were not going to be employed; because his books became covered with a thick green mold; because the Senators found fault with him; because he was not getting enough glory; because he did not like Oliver, who is not going to get the contract anyway; because the Panama Canal is not a big enough job to occupy his talents; because the President dictated to him; because he dictated to the President; because he did not approve of the form of contract, which he drew up himself; because he wouldn't work under army officers; because other people got more money; because his health was poor; because he could not play golf on the Isthmus, this being so narrow that a slicing shot is apt to lose a ball in the Atlantic or Pacific hazard; because he was offered another job; because he was crazy. Taken altogether, these certainly constitute a sufficient reason. Far be it from us to discriminate between the opinions of our esteemed contemporaries, and may an equal distance be placed between us and the temptation to add any of our own to the list. All that Mr. Stevens himself

has said is that the President knows why he resigned and can tell if he wants to. No tear is discernible in the presidential eye and Mr. Taft administers no reproof. The Secretary seems, in fact, to have exhausted his powers of admonition on Wallace. Dauchy, Shonts, Stevens and a lot of valuable men of lesser distinction have been allowed to slip out of the harness without a word of remonstrance.

Now we are to have a regime of army engineers, men who have to go where they are ordered and who cannot resign. The voluntary system never has worked well in the tropics. That is why slave labor or its modern equivalent, contract labor, has been often regarded as indispensable in great undertakings. We have been carrying on the canal campaign for only three years, and already have to draft our engineers. It was in Panama, or some country near there, that a Governor sent this memorable answer to the President who had issued a requisition on his province for more troops to defend the liberties of the nation: "I am sending you according to order ten more volunteers. Please return the rope." We call the attention of the Canal Commission to the admirable economy implied in this request.

We have confidence that the army men will do their duty in this new and difficult field as they have elsewhere. Certainly the sanitary department which has been under military management has not been inferior to the construction department, which has been hitherto under civilian control. An army officer is used to having things said about him in the papers without talking back. Mr. Stevens, however, could not have been affected by the published criticism of Isthmian affairs, because he told us that he never read any newspaper or magazine articles on Panama unless he was ordered to by the Government.

The unfortunate thing about swapping horses while we are crossing the Isthmus is the delay. Two years was the time allowed for the preparatory period. By May 4th next we will have spent three years in preliminaries, and Major Goethals, the new Chief Engineer, is to have six months if necessary to look over the ground and decide on his plans of work. If he decides then that part of the work can be best done by contract, another postponement will be necessary. In the meantime, of course, the digging of the Culebra Cut can go on, but the real crux of the canal, as now planned, is not the cut, but the great dirt dam at Gatun, with its double staircase of locks. If work were to begin on this now, it is not likely that it would be completed by the time the rest of the canal is dug. Yet this is the part which is most likely to be done by contractors, because it requires more specialized skill than dredging or digging in the canal prism. We have made a good deal of fun of the Frenchmen. Perhaps we will wish we had not when we observe that we have done less work and spent more money than the De Lesseps Company did in their first three years, notwithstanding that we have ninety-five ton steam shovels where they had pickaxes and spades.

Consumption: Its Origin and Prevention

We publish this week an article by Prof. E. von Behring, of the University of Marburg, Germany, in which he advances what cannot but seem to most people unfamiliar with recent medical literature some rather new and startling ideas with regard to the epidemic reign of that most serious scourge of humanity—consumption. It has commonly been considered that our knowledge of the causation of this disease was rather exhaustive, especially since the detailed studies of it which have followed the discovery of the tubercle bacillus by Professor Koch. As Professor Behring is one of the most distinguished bacteriologists and as his discovery of diphtheria antitoxin has stamped him as a practical inventive genius of great capacity, his ideas must be given an attentive hearing. This is all the more necessary, because in recent years Behring's time has been almost exclusively devoted to the study of tuberculosis, and he has succeeded in accomplishing some excellent work of the most informing character. Any-

thing that he says in the matter receives the immediate attention of his colleagues thruout the world, tho, like the expression of any other medical scientist, no matter how distinguished, it needs to pass thru the fires of criticism to be cleansed of personal dross before reaching general acceptance.

Koch's and Behring's ideas as to the source of most cases of tuberculosis are almost diametrically opposed. Koch considers, as indeed do most of the authorities in tuberculosis, and it is supposed to be a commonplace in etiology, that pulmonary consumption in human beings is caused by breathing in, in contaminated air, tubercle bacilli, which find lodgment in the lungs and set up an active disease process there. Behring asserts that consumption is very rarely acquired in this manner. Most people, according to him, have acquired the disease in early childhood thru contaminated milk, and tho it remains latent for many years, it eventually develops a virulence which causes it to spread in the tissues, and thus may make the local affection a fatal infection. The bacilli that find their way into the human system thru the milk are absorbed by the intestines and carried to the lungs thru the blood and the lymph. Behring even insists that when consumption, as in rare cases he admits it is, is acquired thru the air, it is because the bacilli which gain entrance thru the mouth or nostrils are swallowed with the food and then are carried once more from the digestive tract thru the blood and lymph to the pulmonary tissues.

The most striking difference between the two German authorities in their views as to the causation of tuberculosis of the lungs is that Koch regards infection in adult life as the most important factor for the development of pulmonary consumption, while Behring asserts and maintains that the decisive tuberculosis infections occur in childhood. He reiterates emphatically his opinion that "babies' milk is the principal source of consumption, and that consumption is the last verse of the song which is first sung to the suckling in infancy." It has long been well known that infants were very liable to contract consumption if they were allowed in rooms inhabited by consumptives. This was more true in the past than it is in the present. Every time a consumptive coughs a certain number of germs are scattered over an area of from three to five feet in his immediate neighborhood unless the precaution is taken of applying a handkerchief to the mouth. These germs may be demonstrated by exposing culture media in shallow dishes within a short radius of the coughing consumptive. Such germs as find their way to the floor are likely to be picked up by children in creeping, and when they became dried are disturbed by every one who moves in the room, tho usually they do not rise more than a foot or two, so that they are dangerous only for the little ones. Behring's reasons for considering that consumption is frequent in childhood, however, are quite apart from this.

The conclusions to be drawn from the views of these two acknowledged authorities are startlingly different. Koch would end consumption by taking care of the sputum of consumptives, and insists that if he could sterilize all the secretions and excretions of patients suffering from the affection he would be able to eradicate the disease. Behring considers that this is only a secondary means of protection for human beings, and that while undoubtedly the scattering of sputum should be prevented, the thoro enforcement of all the regulations in this matter would not prevent further development of tuberculosis, since most of it comes, not from other human beings, but from animals, and especially from the cow. Koch considers the care of cattle as a work of only slight value for the prevention of human tuberculosis, while Behring insists that it is the most important element in the consumptive problem. The two men could not well be further apart in their views, and the fact that both are leaders in thought only emphasizes how much medicine at the present moment is in this regard in a state of transition.

One thing, however, is perfectly clear from this discussion, and that is that it is above all, in the early years of life, that precautions must be taken to pre-

vent the acquisition of this dread disease, which carries off so many young people just as they reach adult life. Both these specialists are a unit in declaring the susceptibility of the child, and it is evident that not only the infectious possibilities of inspired dust must be recognized, but that also the possibilities of food becoming an agent for the carrying of infectious material must never be forgotten. There have been curious ebbs and flows of medical opinion in this matter, and at times the food infectious factors have been thought quite negligible. The results are so serious that evidently both sets of precautions should be taken, and not only the better housing, but the better feeding of the poor in our large cities must be looked to if the upper classes are to be free from the danger of tuberculous contagion, which the presence of the poorly fed in crowded centers of population always brings with it.

With regard to Behring's suggestion that he now has a vaccine which will prevent the development of consumption if used in healthy children, only time can tell the story. A little more than a century ago it looked like utter foolishness to think that people would submit voluntarily to having an attack of cowpox in order to escape the danger of smallpox. Now all the world is agreed that this is a perfectly sensible mode of action, and tho in spite of all the improvements in vaccine materials and the precautions taken with regard to it, there is a slight death rate from vaccination, all the world of sensible people willingly submits to it. It is possible that tuberculous parents may realize the dangers for their children with sufficient poignancy to make them readily permit their children to be treated by Behring's new method, but the outlook is even less hopeful than it was one hundred years ago for vaccination. In the meantime Behring's methods applied to cattle are known to be successful in preventing them, and it is possible that the widespread use of his vaccine material may so lessen bovine tuberculosis that there will eventually be no tuberculous milk to become a source of contagion for infants. This is the more hopeful side of his article.

Senator Spooner's Resignation

Senator Spooner, one of the ablest and most useful and most experienced members of the United States Senate, has sent in his resignation of that office to the Governor of Wisconsin. He gives only one reason for this act, two years before his term expires, namely, that he cannot afford to keep the office. To his great honor he has refused to engage in private business while in office, fearing that it would interfere with his public duties. This is a conscientiousness that might be commended to other legislators, some of whom are in prison for overdoing private business. But while we honor his scruples while in office, we are not quite so certain that he sets a good example in resigning for the sole reason given that he feels it his duty to himself and his family to return to a more lucrative profession. That raises the question what are one's duties to himself and his family in the matter of money. The Senatorship will give a fair and sufficient income for one to live very modestly, and even to save enough to educate one's children. To be sure, he cannot in that case entertain very much, but he can live decently. If a soldier must put his country before his own life or the comfort of his family, may not any other citizen be drafted to a similar service? It is not necessary to leave wealth to one's children; they may be better without it. But it is necessary to obey one's country's call, with something of that same spirit of self-sacrifice, and even the sacrifice of one's household, which Socrates expressed when explaining why he did not escape the doom of death. But we may presume that Senator Spooner modestly believes that Wisconsin has many other citizens who can serve the State and the nation as well as he. Yet they have not his experience.

Mrs. Eddy's Sanity

Whether or not Mrs. Eddy is legally competent to manage her own affairs is likely to be settled by court proceedings, inasmuch as her son and other relatives have brought the question for decision. The effort has been assiduously made by those who are next to her to prove her

in good mental condition, but her son, who visited her a few weeks ago, declares that she is so weakened in body and mind as to be incompetent, and that seems to be the public impression, growing out, partly, from the result of the attempt not very long ago to show her to a body of newspaper reporters. That call was cut so short that it left an unfavorable impression, notwithstanding her letter to THE INDEPENDENT and the assurance of her attendants. Whether or not she is in sound mental condition is, we presume, of no ecclesiastical importance, for it has never been pretended that she was immortal, or that she would not, in the ordinary course of nature, grow feeble as she grew old and die like other frail mortals. Christian Science does not exclude death or senility. And we should be surprised if so shrewd a woman, and so well guarded, and one who had so clear a view of the value of money, had not made her will years ago —her advisers would not have failed to see to that. Doubtless her wealth—and it must be very large—will go, as it should go, to the support of her organization. It came from the devotees of Christian Science and should go back to them, rather than to her relatives, with whom she had and sought no close relations. It is a pity that the leaders of new religious revelations, like Dr. Dowie and Mrs. Eddy, could not go up in glory like Elijah, or disappear at a good old age like Moses on Mount Nebo, with eyes undimmed and natural powers unabated, while some Elisha watches the fiery chariot ascend. and receives the prophetic mantle, or some Joshua survives to lead the victorious host. But they die like common men and perish like one of the people.

Technologic Sense

One of the most hopeful signs of intellectual and moral sanity on the part of institutions of education appears in the refusal of the authorities of the Massachusetts Institute of Technology to allow the senior class to graduate in cap and gown. Fifty years ago graduating classes appeared on the stage drest like other young gentlemen, in masculine attire. Then, like an infection which becomes an epidemic imported from abroad, a craze came over our colleges. It was thought that collegians were somewhat different generically from other humans, and must have their heads roofed with square boards, and their bodies swathed in black gowns, a separate third sex, like men, women and priests. Then even the grave dons foregathered in council and decided to distribute the polychrome scale of hoods between universities and professions, so that the reverend doctor of divinity might be distinguished from the prismatic hue of the learned doctor of laws. Thus modest scholarship was transformed to the dudish display of clothes, so that an academic procession became a show of flowing silk and quatre-cornered head-gear and variegated colormaniac linings of hoods, which we gazed upon instead of on discrete and discreet scholarly men. It ought to be the policy and the principle of educated men never to separate themselves conceitedly from others, but to remember that they should know enough to be the most democratic of all men and be one with those about them, and above all things make no display of assumed privileges. It is as vulgar for collegians to make a show of superior learning, which very likely they don't possess, as it is for millionaires to make a show of their wealth. We are not surprised that this protest comes from an institute of technology, for its students and graduates are devoted to studies that put them in blouses, and ally them most to the work and business of ordinary mortals.

The London Election

The election to the London County Council has gone against the Progressives and in favor of the so-called Reformers. It is a temporary misfortune, but not so great as it might seem. For eighteen years a Progressive majority has been providing a better London with public utilities provided out of the public purse. Under better sanitary conditions the death rate has been reduced. The fire brigade has been doubled and fires reduced to a minimum. Some 2,500 acres of parks and breathing spaces have been opened to the people, and filled with games and

music and temperance refreshments, and the drink bill has gone down. The South of London has municipal tram cars said to be the finest in the world, and they pay, after providing $1,500,000 for street improvements. They have supplied steamboats for river travel and excursions that already almost, but not quite, pay the cost. The complaint is of increase of taxation; but that increase has been very moderate, and to make it seem large the enemies of municipal ownership, in their attack on "progressive Socialism," have had to add in the capitalization of tramways that pay a profit. What they really fear is the equalization of taxation, under which the money of the Westminster district would have to bear their burden of supporting the expense of caring for the slums. And with Westminster have been the breweries and all the public houses; and they have raised a terrible cry for retrenchment and against "Socialism." Their ends are divid-ends, and they are temporarily successful. But what has been secured cannot be immediately lost; only further progress and fair taxation will be postponed.

Under the ban the Sacred Congregation of the Index has, at its last session, placed the following books: The Abbé Lefranc's "The Conflict of Science and Religion," Paris; "Jesuitism and Its Abuses," and "Crisis of the Company of Jesus," Madrid, by Sigismundo Pey-Odeix, and "The Biblical Question in the Nineteenth Century," Paris by the Abbé Houtin. The usual prohibition is added as follows, in good Latin:

> "Therefore, let no one, of whatever rank or condition, dare in future, in any place or in any language, either to publish, or to read, or to possess the aforesaid condemned and prohibited books, under the penalties assigned in the Index of Prohibited Books."

The last of these books we have in our library. Will it be allowed to give it away or must we make an *auto da fe* of it?

Goldwin Smith thinks simplified spelling would not do anything to make English a universal language, because the language has no grammar, no declensions and conjugations. It had them once, but the people did not like them and sloughed them off, and English does very well without them, and is for that reason in a fair way to be an easily learnt common tongue. Goldwin Smith also fears that simplified spelling would jettison our books. That seems the littlest of all bogeys. Those who read THE INDEPENDENT easily can easily read all the books that spell *honour* for *honor*. It is a slow, gradual reform, hardly noticed by the ordinary reader.

If we can believe the newspapers, the Rev. Dr. Burr, lately pastor of the Baptist Church at Newton, Mass., committed suicide by allowing himself to be run over by a railroad train. It is said that his liberal views—open communion, so far as we know—caused his removal from his pastorate, and that he could not be given another Baptist pastorate. We much doubt that statement; but this sad tragedy suggests a third way for those guilty of too liberal views, in addition to those recommended to the "Undistinguished Heretic."

We regret to record the death of Wendell Phillips Garrison, son of William Lloyd Garrison. For a year or so in the middle sixties he was one of the editors of THE INDEPENDENT and was always its friend. His main work, however, was in the conduct of *The Nation*, which he made for a time the leading literary journal in the country. He was a man of the highest ideals, able, faithful and useful.

Secretary Taft has scored one victory with the present Congress—he has persuaded Congress to enact the bill for an agricultural bank in the Philippines, such as has done so much for Egypt. That will do a little to remove the suspicion in the Philippines that Congress has no care for their interests. And yet they are frightened at the thought that Japan will capture them as it has taken Formosa.

President Roosevelt's second term is now just half thru, and men now ask what he will do when he leaves the White House. He has always been in public life and we hope he will remain so. New York will need a new Senator just then, and who could better represent the State?

Insurance

The Mutual Life Insurance Company

THE new Mutual Life Insurance Company, now fully reorganized and under the presidency of Charles A. Peabody, may justly be pardoned if it indulges in a bit of complacency regarding its financial condition and the progress it has made during the past sixty-four years. The company and its policy-holders may alike be congratulated upon the figures of last year's transactions, now published, from which it appears that the Mutual obtained $87,347,284 in new paid-for insurance. At the close of 1906 the company had in force $1,517,257,180, while its income arising from premiums aggregated $58,317,866.55, and the total sum held in trust for the company's policy-holders was $495,864,649.58. In benefits to policy-holders the company is unexcelled. It paid to members and their beneficiaries during 1906 in death claims, endowments, dividends, surrender values, etc., $37,736,684.24. In the same year it added to the funds held in trust for policy-holders, $25,003,483.68. The total benefits to policy-holders during the year were $62,740,167.92. The company received from policy-holders in premiums $58,317,866.55. The benefits to policy-holders during the year exceeded the amount received from them by $4,422,301.37. In the matter of gains for policy-holders the Mutual has broken all previous records, and that, too, in the face of circumstances that were tremendously adverse. Since the date of its organization the company has paid to policy-holders and their beneficiaries $739,350,923. It holds for policy-holders, etc., $495,864,650. Total benefits to policy-holders have been $1,235,215,573. In sixty-four years it has received from policy-holders $1,134,005,635. Excess of benefits to policy-holders, $101,209,938. That is to say, in the sixty-four years of its existence, the Mutual Life has paid to policy-holders and their beneficiaries, and still holds in trust for them, more than one hundred million dollars in excess of all that it has received from them. The present management is a decided improvement over the previous regime in the way of conservatism and economy. The company has never, for a single moment, had its solvency questioned, and its traditions as one of the giants have not only been preserved, but carried triumphantly forward from one towering landmark to another.

George W. Perkins Not Guilty of Larceny

THE Court of Appeals, by a decision reached at Albany on February 26th, upholds the opinion of District Attorney Jerome that, irrespective of the moral and ethical aspects of the case, George W. Perkins, as a vice-president of the New York Life Insurance Company, was not guilty of larceny in the use of funds of the company for contributions to the Republican campaign fund in 1904. The decision reached affirms the order of the Appellate Court, declaring that no crime appeared from the facts stipulated. The opinions of the Appellate judges all agree, however, that his conduct is open to criticism in disposing of the company's money for the purposes stated and that he gave the money illegally.

The victory for Mr. Perkins was won by a narrow margin, since the Appeals bench stood four to three in his favor.

Insurance Reformation in Missouri

GOVERNOR FOLK, in his recent message to the Missouri Legislature, recommended a number of acts bearing upon the insurance companies. The Governor's recommendations included a standard policy for all life companies, the prohibition of discrimination and rebating, the regulation of the election of directors and the requirement of the investment within the State of not less than 70 per cent. of the premiums received from Missouri policy-holders.

Financial

Mr. Shaw Comes to New York

LESLIE M. SHAW, Secretary of the Treasury for the last five years, was elected, in New York on the 26th ult., president of the recently organized Carnegie Trust Company. It was understood that he would assume the duties of this office immediately after the 4th inst., the date of his voluntary retirement from the Cabinet. Charles C. Dickinson, who organized the company and had been serving temporarily as president, accepted the office of honorary first vice-president. It was by Mr. Dickinson that Secretary Shaw was induced to become the head of the institution. We printed on January 31st the names of the other officers. Among the directors are Alton B. Parker, Charles M. Schwab, Arthur P. Heinze, A. B. Chandler, J. W. Harriman, Robert B. Armstrong and James Talcott. Mr. Armstrong (president of the Casualty Company of America) was formerly Mr. Shaw's private secretary at Washington, and afterward was associated with him as Assistant Secretary of the Treasury. At the meeting of the directors on the 26th ult. the capital stock was increased from $1,000,000 to $1,500,000 and the surplus from $500,000 to $750,000. The greater part of the additional amount has been paid in by Mr. Shaw and his friends.

The retiring Secretary of the Treasury has been regarded as a candidate for the Republican Presidential nomination. On the 26th ult. he was asked to say what he thought would be the effect of this business venture upon his political future. In reply he made a statement of considerable length, beginning as follows:

"A man by taking thought may make himself a justice of the peace, but no man in my time by taking thought has made himself President of the United States, and those who have given the subject most serious consideration have usually died in disappointment. Admittedly, some of the successful ones have sought the place, but none was nominated because he sought it. Neither Lincoln, Grant, Hayes, Garfield, Blaine, McKinley, Roosevelt, nor Bryan was nominated because of the State he represented, and some of them secured the prize notwithstanding location. Cleveland, Harrison, Parker, and possibly one or two other defeated candidates, have been aided by location, though Mr. Cleveland was once nominated in the face of an opposing delegation from his own State. All but two of the men whose names I have mentioned were nominated because of what they were and for what they stood, and the two exceptions were compromises.

"General Grant expressed the correct attitude of an ideal American citizen when he said he had never sought a place of honor or preferment and had never declined one. The honors that have come to me have been unsought. When the alternative of seeking the nomination for Governor of my State or running away from the sentiment was presented I simply took the affirmative of the issue. Whatever Shaw Presidential sentiment now exists has sprung up spontaneously, and unless it continues to grow in the same way my name will never be mentioned in a National Convention. Meantime I will not decline appropriate tasks nor refuse to do my share of the world's work."

For more than thirty years, he added, his home had been at Denison, Ia. That place would continue to be his home. "There will I vote, there will I spend a remnant of my days if I live past retirement, and there will I be buried." His interest in political campaigns would not flag, altho the opportunity to participate in them as actively as in the past might be wanting. "It will be for my party to determine," said he in conclusion, "whether I am again invited from the congenial fields of personal endeavor to the perplexities of public service."

....Japan is about to convert her two 6 per cent. war loans of 1904 by an issue of $115,000,000 of bonds at 5 per cent., to be offered at London and Paris.

....Charles W. Morse and his associates now control seven coastwise steamship lines, which have eighty-four ships and are capitalized at $60,000,000 in stock, with $22,721,000 in bonds.

....E. R. Thomas has been elected president and William R. Montgomery vice-president of the Hamilton Bank, which is closely associated with the Mercantile National Bank. Jesse C. Joy continues as cashier.

....Among the bills passed before the adjournment of Congress was the Currency bill, which authorizes the deposit of customs receipts in the banks, and increases from $3,000,000 to $9,000,000 the amount of national bank circulation which may be retired in any one month.

The Independent

VOL. LXII NEW YORK, THURSDAY, MARCH 14, 1907 No. 3041

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Forest Reserves

By issuing proclamations prepared and signed before the Agricultural Appropriation bill became a law, President Roosevelt has added about 17,000,000 acres to the area of the forest reserves. After that bill became a law he could not have done this. During the recent session of Congress, attempts were made by certain Senators and Representatives from the Far West to reduce the appropriations for the administration of the Forest Service and to prevent any enlargement of the forest reserve area. Prominent in this movement were Senators Fulton, Heyburn and Carter. What was known as the Fulton amendment was attached to the appropriation bill and finally accepted by both houses. It forbids the creation or the enlargement hereafter, except by act of Congress, of forest reserves in Oregon, Wyoming, Washington, Montana, Idaho and Colorado. Under the direction of the President, preparation had been made for creating several reserves and adding to the area of certain reserves now existing, and for this purpose 17,000,000 acres had for some time been withdrawn from entry. Mr. Roosevelt knew, of course, that after the appropriation bill became a law he could not make a reserve or enlarge one in any of the six States. He decided to act before attaching his signature to the bill. His proclamations, signed and dated on the 2d, were made public on the 4th, the day when Congress adjourned at noon, and when he signed the appropriation bill. His action was resented by the Senators who had sought to prevent it. Some persons interested in the lumber trade are said to have been sorely disappointed. With his proclamations the President made public the following statement:

"These forest reserves were determined upon and the preparation of the necessary papers ordered some months ago—in two-thirds of the cases some years ago—in the exercise of the duty imposed upon me by act of Congress of March 3, 1891. The utmost care and deliberation have been exercised in deciding upon the boundaries of the proposed reserves; in all but a very few cases long continued and detailed field examinations have been made, and in the remainder examinations amply sufficient to justify the proposed action.

"The necessary proclamations under existing law now come before me, and the question is presented whether I should refrain from acting under the existing law because there is now under consideration by Congress a proposal to change the law so as to require Congressional action upon the establishment of such forest reserves. If I did not act, reserves which I consider very important for the interests of the United States would be wholly or in part dissipated before Congress has an opportunity again to consider the matter; while under the action which I propose to take they will be preserved; and if Congress differs from me in this opinion it will have full opportunity in the future to take such position as it may desire as to the discontinuance of the reserves, by affirmative action, taken with the fullest opportunity for considering the subject by itself and on its own merits. If by any chance land more valuable for other purposes than for forest reserves is shown to have been included in these reserves, I shall forthwith restore it to entry.

"Failure on my part to sign these proclamations would mean that immense tracts of valuable timber would fall into the hands of the lumber syndicates before Congress has an opportunity to act, whereas the creation of the

reserves means that this timber will be kept in the interest of the home maker; for our entire purpose in this forest reserve policy is to keep the land for the benefit of the actual settler and home maker, to further his interests in every way, and while using the natural resources of the country for the benefit of the present generation, also to use them in such manner as to keep them unimpaired for the benefit of the children now growing up to inherit the land. This is the final and exclusive object, not merely of our forest policy, but of our whole public land policy.

"THEODORE ROOSEVELT."

Thirty-two reservations are created or enlarged by the proclamations. All but two of them are in the area covered by the six States named in the Fulton amendment. In another statement, Gifford Pinchot, Chief Forester, explains the purpose and the practice of the Government with respect to the reserves. The national forests are reserved, he says, with the main object of using all their resources in the wisest way. The timber, the range, the water and the land are for use. Included tracts of agricultural land are passing to private ownership under the act of June 11th, 1906:

"The miner is better off in a national forest than on the unreserved public domain. The minerals laws apply in precisely the same way. The prospector can explore and locate his claims without the slightest restriction. All timber and wood in the national forests is for use, and for prompt use. It is sold to the small man and to the big man. Everybody who needs timber to establish his home gets it free of charge when he asks for it. In the sale of timber there is no chance for monopoly, for the Secretary of Agriculture can sell as much or as little as he pleases, to whomever he pleases and for whatever price he deems fair for the best interests of all the people. The Government gets a fair return for its timber, whereas before, under the timber and stone law, it practically gave it away, and in such a manner that it was monopolized in vast tracts by corporate interests. And after it was cut off the land was burned over and became a nonproductive waste. The land is used for the grazing of live stock."

On the new reserves, he adds, there will be no interference with the grazing industry, nor will any grazing fee be charged during the present season. The land in all the reserves is freely open for use as sites for hotels, stores, mills, residences and all legitimate purposes. The greatest possible proper use of the land is desired, and all improvements are welcomed. This statement is an answer to points of criticism made during recent debates in Congress.

Prosecution of Trusts

The prosecution of the Standard Oil Company upon indictments found in August last and involving 1,903 counts was begun at St. Louis on the 4th, the charge being that the company unlawfully accepted special low freight rates from several railroad companies. The proceedings are in the United States Circuit Court, before Judge K. M. Landis. It has been decided that non-resident witnesses (one of whom is John D. Rockefeller) must come to St. Louis and testify. Unsuccessful attacks upon the indictments were made by the defendants' counsel, who sought to take advantage of all technical points. Their claim that the rates were not in violation of the Federal law was based upon an assertion that the service was wholly in one State. It was not sustained. Two or three weeks may be consumed in presenting the documentary evidence. One member of the jury very closely resembles Mr. Rockefeller.——In New York, the American Sugar Refining Company, commonly known as the Sugar Trust, has been sued by the Pennsylvania Sugar Refining Company, of Philadelphia, under the Sherman act, for $10,000,000 damages, which may under the law be increased to $30,000,000 if the plaintiff is successful. This suit grows out of the failure of the Real Estate Trust Company, which was followed by the suicide of its president, Frank K. Hipple, and it is really brought by George H. Earle, Jr., who was the receiver of the Trust Company and is now president of it. Hipple was associated with Adolph Segal, a promoter and speculator, who had built the sugar refinery of the Pennsylvania company, and was engaged in erecting a hotel. For this latter project he obtained a loan of $1,250,000 in New York from Gustav E. Kissel, a banker or broker. A part of the security was a majority of the stock of the sugar company, accompanied by an agreement permitting the lender to use this majority in controlling

the property. This was in December, 1903. Altho the refinery was ready for use, the lender, or lenders, closed it and have kept it closed ever since. It is alleged by the plaintiff that Kissel represented the Sugar Trust, altho he had assured Segal that he was in no way the Trust's agent; that the agreement had been in fact prepared by John E. Parsons, vice-president of the Trust, and approved by President Havemeyer; and that the defendants (the Trust, President Havemeyer, Vice-president Parsons and others) conspired to keep the new refinery closed and are guilty of unlawful restraint of trade. It is reported that the Government will bring suit for a dissolution of the Sugar Trust, relying upon the evidence in this case and in the rebate cases recently tried.

The Railways

Increases of freight rates are reported from many points. The rate for bituminous coal in the East has been made higher by 5 cents a ton, or about $2 per car. Grain rates from the Mississippi Valley to the Atlantic seaboard will be increased on April 1st. Notice is given of an increase of 10 per cent. on grain from the lakes to the seaboard on April 15th. Increases on iron products and some other heavy commodities are announced. They range from 5 to 30 cents per ton.——A two-cent passenger fare bill has been passed by unanimous vote in the Illinois House. The new two-cent law of Nebraska became effective on the 9th. Several passenger trains were discontinued, one of them being the Los Angeles Limited, heretofore running between Chicago and Los Angeles over the Northwestern, Union Pacific and San Pedro roads. Passengers coming to Nebraska are required to buy tickets at the State line and to have their baggage rechecked there. All excursion or commutation rates and other reductions of fare in Nebraska have been cancelled.——The Sunset Limited train on the Southern Pacific road was "annulled," or prevented from continuing its journey Westward, on the 8th, at Houston, by the Texas authorities, because it was 50 minutes late at that point. This action was taken under a new law of the State, and in obedience to a recent order of the Texas Railroad Commission requiring trains to run within thirty minutes of their schedules. The train was carrying about 200 passengers, who were traveling from the East to the Pacific Coast. Thev were delayed at Houston for twelve hours.

Mr. Harriman's Views

The visit of Mr. Harriman to Washington and his conversations there with representatives of the press have excited interest thruout the country. It is expected in Washington that the Government will demand that the Union Pacific dispose of its holdings of Southern Pacific stock. Since the recent hearing in New York, attention has been directed to the fact that Mr. Harriman while testifying was not questioned concerning the ninety-nine years' contract with Senator Clark's road. With respect to that contract, therefore, he did not acquire immunity. The transaction is regarded by the Commission as one that was clearly in violation of law. Some newspaper correspondents in Washington say that Mr. Harriman may be prosecuted under the criminal provisions of the law for his connection with it. Altho Mr. Harriman has been known as a reticent man and one whom reporters could not reach, he talked very freely in Washington for publication, and long interviews with him have been published since his return to New York. He now seeks publicity and admits a change in his attitude toward the public. The railroads, on the one hand, he says, should co-operate with the people and the Government, on the other. There is need of a better understanding between the roads and the public. Mistakes have been made on the side of the roads, he says, and some of the railway managers have neglected to seek the good will of the people. The new Rate law, in his opinion, will do no harm if it be properly administered. There is need, however, he asserts, of a law permitting the making of combination agreements. With such a law, he says, railroad companies would not find it necessary to make large purchases of the shares of other lines. The railroads of the United

States must be rebuilt, he says, with tracks having a gauge of 6 feet in place of the present standard gauge of 4 feet and 8½ inches. This will permit the use of much larger cars and more powerful locomotives. The cars must be of steel. To support the heavier rolling stock, the bridges must be rebuilt. All this "will cost billions," but he says it will certainly be done within ten years. Other prominent railway men admit that a broader gauge is to be desired, but point to the difficulties attending a change, unless it could be made for all the roads at the same time. President Winchell, of the Rock Island, remarks that there would not be money enough in the country to pay for such a change. It would be necessary to rebuild all bridges, and all the cars now in use would become useless.——It is said that the Attorney-General of Illinois will attack the validity of the $32,000,000 Chicago & Alton mortgage issued by the Harriman syndicate. This was one of the financial transactions as to which Mr. Harriman was questioned by the Commission.

The Panama Canal

Lieutenant-Colonel Goethals and Major Gaillard have sailed for the Isthmus on a steamship carrying nearly fifty members of Congress. They were preceded by Speaker Cannon and several other members on another ship. Chief Engineer Stevens is now Chairman of the Commission, and he will hold the office until Lieutenant-Colonel Goethals takes charge of the work. The latter's salary will be $15,000; Mr. Stevens's has been $30,000. It is expected that Rear-Admiral H. H. Rousseau, a civil engineer of the navy and now Chief of the Bureau of Yards and Docks, will take Rear-Admiral Endicott's place in the Commission. The other members will be the three army engineers (Goethals, Gaillard and Sibert), Colonel Gorgas, Jackson Smith and ex-Senator Blackburn. Secretary Joseph B. Bishop has charge of the Washington office. Those who submitted the pending propositions for supplying Chinese labor have been informed by the War Department that no action upon them will be taken. If occasion arises for a renewal of the propositions, these bidders will be notified.

Cuba and Porto Rico

A report is soon to be made by the Commission that has been devising a new system of election laws and regulations, and it is expected that the new rules will be a defense against fraud in registration or at the ballot box. The temper of the people and the quality of the new laws will first be tested at municipal and provincial elections, probably in June next. By filling the local offices at an honest election the cause of much political friction and intrigue will be removed. By the character and results of these local contests our Government will be guided in preparing for a national election, which will probably be held about six months later. It is expected that the program will be made known in Havana by Secretary Taft during his approaching visit to the island. He will start on the 24th. It is absolutely certain that the people are to have another opportunity to set up and maintain a government of their own. Our Government will not now listen for a moment to any proposition from Cubans or others concerning a protectorate. But the prevailing opinion in Washington is that if the islanders do not improve this opportunity they will not have another.——A procession of 500 horsemen, attended by bands of music and led by General Monteagudo, recently passed thru the streets of Havana and then submitted to Governor Magoon a petition, asking him to revoke the order which prohibits cockfighting. A deep interest in this matter is shown even by the political leaders. It is said that the average Cuban laborer was formerly accustomed to work four days in a week for the support of himself and his family, one day for investments in the lottery, and one for the expense of cockfighting; and that now, having neither lottery nor cockfighting, his week's work ends with the fourth day.——Beekman Winthrop, Governor of Porto Rico, has been appointed an Assistant Secretary of the Treasury, at Washington. His successor is Regis Henri Post, now Secretary of the Insular Government. Mr. Post's home is at Bayport, Long Island (N. Y.); he was graduated at Harvard in 1891, has been admitted to the bar, was a member of the New York Assembly for one term, and is a prominent yachtsman.

The War in Central America Conflicting reports about recent battles in the war between Honduras and Nicaragua have been received, each side claiming victory. The armies are in Honduran territory, but near the boundary. There were sharp engagements on the 6th and 7th, at Namasiquo and in the vicinity of that place. It is asserted that Nicaragua suffered a serious defeat at Tugare on the 8th. One of the Honduran Generals is Lee Christmas, an American from Memphis. President Bonilla (of Honduras) is at the front, and revolutionists are at work behind him. It is reported that they have already taken possession of several towns. These revolutionists support Sierra, whom Bonilla ousted from the presidency. Sierra himself, with several revolutionist generals, is with the Nicaraguan army of invasion. Late reports say it is expected that Guatemala, Salvador and Costa Rica will decide to assist Honduras, believing that President Zelaya (of Nicaragua) if successful, would seek to make himself master of all the five Central American countries. The United States will not intervene, but, with Mexico, will continue to exercise diplomatic influence for a restoration of peace. Our Minister, William E. Merry, complains to the State Department that he was badly treated by the Nicaraguan authorities recently. It appears that he quarreled with Zelaya concerning the settlement of a claim. Unauthoritative reports say that his baggage was searched.

Woman Suffrage in the House of Commons The bill introduced into the House of Commons by Willoughby Dickinson, providing that women should have the franchise on the same terms as men, was defeated on March 8th, by being talked down, without coming to the vote. It is thought that there was a clear majority in favor of women's rights, and most of the Ministry and the leaders of the Opposition supported it, but the Government was unwilling to force the bill thru the House by declaring the closure, which corresponds to our "previous question." The Liberal leaders considered that they had enough reform measures on hand to carry against the opposition of the House of Lords without any addition to the burdens of the administration. The Prime Minister, Sir Henry Campbell-Bannerman, stated that he was in favor of the principle of woman suffrage and would vote for the bill as a declaration of his opinion that the exclusion of women from the franchise was not expedient, justifiable or politically right. Women could not longer be treated as "uitlanders." He confessed that he was not enamored with the present bill, because it would not enfranchise working class women to the same extent as other classes. In the discussion that followed no attention was paid to party lines. Mr. Whitehead, Liberal, moved the rejection of the bill, and Mr. Cremer, a working class Liberal well known as the organizer of the Interparliamentary Union, supported his motion. Philip Snowden, Socialist, said that the bill would enfranchise a million and a quarter women, 82 per cent. of whom belong to the working class. John Massie, Liberal, was opposed to the enfranchisement of women because of their physical inferiority. They could not be fought. If complete adult franchisement were adopted, the government of the country would pass into the hands of women, because there are 1,000,000 more women than men in Great Britain. A petition was brought into the House in the form of a great roll of paper signed by 21,000 women in opposition to the bill. The opponents of woman suffrage held the floor until 5 o'clock, when the session closed automatically. In the evening an indignation meeting was held in Exeter Hall to denounce the Government and to call upon the women of Great Britain to unite against it. The Prime Minister was attacked in the most violent language, and it was resolved to start active campaigns in all districts whose representatives had opposed the women in Parliament. Among the speakers at this meeting was the Rev. Mr. Aked, who recently has been elected pastor of the Fifth Avenue (New York) Baptist Church. He said he had come away from listening to the debate in the House with a sense of defeat, dismay and disgust, and added as his opinion that "nothing since the coming of Christ would do more for

humanity than the enfranchisement of women." Mr. Snowden said that the divine right of kings and aristocrats had been broken down, and now they would have to break down the belief in the divine right of men. Israel Zangwill used his powers of satire and wit against the anti-suffragists who were traitors to their sex. He did not believe that Eve was always to remain a rib woman. Mrs. Humphry Ward, the novelist, has written to *The Times* expressing her belief in suffrage for women in all local elections, but opposing the Parliamentary vote because it affects imperial matters in which women have no responsibility of action. Marie Corelli has issued a pamphlet against woman suffrage in which she puts the momentous question: "Shall we make a holocaust of maidens, wives and mothers on the brazen altar of party?"

Paris in Darkness

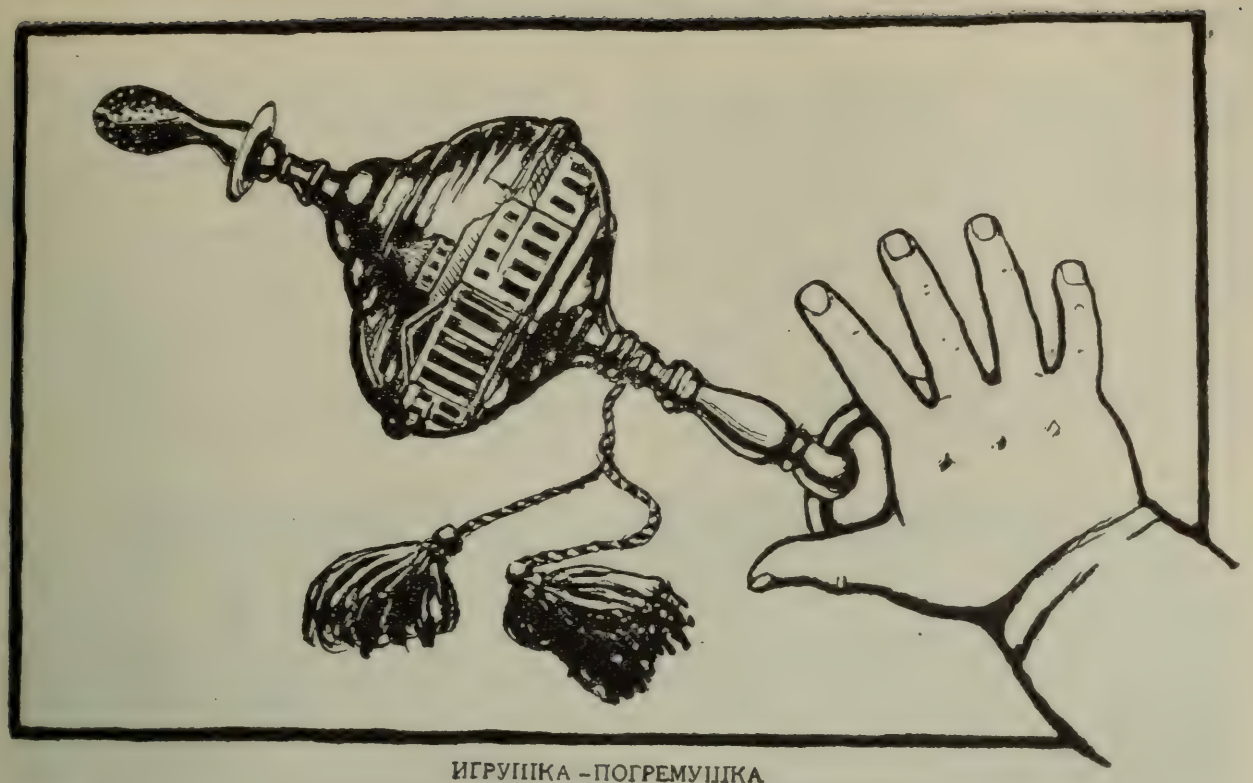
A sudden and entirely unexpected strike of the electricians of Paris at 5 o'clock Friday afternoon kept the public buildings of the city in darkness for two nights and interfered with many industries thru the shutting off of their power. Most of the streets are lighted in part by gas, but those supplied by electricity were left in complete darkness except for the lanterns which were hung out from the houses and the torches carried by the police. In the boulevard cafés and restaurants which did not have individual lighting plants the tables were lighted with old lamps and with candles stuck into empty bottles. The Post Office sent out to buy hundreds of candles and bushels of potatoes to serve as candlesticks. The Prefecture of Police, the buildings of the Ministers, and the Elysée Palace were deprived of illumination. The Senate and the Chamber of Deputies were provided with gas. The Grand Opera and almost all of the theaters were obliged to close and refund their money. But in some of the minor theaters and concert halls acetylene lamps from automobiles and Chinese lanterns were used to light the stage. The newspapers were the chief sufferers, as most of them depend upon electrical power for the presses. The *Petit Parisien* prints its 2,000,000 copies a day by its own plant, and this and a few other papers similarly equipped loaned the use of their presses to other papers after their own editions were off. In front of many newspaper offices during the night and day portable steam engines and automobiles were stationed, by which it was endeavored, without much success, to run the presses. The shutting off of the electric light from the caissons used in the construction of the subway tunnels compelled the workmen to leave hastily, and since the electrical pumps were also stopped the subway filled with water, causing some damage to its walls and foundations. The Labor Exchange, which was lighted by electricity, was closed by order of the Prefect of the Seine, so the strikers were not able to hold their meetings there as planned. The only part of the city which did not suffer was that lighted by the municipal plants. The object of the strike, which was confined to the employees of the private companies, was to secure the same rights and privileges as the municipal employees, especially old age pensions and vacations with full pay. In the Government electric light service each employee has two months' vacation with pay every year, and is allowed another month with pay in case of sickness. Usually the workmen take advantage of this to secure three months' vacation. It is calculated that $1,400,000 would be required by the private electric companies to supply the pensions demanded by the workmen. The strike was closed by a combination of promises and threats by the Government. M. de Selves, Prefect of the Seine, negotiated with the leaders of the strike and agreed to see that they got the same treatment as the municipal employees. The men will have a weekly day of rest, pensions and vacations, and will be re-employed after their term of military service expires. The demand for an eight-hour day was postponed for further consideration. The men have been getting on an average $44 a month for ten hours' daily work. The indoor men have had 52 days' rest annually with pay, and the outdoor men twenty-six days. The strikers numbered about 1,300 skilled workmen whom it would be difficult to replace. Premier Clemenceau issued orders that the military engineers and electricians should take charge of

the electrical light and power plants in case the strike was not settled.

The New Duma

Russia's second Parliament, composed of the Council of the Empire as the upper house and the Duma as the representative body, opened its session on March 5th. The Council met in a hall in the center of the city and was called to order by its President, Baron Frisch, after the singing of the Te Deum and the national anthem. Count Gortchakoff presented a resolution of sympathy with the widow of General Alexis Ignatieff, a member of the Council, who was assassinated by the revolutionists at Tver, December 22d, and a memorial session was devoted to him. The Liberal members of the Council did not oppose this action. Greater interest, of course, was attracted by the Duma, which met as before in the Tauride Palace. In the entrance hall the Metropolitan of St. Petersburg, Antonius, and the accompanying clergy intoned a Te Deum, to which, however, most of the members paid little respect. The Metropolitan then addressed the members, urging them to forget their differences and work together for their suffering country. He compared the Duma to the disciples whom Christ called together and thru whom his will prevailed, altho one of them was a traitor. After singing the national hymn twice with cheers, the members filed into the hall and took their places. Premier Stolypin and all of the ministers except those of War and Marine were present. Vice-President Golubeff, of the Council of the Empire, entered the President's tribune and greeted the Duma in the name of the Emperor, and Baron Gyldenbandt, Secretary of State, read the imperial ukase convening the Duma and defining its duties. At the mention of the Emperor's name, Mr. Krushevan, the anti-Semite Deputy from Kishineff, arose and called for three cheers for his Majesty. Only the Conservative members responded; the Center and Left remained seated in silence. The Social Democrats, who had remained outside up to this point, then entered and with the other Deputies took the oath of allegiance. The organization of the house had been arranged by caucuses and inter-party conferences, so the entire Opposition, numbering 336, cast their votes for Feodor Golovin as President of the Duma. The candidate of the Government parties received only 102 votes. Mr. Golovin is a member of one of the oldest families of Russia and is highly respected in court circles, in spite of the fact that he has been for many years President of the Moscow Zemstvo, which has led in the reform movement. He is younger and more forceful in character than President Muromtzeff of the last Duma, and possesses the confidence of all parties to a remarkable degree. In his address on assuming the chair he said:

FEODOR GOLOVIN,
The New President of the Duma.



"The principle of popular representation is powerful. Once called to life, it can never die. In unity with the will of the monarch and the hopes of the country the Duma must and will irresistibly advance until its high mission is fulfilled."

President Golovin was cordially received in audience by the Emperor and Empress on the following day. After the adjournment of the Duma, the

crowd of over 20,000 people who had collected before the Tauride Palace marched thru the streets of the capital singing the "Marseillaise" and other revolutionary songs and waving red flags and making demonstrations before the house of the Chief of the Secret Police and the prison where political prisoners were confined. For a time it looked as tho the scenes of "Bloody Sunday," when Father Gapon led a similar procession, were going to be repeated, but the Government had learned how to manage mobs better, and instead of meeting it with volleys from the soldiers, the gendarmes cleared the streets without the use of other weapons than whips. In the election of secretaries and other subordinate officers of the Duma, the Conservative Right was ignored entirely. After the organization was completed an adjournment was taken until March 12th, in order to give an opportunity for the committees on credentials to act on the contested seats, of which there are a very large number. The most serious case is that of Mr. Krushevan, who is charged with ineligibility as being a bankrupt and with fraudulent practices in the election. He threatens if he is unseated to let loose the mob against the Jews and renew the pogroms of Kishineff and Odessa. The Conservatives are supporting him and declare that if he is not admitted they will resign in a body and petition the Emperor to dissolve the Duma. President Golovin has promised the floor to a Social Democratic Deputy, as soon as the Duma is ready for business, in order to demand amnesty for political prisoners. It is understood that the entire Duma, including the Conservatives, will support this demand in so far as it does not include prisoners accused or convicted of murder. The first law to be brought before the Duma will be one for the establishment of the right of habeas corpus, and the second for the abolishing of punishment by the administrative order of local authorities. Premier Stolypin is pressing for an early opportunity to present the budget and the proposals of the Government, some of which cover the reforms demanded by the Duma.

Germany and The Hague

The German delegation at The Hague Conference will consist of Baron Marschall von Bieberstein, the German Ambassador at Constantinople, and Councilor Krieger. Germany is not yet willing to admit the question of limitation of armaments to The Hague Conference, and Professor de Martens, the representative of Russia, is still negotiating at European capitals to check Great Britain in the attempt to introduce the subject. It is reported that if any disarmament proposals are introduced Germany will not withdraw, but will insist upon the specification of the conditions which would regulate the relative war power of the different countries. If the extent of the armament be made conditional on population the navy of Great Britain would have to remain stationary or be cut down, while the navy of Germany would be enlarged. If it is argued that the size of the navy should be made proportionate to the extent of the mercantile marine requiring protecting, the United States would have to reduce its navy. Since it would refuse to do this, Great Britain and the United States would be brought into opposition.——The Government has had its way in regard to the appropriations for German Southwest Africa. Colonial Director Dernburg presented to the new Reichstag a request for a supplementary appropriation of $7,300,000 for military expenses in this colony, and also for $2,225,000 as the first instalment for the construction of the railroad from Kubub to Keetmanshoop. Herr Dernburg stated that it was the Government's intention to declare peace established with the natives March 31st, to withdraw a considerable number of troops before July 1st, and to adopt universal conscription in the colony. The Clerical Center, Poles and Socialists voted against the appropriation as before, but the complexion of the Reichstag has been changed by the last election, so the bill was carried. It is the intention of the Colonial Office to develop the resources of German Southwest Africa so as to make it profitable, particularly by encouraging cotton culture so as to free the German mills from their dependence on the United States.

THE DOUMA—THE PLAYTHING OF RUSSIA.
From the Russian Newspaper *Gudok*.

The Village Against the Czar

BY WILLIAM ENGLISH WALLING

[This week we conclude Mr. Walling's article begun in our last issue, and his striking series of three articles which have explained the present Russian revolution as has, in our opinion, no other writer of the day. Now that the second Duma has assembled, these articles will be of great assistance to any one wishing to understand the problems that will come before it for solution. Mr. Walling is at present in Russia studying the greatest political drama now being enacted in the world. The illustrations used in this article are derived from the collection of Russian cartoons now on exhibition at Columbia University. —EDITOR.]

THIS class war of pillage and arson and murder has already brought about concrete results for the peasants. I have spoken of the moderate measure of reform the Government has promulgated largely under landlord pressure; I have also mentioned the rise in wages and the fall in rents. A much more remarkable and solid benefit has fallen to the peasants as a reward for their successful warfare —the landlords are selling their estates. In the single year since these present agrarian disorders began more than a tenth of the estates of all Russia—*i. e.*, more than 2,000,000 acres—have been offered for sale. What is still more important is that the peasants, expecting a far more considerable fall in prices, if not a free division of the landlords' property, have refused to buy.

The peasants are rapidly and with comparative ease getting the better of the landlords, even to driving them from the country-side. The struggle with the Government, backed as it is by a consolidated power of the landlords and those allies and relatives of theirs, the army officers and the bureaucrats, is a far more serious and protracted matter —in fact, the very substance of the war of the revolution. In this direction the peasants have had far less success, and up to the present time they have gotten decidedly the worst of it.

But let us not suppose that the Government is invulnerable. In every village it has given the people hostages in the shape of the village policeman and the village priest. Both are the subject of constant persecution in those sections of the country that are most advanced. In many cases these local representatives of the Czarism are already dominated by

village opinion; more particularly, of course, the priests. In Kasan the peasants captured several of these local police functionaries and held them until the Government liberated an imprisoned leader of the revolution. Why may this not occur again? Besides these personal pledges there is in every village a valuable property pledge in the shape of the Government saloon from which the Czarism receives a third of its annual income. Every day the official Russian telegrams report the robbery or destruction of some of these saloons. How many are really attacked or destroyed cannot be known. Every day new villages take up the campaign against this Government monopoly. A regular plan of attack has been devised. The village meeting decides that the peasants shall not drink; an agreed schedule of fines is arranged for all those who do—one rouble for the first drink, three for the second, five for the third and expulsion for the fourth.

So successfully have these attacks hit at the Government revenue that the authorities have been forced to the most extreme measures of protection. Already all post offices, railway stations and every visible form of property had to be guarded by soldiers or police. Now the same becomes true of all of the tens of thousands of vodka shops in all Russia —a sufficient sign in itself of the revolution's success. Thru raising the price of vodka to the very limit the traffic will bear, the Government has succeeded so far in retaining the level of its revenue, but it is only a question of a short time before the state budget must show an enormous loss.

Очистка площади.

CLEARING A STREET.
From *Iskra*, a Russian newspaper.

The measures of physical protection are the least interesting of the Government's policies in this matter. In one government of the south, the Governor-General has issued an order that *any village which has boycotted the saloon must be made to pay in direct taxes the same sum which that saloon produced for the Government the year before.* The Government has always encouraged the use of the vodka poison. It is now compelling it by nagaikas and bayonets.

The warfare of the village against the Government is being worked up into a science. The revolutionary bodies are directing the work, but the peasants are

quick enough to understand. Last year, for instance, many of the villages destroyed the place of alcohol monopoly openly. This year they take a vote against the saloon, and a secret committee, appointed by the central revolutionary authorities of the district, carries the plan into effect. I was in a small village of Saratoff a few weeks after the Duma had closed. A middle-aged, intelligent and self-educated villager was explaining to me the advantages of the new system. He described how the participants in the destruction of the saloon the year before were beaten by the Cossacks, and he said that the mistake would not be repeated this year. He told me that the village had decided that the saloon was to go, and that the secret committee, composed of half a dozen peasants of the community, would see that the design was carried out. Within a week after I had left the village I read in the papers a telegram stating the destruction during the night of that saloon.

Every possible form of worrying the Government, of upsetting the authority of the local officials, of cutting off the Government's income from the village, of implanting the spirit of mutiny among the new recruits, of coercing the landlords, is being embodied by the revolutionists into a regular revolutionary code. This is not being done on theoretical grounds, but congresses of local and village committees have been held all over Russia to discuss the best means for carrying out the war. It is generally recognized that the time for concerted action in the country at large has not yet arrived, and it is evident to the outside observer that it will not even arrive so soon as the revolutionists hope. What is sought now is not the common action of several villages, but the comparative study of the best modes of action for each individual community. So well do the villages understand that some have not only absorbed the new program, but have undertaken to spread it far and wide among the neighboring communities. I visited one village, for instance, where practically everybody was active in one way or another in this revolutionary work, and where the young men seemed almost without exception to be members of the fighting organizations of the Revolution.

THE ARREST.
From a Russian illustrated post card.

It is especially those villages where the peasants have been beaten by the Cossacks or imprisoned where the feeling runs most high and the action takes the most aggressive and intelligent form. One peasant was enthusiastic over the university education he had gotten in the prisons. Having been arrested for treasonous actions, he must already have appreciated the spirit of the revolution, and he seemed to think that his prison experiences had given him the greatest of all possible privileges—a thoro education in the causes, the principles and in the means of revolution. As some hundreds of thousands of peasants have been under arrest during the past years, it may be seen what a tremendous educating effect their imprisonment must have had. Perhaps a good half of the villages of Russia are in this manner put in touch with the general revolutionary movement.

This is the situation at the present moment. There are also ominous preparations for a far more serious and violent manner of warfare. In several of the leading provinces the villages are making every effort to arm and to train up a secret village militia for future use. In the Government of Saratoff nearly every one of the fifteen hundred villages has its secret committee, and nearly every one of these committees has more or less arms. Some committees are small, consisting of half a dozen members. Others include a hundred or more —all the young men of the village. In some cases there are only a few old revolvers and guns; in others the peasants are provided with modern rifles.

These local committees are all organized under the district committees and the district committees under the committees of the government. The discipline is considerable. When the local committee is considering the advisability of killing some particularly brutal official, overseer or landlord, permission is first asked from the central committee, and then, if this permission is granted, the deed is quietly and effectively executed. The landlords are frightened. It is said that all the estates in this government are for sale except those of the two recent ministers, Durnovo and Akimov.

The revolutionary committee of Saratoff is preparing daily for future needs. The local militia are being secretly drilled, taught how to use their weapons and educated in the art of guerrilla war. All the roads, bridges and railway lines are being studied with the end of accomplishing the destruction of the means of communication in the quickest possible manner when the moment arrives; and, of course, the peasant militia has the fullest assurance of the support of the whole railway union in this plan. Saratoff is the model province of Russia from the standpoint of peasant revolt, but many others, especially among its neighbors and those provinces nearest to the Black Sea, are following Saratoff's example.

Until a few months ago there seemed to be one fatal lack in the revolutionist plan—the means with which to purchase the large supplies of arms that will be needed before this guerrilla war can be put on the same footing that it has reached in the Caucasus and the Baltic Provinces. There are now perhaps a hundred thousand rifles among the revolutionists if we include these outlying parts of the empire. There should be several times that many before the guerrilla war can be successfully begun in the central parts of the country. The money for this purpose was entirely wanting a year ago, but within the past year the well planned and executed robberies of the Government officers and large banks by the revolutionists (the robberies of the private institutions undertaken only, of course, by the most extreme wing) have largely supplied the lack. Approximately some ten million roubles (five million dollars) have been obtained in this way, sufficient, perhaps, to justify the carrying over of the guerrilla war into the heart of rural Russia as soon as the guns have been smuggled over the border or secured by official corruption within the realm.

The peasants are winning their liberty at a terrible cost, of which the blood tribute is the least important factor. All this sacrifice of life, all the misery and hardship that it must entail, are not a very large price for the Russian peasants to pay for emancipation from age-long oppression, famine and misery. The worst part of the situation is the reaction on

their own characters of the violence to which the brutal Government forces the people to resort. When the peasant gets used to killing overseers and police he must have become more or less accustomed to the shedding of blood—as brutalized, perhaps, as soldiers during a war. But he cannot and will not stop there. Already the villager's hand is raised against his fellow villager. The soldiers of brutal regiments are beaten by the villagers when they return home. Peasants that refuse to take part in the general revolutionary movement or strike are beaten or slain.

the lead of this village aristocracy. Between these and the majority of the peasants there is arising the most brutal and terrible war. The victory is not so easily with the majority as it might seem. A strong village policeman and a few well-hidden spies, a detachment of rural guards or Cossacks in the village or near at hand, will give the advantage entirely to the favored few. In such cases some horrible incidents have arisen. The peasant aristocrats, following the illustrious example of the Czar, have instituted so-called military courts for the execution of the leaders of sedition, and have

RUSSIAN REVOLUTIONARY HYMN.
From a Russian illustrated post card.

Even this is not the worst. Some villages may have among them no "traitors" to the Cause; but there is in nearly every village a small class of peasants who have always been and may for some time remain openly loyal to the Czar. These are the privileged—the village usurers, the peasant landlords, the small merchants, the mail carriers, and contractors and others favored by the Government. They are usually only a half dozen or dozen families out of a hundred or two, but they are among the most active of all. Everywhere there are among the families of the common peasants also a few that are inclined to follow

thereupon executed such of their enemies as they could lay their hands on. With others, also emulating the Czar, they have proceeded to apply the well-established custom of the red cock—that is, they have burned down their houses over their heads. But this is a dangerous experiment.

The red cock is the principal weapon of the revolutionary element in the village, and as the property is to a large degree in the hands of the few, they are the principal sufferers in this kind of a war. Such village feuds, resulting in the burning down of the houses of the enemies, and sometimes, by accident, of

neighbors' houses or the whole village as well, have always been frequent. Since the Revolution began it has doubled in intensity, and to the other plagues of Russia—war, famine, pillage and Cossacks—must be added fire. In the short space of a year there were over three thousand such fires in a single government of the fifty of European Russia.

Worse than the public executions in the village and worse than fire is the secret murder by night. Of course, when the war reaches this stage it cannot last long, as the numbers are overwhelmingly on the side of the poverty-stricken many. But the spirit of bloodshed has been turned against neighbors, an infinitely more demoralizing fact than the killing of a stranger landlord or police.

With this loss of regard for life comes an equal disregard of personal property and every other form of personal right. From pillaging the landlords it is a short step to pillaging the rich peasants. The latter reply where they can with a forced confiscation of the weaker peasants' goods. Soon a period of plunder sets in, directed very largely against those with whom the peasants have their scores to settle—that is, the rich peasants, the landlords and the police.

This whole picture of the immediate future of the Russian village is such a terrible one that few large-hearted and cultivated Russians can bear to contemplate it. Many, in revolt against the only picture that accords with their reason, will yet deny some of the most obvious facts. Others, unable to argue away the facts, give up all hope and can see no end to the demoralization once it gains the upper hand. I have been forced to confess, indeed, that the spread and success of the revolution depends probably not so much on its successful organization as on the disorganization of the Government and on the spread of the spirit of rebellion and desperation in the mind of the individual peasants. Evidently individual rebellion is subject to all the limitations of the individual rebel. A growing disregard for life, property, industry and order is inevitable as long as the revolution continues. The powers that are maintaining the Russian Government today can undoubtedly force the nation to this fearful and protracted ordeal. Revolutionary organizations and organized forms of revolt that make against this demoralization it can defeat and destroy. Against millions of individual rebels who, however unorganized, are ready to give up everything for the cause, it can accomplish nothing.

It would be the grossest error to conclude that there is no organization of the revolutionary forces, for there is a constant and often successful effort to create organizations of every kind. It is only that such organizations are only organizations in an educational sense. The personnel of both leaders and rank and file is constantly shifting. Continuous and concerted action is out of the question. They cannot by any possibility rise above the level of the average member—they can only bring backward members to the level.

The peasants' union gathered together in a single program and a single set of revolutionary tactics the best opinion among the Russian radicals as well as the most widely accepted opinions of the peasants. It perfected and developed its program thru repeated national conferences, and it finally succeeded in spreading a knowledge of its tactics in nearly every village of the land. This is organization in the deepest spiritual sense. The central committee was imprisoned; the local committees were exiled; all the most openly active members of the union were beaten or thrown into jail. Yet the idea of the union lives and it unites the peasants in a common effort for a common end. The union remains as popular as ever among the peasantry. Whole villages are still anxious to be admitted to its somewhat mysterious folds. They know its program; they do not and cannot know the personnel of its organization. The intelligent peasants of nearly every village will tell you that they stand for the peasants' union. One peasant summed the matter up in this way:

"Of course, I am for the peasants' union, whatever I may think of other organizations. It is like the hen that spreads its wings over all the smaller revolutionary brood."

After the peasants' union came another organization, equally successful and equally popular. The radical and

revolutionary peasants sent by the villages to represent them in the Duma formed themselves into "the labor group." This group adopted practically the entire program of the peasants' union, and urged the most advanced and democratic demands along every line. It was the members of this group, it will be recalled, that kept themselves in daily touch with the villages all over Russia while the Duma was in session, and who issued, after the Duma was closed, the sensational appeal to arms. This appeal is the most dangerous document to the Government that has ever been published. It has not reached all the villages yet, nor perhaps even a large majority. Moreover, it is so violent and desperate in tone that there are doubtless some villages to whom it would not appeal. However, it has been circulated broadcast, has met with approval in all directions, and in the villages that had received it I found that it had called forth the most cordial and enthusiastic endorsement. The members of the labor group, like the organizers of the peasants' union, are now also in prison or exile; but many are the villagers who have answered the call of the village bell to arms (or rather to sticks and pitchforks) when there has been a need to rally to their defense. Tho known to thousands of peasants and traveling about freely after the Duma was dissolved, many, perhaps, half, of the members of the group were enabled in this way to escape abroad. Their proclamation lives in the peasants' minds, gains ground every day, and may yet serve as a rallying cry for the great revolt.

Thru these organizations, or frameworks of organizations, a very large proportion of the villages have been thoroly ripened and prepared for revolt. Of course the revolt may never occur. It is impossible to say at what time the Government may become sufficiently frightened to make a complete surrender. But the peasants will be satisfied with nothing less than absolute surrender, and the only proposal that has appealed to them so far is that a constitutional assembly be instantly convened. If the Government should not surrender, however, the guerrilla war will soon take a more terrible form.

The country will swarm with an army of guerrilla bands, and the Government authorities will be forced to retire from

A NIGHTMARE

the villages to the strong places the Cossacks are able to hold. The peasants will already have gained part of that for which they are contending. The revolution would have to wait for further success on the capture of some sufficiently important stronghold to serve as a center for an insurrectionary government and for the formation and organization of a regular revolutionary force. Even then the Government armies might be able to put up a terrific resistance.

But whether events ever proceed so far or not, it is the imminent possibility that such a thing may happen that constitutes the hope of the revolution, and the only factor that is able to force from the autocratic Government such fundamental and revolutionary changes as are now absolutely essential to the development of Russia in the minds of every important element of the Russian people.

The Russian people, perhaps more than any other, deplore all warfare. It stands squarely for the abolition of governmental violence in every form. But until the present inhuman despotism is done away with neither war, nor capital punishment, nor imprisonment and exile without trial can be done away with. War is the excuse for the Czarism's existence. Administrative punishment and execution are its sole means of support. It is in a last hope of putting an end, perhaps forever, to war and bloodshed that the people have declared war on the Czarism and are ready to pay in their own blood for victory.

St. Petersburg, Russia.

Old Age: The Epic of a New Year

BY E. P. POWELL

Author of "Old Farm Days," Etc.

"WE go with the years; there is no let up, and, while the new year always turns up with a fresh face, ours grow always a little more wrinkled; and the consciousness increases with us that we are having our days measured off, without the least consideration of our wishes, or consultation as to what we want to do in the way of living." Not quite so, for this affair of old age is getting to be the uppermost topic of the times. It is even getting to be a more interesting question than how to demonstrate a future existence. We mean to realize, at some time, that Biblical forecast which puts "death under foot." We have already succeeded in making old age a new sort of term. Our fathers were bent down at fifty, and a man of seventy was expected to be shriveled and helpless. Machinery has helped to work a change, and a better hygiene has done more. Children can now escape nearly all that round of diseases that went thru the old time district schools; and in this way and in others "visitations of Providence" have lost their power to weaken us before maturity.

How can one become old generously and not let down his vitality till after one hundred years? Can we reach one hundred and fifty years and have them full of strength and pleasure? It is no longer of any use to quote to us that our years are three score and ten by divine decree. Dr. Smith Baker tells us that man grows old more quickly when he fails to keep the balance of his faculties; that a man must keep himself up intellectually and morally in order to be in good physical condition. "A very moral person has a poor lease on life, if his intellectual brightness is allowed to dull." "Keep up with the age in thought, with the times in morals, and see that your body is well groomed, without running away with you." Professional dignity is good so far as it means self-restraint, but it is evil when it becomes a harness; and so he would have our ministers and lawyers and other professionals at home in the athletic field. "Posing with dignity

and failing to feel leg and arm freedom precede atrophy of some muscle or limb."

A very good rule for keeping oneself young is that laid down by an English writer, who says: "I make it a rule to enjoy each step; not merely the getting to the end of my journey—for then I am sure that I will know the flowers along my pathway and will feel the sunshine, and shall even enjoy the grains of sand under my feet as if they were gold." It may be true that there is a certain pleasure of victory on the racecourse, but the athlete is not therefore long lived. He finds no pleasure in the race itself, but in the end of it alone; and our modern training for athletic games I find, as a rule, ends in a smoker if not in a debauch. All the training is thrown away, and most of the good of it is lost. The rule is therefore a very good one to live in each step that we take, and find joy in each act that we perform. Dr. Johnson counted the fence posts for a very good reason; it gave him something to think of while he was walking where nothing else interested him.

We are learning more and more the danger of houses. Live out of doors is the rule for health and long life. For my part I like hammocks and wide verandas and a plenty of balconies, so that not more than one-third of the house shall be inside doors. Then there should be living arbors all about us, and hammocks swung under the pines and spruces and beeches and linden trees, where the shade is good and the air is sweet. The veranda, I am glad to see, is growing in width, and the sun-bath window in popularity. A long walk with more or less muscle exercise—not enough to tire out—should be taken before you take your breakfast, and then again before you take up your pen. One hour is long enough to spend over your books or your writing, and then out of doors again. Never congest your blood. Fifteen minutes at croquet, or a chat with the birds, or kindly exercise in the garden, and then you may go at it for another hour. Two such pulls are enough before dinner. After dinner frolic, laugh, or play, or walk for at least two hours. As you grow older take things a little steadier and easier. Go to your hammock after dinner, and then devote the after half of the day to studying nature at first hand. Above all, never make the blood undertake to digest food and serve the brain at hard thinking at the same time. After the evening meal devote some time to social affairs, and go to your room by 9 o'clock. Do nothing to call the blood to your head, but keep up the sleep habit. Get up early in the morning, certainly by daybreak. Hear the dawn birds, have a bath, and breakfast only on the cream of the day and the top of the morning. Walk a mile or more, by no means on a straight line, but wherever your fancy or duty dictates. Be as boyish as you feel—whistling, shouting and singing. It will hurt nobody, but will do you good. By no means nicotine yourself. You do not wish to look abroad to see God thru tobacco smoke. You will never live rightly until you can find God in the clover fields and the orchards, and comprehend that you are the child of Life. Do your writing mostly out of doors. It is desperately dangerous to work the brain in bad air—especially that furnished by hot air furnaces.

"The smell of the stable is healthy." I think this is not so true as that the atmosphere of healthy, well-groomed animals is full of a clean, wholesome vitality. Grooming them is not only good exercise, but otherwise wholesome. At the same time my "Fanny" is considerable of an intellectual companion. A collie is a healthy companion, and a litter of pups is a never-failing source of jolly life. One should sing with the birds, and get into as close companionship as possible with them. Try it once, and you will be surprised to find how much some of the birds like human sympathy. I find this especially true of catbirds in my Northern home and mocking birds at my Florida home. They get to be peculiarly desirous to please us, coming very close and trying hard to say things. If you talk with them systematically, as if they understood you, they will after a while comprehend your wishes. All sorts of creatures, except the venomous, are likely to be responsive. Talk with everything—your horse, your cow, your dog, your hens—even the toads. They will first show pleasure in hearing you, and then will come love, and life, and joy, till the world around you will be full of vital-

ity, and you will forget all about growing old. Without this, man lives in a receiving vault, hoping for another world, and not knowing enough to live in this world. I am not much interested in the discussion whether animals think or not. I know they do more than that, for they are nearly human in their love and wit. I like to have my hens jump on my shoulders and eat from my hands. But the birds are our most delightful and life-giving companions. You can very quickly establish a friendship with your neighbors in the bushes.

As we get older we get more in need of playmates. That word is just the right one. No one should ever get above or beyond play. It is a panacea for not only children's ills, but the ills of older people. I hope to see the day when we shall have city playgrounds for old folk as well as boys and girls. Judge Geddes showed his color and lost his wrinkles when he played croquet with a half a dozen professors and preachers, whom he induced daily to let up and become boys for a while. When he died we all began to grow older for lack of those frolics. There should be a playground connected with every homestead. My choice would be that the old and the young play together, for if you wish to keep young keep with the young. Never cut loose from the coming-up set. Do not say, "I love children," and then impose on them your senilities. If you cannot be young with them and childlike in your spirit, let them alone. But I am sure that you need not lose your youth. This is not an atmosphere or spirit that belongs to our first twenty years, but is perennial, or it may be so. Life, real life, is never senile, never bloodless, and never played out or used up. If you are dulled, it is because you are half or three-quarters dead; that is, you have let some of your faculties remain unused until they have lost vitality. Boys and girls comprehend the difference quickly. They like life, real living, and they will take to you if you have life. I know people of seventy who catch the eye and the quick response of any school child.

Of course, no one will expect to grow old gracefully in this age without heeding dietetic rules. "Eat more fruit and less meat" seems to sum up the experiments of the more scientific of our advisers. For myself, I do not discard meat altogether; but spending my winters in Florida, where I see meat but once a week, I find no loss from its deprivation, but a decided gain. I walk from five to ten miles a day and do a good deal of garden work, in addition to a full measure of intellectual exercise, without weariness—at least without any wear that is not easily made good. This I cannot do with my Northern diet. In Florida our diet is made up of coarse bread and eggs, with citrus fruits and vegetables—more particularly sweet potatoes dug fresh from the ground. Salads abound, with beans and split peas, but soups are not in favor. Our joints are elastic and our spirits cheerful. Overeating is a pleasant sort of suicide, and I am inclined to think that flesh foods certainly shorten life. When the internal organs give up in despair from overwork the external follow, and we call it paralysis; that is, the blood, trying its best to keep things in order in the stomach, is called suddenly to do a work in the brain, and it goes with a jump—and the man drops down dead. Perhaps he is a distinguished statesman, perhaps only a clodhopper. He could have lived and worked for forty years more, only that when his external organs could not do full duty he undertook to compel his internal organs to do better. There are thousands of people growing old, and older, and dying off on this principle. Two meals a day, mostly of fruits and nuts, would leave most of these people in splendid working order for another quarter of a century or more. There is no use in calling this a fad. Eggs and beans and peas will give you nitrogenous food; and, as you cannot digest more than two meals, why use your life up trying? The stuff must be disposed of some way, or it will poison your blood and clog your system. A supper of baked apples or of oranges or tomatoes will help you get rid of the superfluous; only let them have a chance, and not pile on top a load of Welsh rarebit, with buttered toast and cereals—calling it a light meal. If you could swing a lantern inside you would see that it was not a light matter at all.

I think we older people should have very set and fixed opinions; but that

does not impose a necessity of belaying them into everybody, on all occasions; nor does it hinder our constantly acquiring new knowledge and forming new opinions—and doing it just as frankly as when boys. We are probably no nearer the goal than at thirty or twenty, only maybe we know the route a little better. Why should we not be very positive about some things? And if we handle this knowledge politely we have one of the perquisites of old age, which is respect. That this may deepen very often into love I am sure. Among my best friends, as a boy, were some of my teachers; and now I turn about with a delicious joy in the ardent companionship of many who count their years at one-third of my own. Is there any need that we should misunderstand each other between twenty and seventy? There is a very rapid passing over of acquisition into instinct. I know a steadily increasing number of born evolutionists. These boys do not have to work, as we did, for twenty years, to get a conviction of Darwinism. It is in the air, and it is in the age, and in the age life—which is the womb of the soul. In other words, there is very much less intellectually to separate the old and the young than there used to be, and as a consequence one need not feel as formerly, that he is old—only that he is older, that is, riper, and better entitled to be a little set in some of his notions.

Some one has recently apologized for being a novel reader. I remember that Edward Payson, when preaching at Portland, about a hundred years ago, had hard work to hold his sanctity in public estimation because he read novels. Yet I should say that there is a great deal of good in reading novels, especially for old people and especially for middle-aged people. That will leave the stories for the boys and girls. I read three or four novels a week, sometimes, lying in my hammock—occasionally taking a nap—because they are just as good as going to the city or to the circus, and without the labor of going. They cheer me if bothered, and they break up anxiety; that is, they prevent congestion of the blood and intellectual as well as physical breakdown. I notice that a prominent physician is prescribing them for worry and hypochondria. Modern science has proved accurately that worry will kill. It tells us that worry injures beyond repair certain cells of the brain, and the brain being the nutritive center of the body, other organs are also weakened. It is an irritant poison, and does serious damage even when it is not strong enough to destroy the brain cells. Laughter and good cheer are provocatives of health and defenders of life. One must laugh to be well; heartily, but not necessarily noisily and vacantly.

Do a fair stint and stop, perfectly satisfied. The fret of doing is often a horrible discontent. We hear of the gospel of doing as something over against and greatly better than the gospel of believing. Sometimes this may be so, but I have seen this new gospel wearing people to the bone; driving them into the insanity of restlessness. Professor Tholuck had about the right of it, when, after a hard day's work, he refused to say his prayers at night; only "Lord! You and I are on the same good terms as ever; good night!" This was better than a tired or sleepy devotional exercise. I remember how shocked and pained I once was, in my boyhood, to wake up on my knees. I had knelt at my chair, at family devotions, and gone off in the middle of my father's petitions. Was it not a happy slip, after all, with no harm, but much good, in it? As we grow older I see no need of doing poorer work than when young, but we must not overdo; we must learn the fine art of stopping.

At any rate, do not let us be driven by the cant of progress. Can we keep up, or are we necessarily run away from, by this rattling cart which they call progress? Books, for instance! Why, fifty years ago, a dozen books a year were a good output, where there are now ten thousand. But nature has a happy art that she teaches any intelligent person of absorbing books. As one gets older he goes thru more books in a short space of time, that is, he reads less but absorbs more. An ordinary novel serves for one afternoon, possibly for two; and "Jorn Uhl" or "Lorna Doone" will serve for half a dozen. A magazine is swallowed in one, or, possibly, two hours. This is a process by itself; not exactly

reading, but not inferior to reading. At a glance, the eye and then the mind takes in a whole page. There is less literal memorizing, but more recollection. An essay's contents — its logic, strength, grasp or weakness are caught and held. I do not undertake to say how many words to a page are really read; generally very few. This is mostly a modern attainment, and comes to its perfection in the editor. By and by the process will be abbreviated still farther, and so will be the writing of books. Babes will be born who read at birth, as they now suckle or breathe without instruction. This reading is a stage in an intellectual process. Old age does not need to putter over much of it; we can dispose of as many books now in a year as our fathers could in twenty-five years.

My unshakable conclusion is that elderly people need a great deal more social liberty than they do political or religious. Where we are likely to be fettered and killed off is in performing social functions. The entertainer, you are aware, will cut you, if you decline to spend a fagged hour, after your bedtime, with his guests—not often your friends. Just how much we should yield to this demand is a question; but every one ought to be able in mature life to determine his dues to society, and be allowed to pay them without exhaustion. Old age may be very helpful to the very end socially, but it cannot be a slave without breaking down sharply. For my part I must have my evenings to myself for quiet homefulness. I like my room at eight o'clock and a quiet house. It is not that I am bored with parties; altho they are nuisances as a rule, but simply I do not need them and I cannot afford to indulge in them. A large party is an intellectual and moral bedlam. The amount of small talk is not the worst of it; there is intellectual and moral confusion—no aim, no unity, no end, and no real society. I believe there are a few who like such affairs, or suppose they do. These people grow more and more generalized, until small talk is their fine art, and they have no room for anything larger or higher.

After all, what real social rights have the old? Can we justly create a social life of our own, provided we reach widely enough, and draw into our circle a large number to be benefited? How shall one live so as to be indifferent to social retaliation and slights, so as to go on unruffled and unchanged when overlooked by society lords and madams? I believe the common recipe is to get up a rival "function" and slight the slighter. This only prepares the way for a succession of torts and retorts. I think one may, by building his own life richly and generously, get quite out of reach of these irritants. Still I do not mean to hold that we can ever reach an age where we shall see life adequately alone. It is quite essential to bring together two or three even to find the presence or the best presence of the angels and the saviors. We are all able to take different angles of a truth, and so get pretty nearly around the whole of it. It is important that old and young shall be associated in all the functioning of life. Nature uses us as parts and pieces, and builds her concepts by locking us together. A right sort of life cannot be counted by years, but by its living force. If a man is really vital at eighty or ninety, no one should step on his heels. He has his experiences, but they are not to hang up on the wall like dried herbs. They go on with him, creating a finer manhood and a more generous succulent spirit. Has not the sun got up in the morning these thousands of years; and are not these modern daybreaks as beautiful as those in the days of Homer?

SORRENTO, FLA.

Solving the Railroad Question

BY FRANCIS G. NEWLANDS

United States Senator from Nevada.

THE question of governmental control of railroads was not fully and finally settled in last year's legislation on the subject. Very few expected that it would prove to be satisfactorily adjusted in all respects. It was an effort to cope with many disturbing features and some conditions were improved; but there is abundant evidence that until the system is simplified and unified there will continue to be the cry that the complexity of the situation demands Government ownership as the solution of the problem.

The arguments in favor of Government ownership are attractive and apparently convincing. They tell us that outside the United States three-fifths of the trackage is in national ownership and ask: "Why should not America also own her own railways?" They say: "If the universal tendency is to ownership by nations, why should not we follow their example? If the nation can build the most gigantic work of modern times, the Panama Canal, and if it can own and operate a railroad from ocean to ocean in Panama, why can it not build and own and operate railroads in the United States? If Chicago can contemplate the ownership of interurban railroads costing hundreds of millions, cannot the nation take a hand in the ownership of interstate railroads costing billions?"

Such, in brief, is the argument for the Government ownership of the railroads. The method of accomplishment is not difficult. It would be easy to authorize the Interstate Commerce Commission to institute suit to condemn the shares of stock in all railroads in the country engaged in interstate commerce, leaving the bonds outstanding as a lien upon the property. The interests of the stockholders would thus be purchased by the nation. The Interstate Commerce Commission would step into the position of directors of the various companies, working out a method of national administration. The present bond issue amounts to about six billion dollars, for which Government bonds could gradually be substituted at a saving of interest of about a hundred million annually. The capital stock, which also aggregates about six billion, with a market value a little less, could be condemned at its market value and paid for in United States bonds.

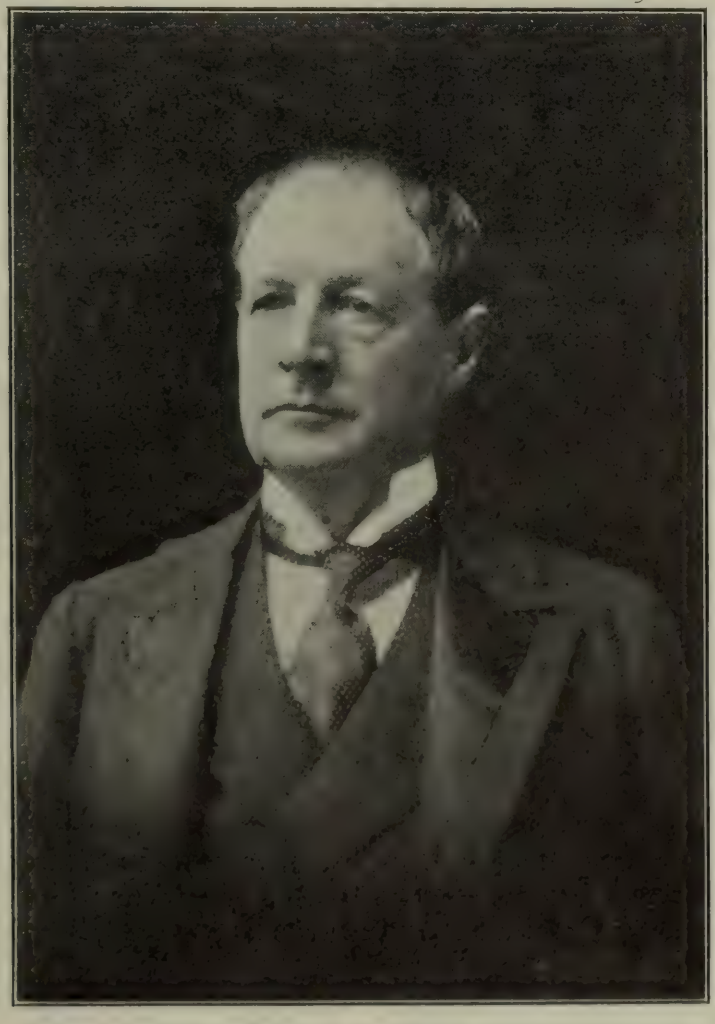
The present annual revenue of the railroads is over two billion dollars, which would amply insure payment of all the fixed charges and interest on the bonds, produce a surplus which would make provision for betterments and extensions and also provide a sinking fund which would extinguish the entire debt in fifty years. There can be no doubt about the legality of the procedure. A similar bill unanimously passed the Senate authorizing the condemnation of the stock of the Panama Railroad. So far as the method is concerned, Government ownership presents no difficulties, either constitutional or practical—except possibly the difficulty of securing honest and efficient administration—and the country will certainly drift toward it unless existing evils are effectually abolished. Even assuming that Government management may not be as economical, the time may yet come when the people

will regard equality of service as of greater importance than economy of service. But while the sentiment in favor of Government ownership is increasing, it is perfectly plain, for other reasons, that the country is not, as yet, prepared for such ownership. Among these reasons a most serious objection is that it would interject a million, three hundred thousand employees into Government patronage and render it difficult to drive from power the party controlling this vast influence, however desirable a change of administration might be.

I believe there is a better policy—a rational middle ground, solving the railroad question, giving the country all of the benefits of Government ownership with none of its dangers; abolishing the evils which have arisen from unrestricted monopoly; automatically bringing about a reduction in rates; putting the railroads out of politics, preventing political patronage for employees and retaining the management of the able men whose genius created our present efficient system of transportation out of the crude conditions which prevailed half a century ago.

The history of the roads, which they have been working out for themselves, suggests it. In 1830 there were 23 miles of railroad in America. In 1905, 213,000 miles. This mileage is owned by over 2,000 railroad corporations created by State laws. As the result of consolidation, combination and recombination, the operation of these 2,000 railroads has been mainly unified under the control of less than ten systems, each organized under the laws of a single State, generally bearing the name of a single man, who is regarded as the dominant factor in its administration. For the machinery of combination the controllers naturally resort to the States whose laws are most lax in proper restrictions as to over-capitalization and other evils.

A railroad, whether in the hands of the Government or of a private corporation, is naturally a monopoly. The steady trend to consolidation is the outcome of economic forces which cannot be controlled or appreciably impeded by legislation. The present system is complicated and expensive, involving the maintenance of many unnecessary corporations, the bond and stock issues of which constitute a mass of perplexing detail, confusing alike to the investor, the tax assessor and the rate regulating commission. It is clear that there should be unity of ownership, recognized by law, of such railroads as are now, with advantage to the public, linked together in interstate commerce regardless of State lines. As State legislation cannot accomplish this the railroad corporations should be national corporations — the creation of the Government whose jurisdiction is as broad as interstate commerce itself, and whose severeignty rests on every foot of American soil.



It must be admitted that for the most part consolidation has thus far resulted in greater economy and efficiency; in better, quicker and more equal service, and in stability of rates. As to whether it has worked any reduction of rates is disputed and whether such combinations are legal is very doubtful since the Northern Securities decision; but consolidation and merger of railroads engaged in interstate commerce constitute a part of the economic development of such commerce.

The activity of these great railroad combinations in politics has been rapidly increasing. They are in politics because they realize that their property may be at any time assailed either by legislatures or by administrative officers. Their vast concerns are between the upper and the nether millstones—the rate-regulating power and the taxing power. Participation in politics is stimulated by the uncertainty and insecurity of their situations. In the States, as a rule, the railroads enter into the elections of officials whose duties are likely to trench in any way upon the taxing or rate regulating power. They are subject to control of Congress in interstate matters and subject to the dictates of forty-five State legislatures or commissions as to State commerce. They are also taxed under forty-five different systems. There is no certainty, no uniformity, no permanency. Therefore the railroads are in politics, and as they do everything systematically, their participation in politics means either organization of or identification with a machine in most of the States. As a matter of business, they naturally

pursue the lines of least resistance, which frequently means alliance with corrupt elements of the communities in which they operate. Once drawn into politics by the necessities of protection, they naturally become aggressive and dominant in political control. It is expensive business for the railroads and it is a grave menace to the institutions of the republic.

For this reason I believe that the railroads themselves, as well as the public, would welcome some efficient simplification which should guarantee their integrity and legitimate business freedom, under established national administration and recognized authority, removing the necessity and temptation for sharp political practices.

It is clear to my mind that this can easily be accomplished by a national law for the incorporation of railways engaged in interstate commerce, subjecting their capitalization, their stock and bond issues and their relations with their employees and the public to the approval and control of the Interstate Commerce Commission. The roads should still be subject to the reasonable police laws of each State in which they are located, but the stocks and bonds of such national corporations should be free from taxation, as representing simply parts of or interests in railroads, which should be assessed and taxed in their entirety. If the whole is taxed, the parts should not be also taxed. The actual property and equipment of such corporations should either be assessed in the State in which they are located at such a percentage of their value as is customary and taxed at the same rate as other property; or better, a regulated tax should be laid upon the gross receipts of the road, and such proportion collected by each State as the gross mileage in the State bears to the entire mileage of the road. A rule of taxation of national instrumentalities by

SENATOR NEWLANDS.

the States could be established by Congress in the case of interstate railroads, as is now done in the case of national banks.

A national incorporation law should limit stock and bond issues to cash paid in, or to the value of property acquired, and no issue of stock or bonds should be legal without the approval of the Commission. There are two States in the Union today whose corporate legislation is of the highest character—the State of Massachusetts and the State of Texas. What we ought to do is to nationalize either the system of Massachusetts or of Texas and denationalize the system of New Jersey. It is possible that we might in some cases have to use the powers both of persuasion and coercion to bring a few of the firmly intrenched corporations out of their shelter and under national charter. It might be, too, that we should have to validate to a large extent overcapitalization already created, but if by this means we can save repetition of the errors in the future we shall be conferring a lasting benefit upon the American people.

The best way to maintain for all time the value of these roads is to have the capital stock express the real capital employed. It will be easy then for the Commission to determine a just return. In fact, this plan, carried out in detail, would mean automatic regulation, so that in a short time the Commission would have hardly anything to do. A limitation on the dividends would enforce not only betterment of the road, but reduction in rates. This is no innovation. When we organized the Union Pacific Railroad we provided that the rates should be diminished after the income reached 10 per cent. In Massachusetts today the limitation upon the return on capital in electric roads, which are being built all over the State, is 6 per cent., with an allowance of one-half of the additional profits to the corporation, the other half to be paid to the State. Nothing has ever been paid to the State; neither, of course, has the corporation received the other half. Beyond the 6 per cent. limit everything has naturally gone to the betterment and extension of the roads and the reduction of rates. The advantage of a limitation of the dividend return on capital is that it works automatically toward betterment of roads, reduction of rates and increase of wages, all of which are public benefits. Otherwise, advantages secured and increase of business tend only to increase the profit of the stockholder. The system which I propose, while securing to the stockholder a fair return for his investment, gives the balance of increasing profit to the public. The system will do away with occasion for irregularities. It will prevent any instigation to illegal practices and will tend directly to improving instead of impoverishing both the service and the country.

No one can doubt the power of the National Government to create corporations for the purpose of carrying out the authority entrusted to it by the Constitution. We have created national banks and have acquired and are now operating the Panama Railroad. We incorporated the Union Pacific, the Atlantic Pacific, the Texas Pacific railroads under the powers granted to Congress by the Constitution to establish post offices and post roads and regulate commerce between the States.

Economic efficiency demands that the same road should accommodate both State and interstate commerce. State commerce is subject to the regulation of the State. Interstate commerce is subject to the regulation of the United States, but when it is all so distinctly for the common good there should be no difficulty concerning the co-operation of the greater and the lesser sovereignties under a national incorporation act.

Whenever the National Government creates a corporation for the carrying out of a great public purpose and when the National Government uses the property of that corporation as an instrumentality for the carrying out of the powers conferred by the Constitution, it can, if it chooses, absolutely exempt such property from State burdens—for the power to tax involves the power to destroy. If it can do this it can certainly lay down the rule by which States shall tax the property of such corporations within their boundaries.

We all know the looseness of State laws regarding the taxation of railroads. The range of assessment is wide, from

the valuation of the tracks and right of way to the combined valuation of all the stocks and bonds, which in most States are also assessed again in the hands of the holders. Being thus subject to the conflicting legislation of forty-five different States, is it to be wondered at that the railroads are well up in political manipulation? Can we throw ten billion dollars' worth of property into the political arena, subject to public control, both as to rates and taxes, and ask that ten billion dollars to keep out of politics?

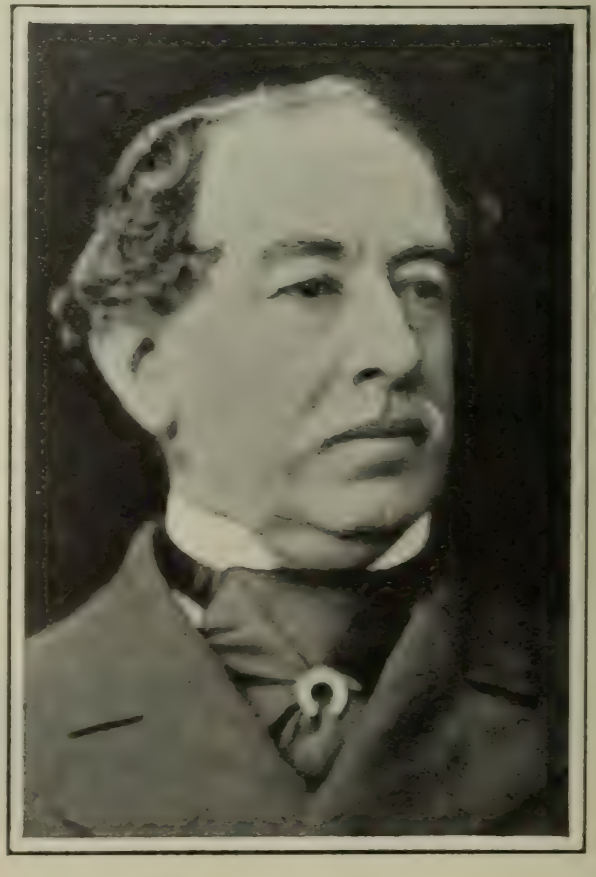
The United States Government should fix a rational and fair rule for the taxation of railroad properties which would leave nothing to discretion, which could be ascertained to mathematical certainty —such as would be the percentage tax on gross receipts, levied by the various States in proportion to their mileage.

There are other provisions which a national incorporation act should contain. One is an insurance and pension fund for employees. One per cent. of the gross receipts of all the railroads of the country would be about $20,000,000 annually. This sum put into a pension fund, invested under the direction of the Secretary of the Treasury, would yield a wide and important benefit. The Interstate Commerce Commission should also be made an effective board of conciliation between employees and railroads to prevent the war which now follows their failure to agree—war which does not involve them only, and to the detriment of both, but which involves the entire country, sometimes threatening the destruction of commerce between States and communities.

Under this plan the vast increase of transportation business thru the future of necessity will tend to the reduction of rates and the advantage of the people. They will feel it in the form of betterments, extensions and improvement in service. They will feel it in improved conditions of employment — higher wages and shorter hours for the million and a half engaged in the railroad industry and a pension fund for sickness and old age. They will feel it in constantly lowering freight rates and passenger rates. To capital it will give security and assured dividends. To labor it will give an impartial tribunal. To the public it will give the lowest rates that are consistent with the highest degree of efficiency born of modern methods. It will bring peace and immunity from agitation and put an end to the continuous warfare which has hitherto existed and still exists in spite of all past legislation, between the railroad and its employees and the railroad and the public.

The plan of Government ownership has its attractiveness of simplicity and directness, but it also has the grave dangers of bureaucracy, unbusinesslike methods, political patronage and many minor objections. The benefits of national ownership can be more successfully secured by the policy of national incorporation and control which possesses the advantages without the dangers. The people demand simplicity in whatever plan is proposed, and unless we unify and simplify the control of transportation in great national corporations whose finances and operations can be easily understood, and whose functions will be entirely taken out of politics, the public will continue to drift with popular agitation toward national ownership as the most easily comprehended solution.

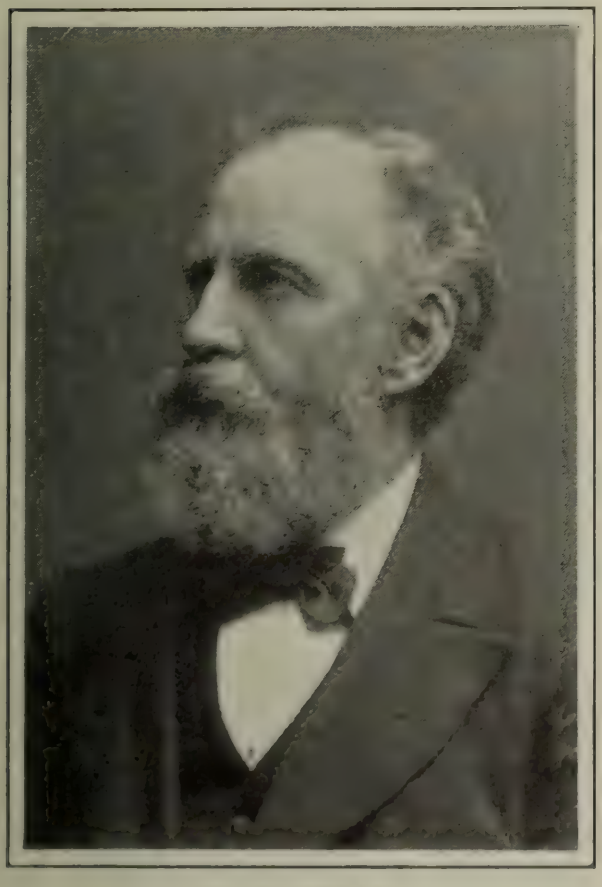
WASHINGTON, D. C.



The Coming of a Fateful Session

BY JUSTIN McCARTHY

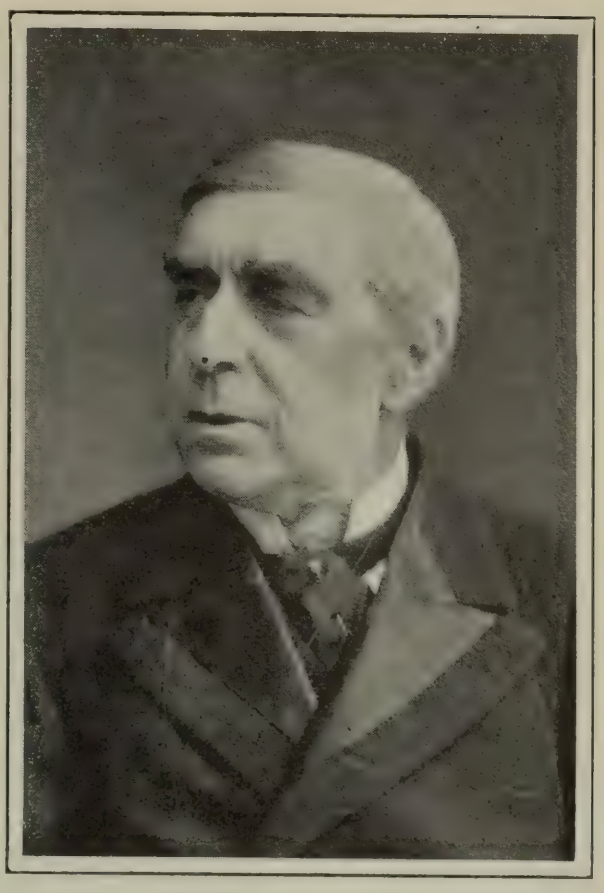
I CANNOT recall to memory any other session of the British Parliament during recent years which opened with so portentous a program—portentous, I mean, in the better omened sense—as that which has just been announced in King Edward's Speech from the Throne. It had indeed been generally understood that the questions indicated in the Royal Speech were to be dealt with in the present or in the next session, but there had been great doubt as to whether the Ministry would make full proclamation of all the new measures which they mean to introduce and of all the great questions with which they propose to deal. There had been, for instance, a very general impression that the Liberal Government would not announce their determination to take some course with regard to the House of Lords, but would wait for the present before pledging themselves to any prompt action on that subject. Now, however, we have the explicit declaration made that Parliament is to be invited at the earliest opportunity to consider the existing state of the arrangements between Lords and Commons, with a view to a satisfactory reconstruction of those arrangements.



The Royal Speech has also declared that His Majesty's Ministers are determined to take, at the earliest possible opporunity, the first step on the path toward a permanent and a prosperous reconstruction of Ireland's system of government. We are also informed that the subject of publicans' licenses is to be dealt with by legislative measures in this session for the purpose of promoting the cause of sobriety in these islands. Many other legislative measures of great importance are promised in the Royal Speech, and there is among these a subject to be entered upon for which common expectation did not look out—the admission of women to a larger share in the administration of municipal affairs. Here, then, we have what seems like a complete revelation of all the important measures which it is the present intention of this bravely reforming administration to offer for the consideration of Parliament. It is not of course, to be supposed that all these questions could be disposed of in a single session, but the important fact is that these are now proclaimed in the Royal Speech as the objects to which the Ministry have determined to devote their energies as reformers.

The subjects to which the attention of the country at large will be chiefly directed are, of course, the need of some constitutional reconstruction of our hereditary chamber which shall prevent it from being what it has so long been—a mere obstruction in the way of all reforming and progressive legislation; the first step toward Home Rule for Ireland, and the alteration of the laws which sanction the unlimited propagation of drunkenness thru the medium of the licensed public houses. The proposals with regard to Ireland will no doubt amount to nothing more than the first step toward the establishment of national

WILLIAM HOWARD RUSSELL.



self-government in Ireland. I do not suppose that it is intended to introduce all at once a system of Home Rule, but it will be at least something to have a measure brought in with the avowed purpose of setting up an entirely new system of rule for Ireland, a system capable of being developed into that form of national self-government which has proved so successful in England's Canadian and Australasian colonies. This would amount to an official proclamation that the present Government recognize the absolute necessity for enabling Ire-

W. T. STEAD.

land to manage her own local affairs, and if the measure should receive the full support of the Irish National Party, that in itself would be the fullest evidence that the immediate measure is avowedly a mere step in the right direction, and not as the final concession to Ireland's national claim. It is certainly not too much to assume that the session which has just opened is destined to mark a new and most important era in our history.

Death has lately been removing some remarkable figures from the fields of

THE RIGHT HON. G. J. GOSCHEN.

English political and literary life. I shall take first in my survey the figure of Lord Goschen, altho he was not the first to pass away from among the living. The political career of Lord Goschen is well known to most of my American readers, and of course, the American daily papers will already have given full accounts of his career, first as an advanced Liberal, then as a Conservative, and more lately as one who showed a certain reaction against Conservatism; as a leading member, first of Liberal, then of Conservative governments, and finally, as a man altogether withdrawn from official life. I shall merely give my own impressions of Lord Goschen, whom I had continued opportunities of observing while he was still in the House of Commons as Mr. Goschen and whom I met occasionally in private life. Goschen was a great financier, a powerful debater, and he was also an intellectual thinker and scholar, with a distinct blending of literary taste, culture and capacity. He could not be called an orator, partly because of his defects in voice and manner, and also because of his lack of that imaginative faculty

which is needed to bring forth genuine eloquence. His manner was awkward, his voice was harsh and dissonant, and he had not more of graceful expression than he had of musical accent. But he was a most effective debater, and when once you began to listen to his speech you found that you could not withdraw your attention from it. He was very short-sighted, and his glasses were often a great trouble to him, sometimes falling from their place and awkwardly interrupting the course of his argument. He was a great reader, and some of his allusions to history and to poetry were most happy, and showed alike appreciation and imagination. He used to say of himself that he had a passion for statistics. The late Herbert Spencer used to say of himself that he had a passion for contradiction, and an author and politician who is still living has said of himself that he has a passion for asking questions. Goschen's passion for statistics found happy and valuable expression in his own budget speeches as Chancellor of the Exchequer and in his criticisms on the budget speeches of other statesmen holding the same office. His name will long be remembered in England's parliamentary history.

The recent death of Miss Helen Taylor aroused a feeling of deep regret among all who had known her or known anything of her. She was not, indeed, a conspicuous figure in England's life, but she was in every sense a most remarkable woman. She was the stepdaughter of John Stuart Mill, and, as we know from Mill's own words, she rendered much valuable assistance to that great thinker, one of England's greatest thinkers, in the production of some of his more recent works. She was, like her stepfather, a devoted advocate of progressive Liberalism, and like him, too, she had a deep and thoro sympathy with Ireland's national cause and with every effort to improve the condition of the Irish agricultural population. Helen Taylor became an active member of the Ladies' Land League, an association formed with the object of lending help to the movement which has already achieved much legislative success for a reform in the barbarous laws that crushed down the cotter-tenantry of Ireland. I had the honor of knowing and of often meeting Helen Taylor, and I had the good fortune to be the means of bringing her and Charles Stewart Parnell into personal acquaintanceship. I had known her stepfather, was indebted to him for much kindness and encouragement, and have laid many a flower-wreath on his grave at Avignon, in France. Helen Taylor was a handsome and stately woman. I had not been in the way of meeting her for several years of the past, but she will always live in my memory and must live in the memory of all who knew her as a noble type of intellectual, public-spirited and beneficent womanhood.

Another name on my present death roll is that of Sir William Howard Russell, the famous war correspondent of the *Times*. The name and the career of Russell are as well known in the United States as in England, and he had acted as *Times* correspondent during the great American Civil War. He had, indeed, been the correspondent of the *Times* during all the remarkable campaigns of his active life in the Crimea, during the Indian Mutiny, and the eventful struggle between France and Prussia, which ended in the fall of Louis Napoleon and the last French Empire. I first saw Russell some years before the Crimean war, and I met him, not on a foreign battlefield, but in the court-house of Clonmel, in Ireland, at the time when the trial of Smith O'Brien, Thomas Francis Meagher and other Irishmen was going on after the unsuccessful Irish insurrection of 1848. I was then but a mere youth, had begun newspaper work on the *Cork Examiner*, and was sent with some others to prepare reports and descriptions of the trial. Russell was even then beginning to be distinguished among men of the journalistic craft, and I can well remember that I regarded him as quite an important personage. Smith O'Brien and Meagher and their companions were found guilty of rebellion, and indeed they frankly owned and gloried in the charge, and they were sentenced to be hanged, drawn and quartered. I heard the sentences passed and so did Howard Russell. The death sentences were, however, commuted by Queen Victoria into transportation for life, and Meagher escaped in 1852 from Van Diemen's

Land and settled in the United States, where in 1861 he organized the Irish Brigade for the defense of the Federal cause and distinguished himself in many of the great battles of those days. William Howard Russell had once again the opportunity of chronicling in the *Times* some events of the career of Meagher. Russell was undoubtedly the greatest war correspondent sent out by an English journal in the days when the correspondence had still to be sent home by means of the ordinary postal delivery and before that modern era when the details of a battle could be flashed along the wires of the telegraph. Archibald Forbes was the greatest of this latter order in those more recent days. It is a somewhat curious fact that the former of those two famous members of the English press was an Irishman and the latter was a Scotchman.

Literature in England has had some remarkable additions made to it within the last few weeks. One of these is a volume bearing the enquiring title of "Peers or People?" published by T. Fisher Unwin, of London. The purpose of this book is clearly and concisely described on its title page by the words "The House of Lords weighed in the balances and found wanting—An Appeal to History." The author is Mr. William T. Stead, one of the best known English journalists of our day, and who has made a name for himself as a most active agitator in educational and other philanthropic schemes for the benefit of the public. He has started newspapers and reviews; has taken part in all manner of enterprises for the common weal according to his own views of right and wrong, and is indeed a born controversialist, while ever a controversialist with some public object in view. The book I am now noticing is, as its title proclaims, a contribution to that great argument which we are all expecting to see brought to a conclusion before long in this country, the question what is to be done with the House of Lords. Mr. Stead is, I need hardly say, a convinced and complete opponent of the House of Lords in its present condition, and he has prepared in this volume a most elaborate and exhaustive account of all the many misdeeds of the hereditary chamber during its more modern existence. No student could have a more minute and circumstantial indictment of the peers as legislators than that which is to be found in the pages of this moderately sized volume. The author's style is clear, vigorous and sparkling, and even those readers who are least inclined to accept all his conclusions must admit that there is something singularly attractive in his animated and very remarkable contribution to a great living controversy.

One of the most delightful volumes given to the reading public for a long time is "The Luck of the Leura," by Mrs. Campbell Praed, and of which John Long, of London, is the publisher. "The Luck of the Leura" is a collection of stories having for their scene some of the outlying regions of Australia—outlying I mean so far as the ordinary European or American tourist in Australia is concerned. This book seems to me the very best of its kind as yet brought out by Mrs. Praed, whose earlier Australian stories have all won so much success. Mrs. Praed has done a service to her readers by prefixing to the first of the stories a vocabulary of Australian expressions, which otherwise would have to be each of them rendered into English on its page in the volume and would probably not be remembered by the reader when he came to meet it again on some farther page. The figures in these stories seems as if they are actually living before us; we are made to see the outlines and the colors of the landscape all around, while the perfumes and the very atmosphere of each different region are real for us as we are led along. The volume is full of humor, and has here and there some passages of an exquisite pathos; there is in it genuine imagination as well as genuine realism, and it is safe to say that no one who opens "The Luck of the Leura" is ever likely to put it away before he has finished its last page, or indeed is ever likely to put it finally away even then. I do not think I am saying too much in praise of this volume when I say that, in my opinion, its artistic place is on a level with Bret Harte's "Wild West" stories, and I do not think that higher commendation could well be given to any such collection of tales.

LONDON, ENGLAND.

The Man, Carducci

BY SALVATORE CORTESI

"Drape the way, thru which the Poet will pass forever, with flags. Have the last Garibaldian bugle sound the air of our national resurrection before his hearse. All the great dead will rise to meet him, for after Garibaldi he was the ideal leader of Italy, planning a new classical future for her. Therefore his death is not the sunset but the sunrise of a people, who reclimb the hill of history to reconquer the supremacy of their ancient genius."

THUS Alfreddo Oriani, the strong and popular writer of Romagna, expressed the national feeling on learning of the death of Giosuè Carducci.

My intention is to give the readers of THE INDEPENDENT an idea of Carducci as a man, for his name as a writer and poet has long ago gone beyond the seas thru his one hundred volumes, each of which would have been enough to make him famous.

Carducci, altho the son of a doctor, was born and remained all his life a plebeian, and at times a rough and uncouth plebeian, but proud and disdainful of everything which was not noble, strong and great. Most of his time was occupied in study, in writing and in lecturing at the university, while he spent also many hours in the shop of his editor among books, MSS. and proofs. He found agreeable ways of employing his leisure, but always refused to have anything to do with society and with modern fashions and entertainments. He detested tea, but liked not one but several glasses of good strong wine, a too liberal taking of this beverage being, indeed, one of the accusations which his adversaries brought against him, as also against Felice Cavallotti, the poet and politician, killed in his thirty-fourth duel. While he was in good health, Carducci might have been seen every afternoon at the café of the Pavaglione, or in some even more modest inn playing *briscola* (a local game of cards), rebelling against any suggestion of exotic games, such as nap or bridge.

His life was certainly not spent in riches. When a boy he was driven from place to place in his native Tuscany by the persecution of his father by the Government, as he participated in political conspiracies, was a member of the secret society, the *Carbonari,* and was condemned to prison. This added ferociousness and violence to his son's temperament, giving him that strong sense of individualism which seemed to make him enjoy being against every one and everything, with a cult for something greater and superior to all. He said: "I have never asked women for love, men for friendship, youth for admiration, journalists for praise, people for votes or ministers for place," and this was strictly true. What he did and accomplished was thru his own exertions and genius. He began his career as professor of rhetoric in the College of San Miniato, at $15.40 a month. After he had been there a year, as was to be expected, the debts at the small inn where he took his meals, and at the café which represented a kind of club, where all the leading people of the place gathered, reached such proportions that to pay them off he decided to publish some of his poems. Thus, in 1857, his first book of "Rimes" saw the light of day. In 1860 Terenzio Marmiani, then Minister of Public In-

struction, appointed him professor of literature at the University of Bologna, which position he never left. From that chair a generation of the youth of Bologna have watched his leonine head, and have been taught, preached at and exhorted, until his health broke down and he resigned "the honor of serving his country," which resignation was, however, not accepted.

Many have depicted Carducci as a stanch monarchist, and just as many others a rabid republican, and both were right, as he has been both. He was a monarchist when all that was alive in the peninsula rallied round the House of Savoy in the supreme struggle for independence and unity, and he was a republican when, after the material unification of the country, he did not think that monarchical institutions were adequate to the situation and would bring about that moral, social, intellectual and economic resurrection which formed his glorious ideal. It was during this stage that he met Queen Margherita for the first time, when she and King Humbert, in 1878, accompanied by Premier Cairoli, the only survivor of the five brothers who gave their lives for their country and King, visited Romagna and Bologna, arousing tremendous enthusiasm. Carducci immediately said that whatever his personal opinions were, his position as professor at the University obliged him to meet the Head of the State together with the other city authorities. However, at the last moment, when he was on the point of solemnly going to kiss the Queen's hand as a "duty," he discovered that he had unconsciously grown so much stouter since purchasing his dress clothes, which he had not worn for years, that he could scarcely get into them, the waistcoat, especially, refusing to button. It was then too late to get another, and in despair the confused poet and professor was squeezed into that of a friend, and thus attired he met Queen Margherita, who later was to prove herself such a good friend. This recalls the plight of King Victor Emanuel whom Carducci admired so much. One evening King Victor Emanuel went to the theater absolutely alone, in a *negligé* jacket. In the middle of the first act what was his horror to see the Russian Empress and her daughter, who were then in Rome, enter an adjacent box. He could not slip away, because they had seen him, and it was equally impossible to go to them in that costume. Suddenly the King has an inspiration, and calling the Prefect of Rome, also present, ordered him to take off his dress coat and give it to him. This the surprised Senator did, even helping the King to put it on, but Victor Emanuel's shoulders were extraordinarily broad, and no sooner had he forced them into the coat than the seam gave way from neck to waist, and affairs were as before. The King was obliged to join the Empress and her daughter in his jacket, but made such good excuses that he was forgiven. A couple of days later the Prefect received the gift of a new dress coat made by the royal tailor, with a diamond pin in one of the lapels.

A few days after Carducci thus saw the Queen he composed an ode entitled "To the Queen of Italy," which is now famous. Before long he was informed that the Civil Order of Savoy was about to be conferred upon him. He wrote at once asking to be dispensed, and when asked the reason answered: "First, because it is a pleasure to me to renounce; then because a pension is attached to the decoration, and I prefer my ideas to any money. Finally, I have learned that I must kneel and take an oath on the Gospels, which nothing would induce me to do!"

During this period of fervent republicanism he went usually in the summer to the Aosta Valley, which, altho Italian, is French in language. Here Queen Margherita came in all the glory of her youth and beauty to be welcomed each year by the Mayor. One year he brought his welcoming speech to Carducci for criticism. "But it is in French," said the stern master. "Why do you not speak in Italian?" "Well, you know, *Maestro*, I am rather uncertain in Italian, and certainly could not write a speech in it. But I tell you what I'll do, you write it and I will learn it off by heart." Carducci refused in most forcible terms to write what would have to be a glorification of royalty, but the idea that his beloved Italian should be

slighted before an Italian Queen, altho he did not acknowledge her, was unbearable, and he consented, with the solemn promise to murder the Mayor if the secret ever came out. The great day arrived, and the Mayor stood up before Her Majesty with Carducci behind him. The grand thoughts and language in which the address was clothed woke the Queen up, who was soon absorbed in what was one of the most beautiful of Carducci's prose harangs, and with it came suspicion, as she was accustomed to his style. She called the Mayor and said she must compliment him on such an eloquent speech, which she had enjoyed exceedingly, but how was it that he spoke in Italian? The Mayor, thoroly flustered, feeling the eyes of the Queen before and the eyes of the poet behind, made an incoherent reply, and nearly sank into the ground when Queen Margherita said suddenly: "Did you write it?" "N-n-o," was the stuttering reply, "it was—Carducci!" which answer ended in an inarticulate squeak, as the poet, who had already understood that his accomplice was about to turn traitor, landed a tremendous kick in the victim's back, just as the word "Carducci" came out. The Queen smiled, looked at the poet, glowering and muttering like a thundercloud, and withdrew. The next day the Mayor's papers were rifled, and the MS. of his speech, written in Carducci's handwriting, disappeared, and has never come to light. Is it a Queen's treasure? Last year, hearing that Carducci had decided to sell his beloved library because he feared to die and leave his family in want, Queen Margherita at once bought it, as also the house in which he lived, leaving him the use of both for life.

Carducci married very young, at twenty-four, and it is not known that he ever loved any other woman, but in his poems he has sung of many ideal women. The personification of one of these is supposed to be Annie Vivanti, who is very much younger than himself, a poetess and a writer for whom Carducci had a kind of paternal and chivalrous affection. In one of her poems she described herself as born in England of a German mother and Italian father, while she eventually married an Englishman who lived in the United States. Years ago she wrote a comedy, "Rosa Azzurra" (Blue Rose), which roused great expectation, especially among the friends of Carducci, who knew of his affection for her and his respect for her work. The poet occupied a most prominent place in the theater, not doubting the success, while instead it was a terrible failure. The public at first kept quiet from compliment to the "Master," as they called him, but at a certain point nothing could restrain their disapproval, which broke out in vigorous whistles and hisses. Carducci, rage incarnate, with congested face, flashing eyes, and hair standing on end, sprang like a lion to the front, and roaring "Cowards! Cowards! Cowards!" disappeared into the night. Those who have forgotten the failure, have never forgotten that incarnation of passion in the figure of man; and this typefies his attitude toward much that came in his way in life.

ROME, ITALY.

Fulfilment

BY GERTRUDE HUNTINGTON McGIFFERT

PASSION—it was rounded
By love's divinity;
Love—its deeps I sounded—
'Twas life's infinity;
Life—'twas ever hounded
By death's finality;
Death—and, lo! 'twas bounded
By God's eternity.

NEW YORK CITY.

Baltimore's Anti-Corporation Mayoralty Candidate

BY DAY ALLEN WILLEY

[In a few weeks now Baltimore elects a new mayor. The interesting campaign which George Stewart Brown is making on an anti-graft and anti-corporation platform is causing no end of uneasiness in both the old parties, for many think he will surely be elected. His interesting political history, as shown in the following article is only another instance of the great awakening to the problems and opportunities of the day on the part of the young men of America. This makes his achievements and aspirations of interest far beyond the city of Baltimore.—EDITOR.]

BACK in the early nineties the professors at Johns Hopkins University had a student who worried them. He had a habit of cutting lectures, running over to Washington and listening to debates in Congress. Hour after hour he followed the discussions in Senate and House, observing the tactics of the leaders and the way in which such men as Tom Reed carried their point even in the face of the majority. To the young Baltimorean the science of politics was far more interesting, perhaps instructive, than the isms and ologies of his daily routine. Receiving his diploma he decided to enter the local arena by running for the humble office of City Councilman in his own ward. To his neighbors and acquaintances, "Stovey" Brown's aspirations were regarded as a good joke. His reputation with them was due to his skill as a player of the national game. His nine was one of the crack amateur clubs of the city. But to show their good nature they gave him enough votes to seat him in the Council.

But he has been there since, and what he has done rather than what he has said has made him a prominent candidate for Mayor—and apparently the favored candidate of the working classes, the "vest pocket" voters and not a few of the regular Democrats, of whom he considers himself one. The fact is that George Stewart Brown has originated and headed a movement which is novel in this conservative Southern city, ruled so many years by strict party vote—a movement based largely on the principles for which such men as Mayor Tom Johnson of Cleveland stand, for Brown makes no bones of his belief in the Johnson ideas of municipal government, tho, when asked to state clearly his position, he asserts he is a party man—but with an independent policy.

The man who bids fair to become the next Mayor of Baltimore, despite the opposition of his party organization and other interests that are bitterly opposing him, is an illustration of how individual example, coupled with energy and honesty, can literally revolutionize politics; for whether he wins or not, Mr. Brown has certainly created an independent movement which in vigor and magnitude is without a parallel in the history of Maryland. The way he has brought it about is worth the telling. Elected to the City Council more in jest than in earnest, he was regarded as a cipher so far as politics was concerned. Few if any of the people in his ward believed that he would be more than a figurehead in the Council chamber, the general expectation being that, with the expiration of his term, he would drop out of public life and public sight. But they were mistaken. He had an idea that the city authorities were all too generous in granting franchises to individuals and corporations for the use of the streets and for other purposes, and he was not backward about getting up and making known his views.

Councilmen more friendly to the corporations and others who wanted franchises were at first astonished that any one should dare to put in a word for the city. Then their astonishment changed to hostility. The result was that Brown has had a fight on his hands ever since he has been in public service. At first

he was ignored; then parliamentary tactics, such as indefinitely postponing his measures, adjourning without voting on them, and other schemes, were resorted to. He was placed on the least important committees. In short, the organizations controlling the Council endeavored to block him in every way possible. Perhaps the opposition of the majority was more effective in bringing him out than a passive resistance would have been, for it evidently aroused the spirit which had made the "Stovey" of the ball nine a leader in catching flies and in hitting "three-baggers." He worked harder than ever in support of his measures and by degrees won some of his associates to his side.

With the beginning of success began the movement to which we have referred. There are two branches of the Council of Baltimore—the First and the Second. Members of the First branch merely represent the wards in which they reside. The Second branch is composed of men, each of whom represents several wards. Brown was elected to the First branch. At the end of the term he decided to run for the Second, which meant that he must get the majority of the votes of six wards, which included a part of the so-called "Silk Stocking" district, a large Hebrew population, and one of the Irish strongholds of the city. Even his close friends shook their heads at the chance, but election night found him a winner by what a ward boss would term a "handsome" majority. Seated in the higher body he waged his campaign more vigorously than before, continuing to adhere strictly to his original principles. Tho he has been opposed by all the influence his enemies could bring to bear, he has been so successful in securing legislation for the benefit of the city that he is admitted to be the main defender of its interests.

One of the results which he accomplished almost single handed was a consideration of the erection of a municipal lighting plant. This acted as a club in forcing the company that had been illuminating the city to reduce its charges over 20 per cent., saving the city $40,000 a year. This ordinance was fought by the lighting company thru its friends in the Council, but was finally adopted as was one giving the city a right to purchase certain street railway lines should it desire to do so. He prevented a railroad syndicate from getting $280,000 of the city sinking funds, which would have been paid to the syndicate had he not amended the ordinance which had been introduced in the Council; while by another measure he forced the principal street railway company to pay $50,000 more annual taxes on its property in a section of the city where it had been operating without the payment of any revenue to the people.

We have merely referred to a part of Mr. Brown's work to show how a man can gain popular support with no other influence than personal honesty and ability. These are the main weapons in his fight. He does not hesitate to say that he has no use for bosses or corporations who enrich themselves at public expense, and he handles them without gloves. Here is what he thinks:

"Our present party organizations, Democratic and Republican, have outlived their day. We want a Democratic organization that stands for Democratic principles instead of private graft to individuals and protection to franchise grabbers. The rank and file of the Democratic party are opposed to the receiving of campaign contributions from those seeking and holding special favors. The people are opposed to the management of the party by a machine whose sole function seems to be to deliver the goods so purchased, by putting in office men who will pay the debt, and thus making the party name a means for the enrichment of the few who control it.

"Freedom from graft involves freedom from the boss—freedom from the influences behind the boss. The boss stands between the public-service corporations and the people. To be free from him we must be free from these corporations. The future progress of our city demands the highest order of efficiency on the part of the officials in charge. They must be more than merely honest—they must be efficient in a broad-minded, constructive way, consistent with the progressive spirit of the times. No people can be truly great who do not build for posterity."

This is the Declaration of Independence on which the man who issued it is conducting the fight. It indicates that he believes bossism and graft are due largely to the relations of corporations to the city government, and that companies which have unlimited franchises to furnish such public necessities as light, water and street railway service menace honest administration. So he is striking at

the root of what he beieves to be the political evil. He has the support of neither the regular Democratic nor the regular Republican party, and he is not assisted by any organization whatever. Unlike some of the candidates, he has no "barrel" to open for the campaign. He has no money to secure patronage, and he has made an enemy of every corporation or individual who might give him their political influence. Therefore it is encouraging to the student of politics to know that merely a man's statements backed up by his deeds, are still sufficient in this country to enable him to run for office without other aid, and to obtain a numerous and important following even in cities where rings have held sway for years.

GEORGE STEWART BROWN.
Photo-Portrait by Janvier.

The character of Baltimore's would-be Mayor is partly disclosed by the bold frankness with which he makes public his ideas and challenges his opponents. The eight years of warfare he has waged in the City Council for what he deems the people's rights have not lessened his eagerness for fighting. Tho often defeated, he has again and again come up to the mark as keen and as alert as when public office was so new as to be an enjoyable novelty.

But politics and perseverance are in the blood of the Brown family, as shown by the career of his grandfather, who served the State of Maryland in various public offices, winning what seemed to be hopeless battles by his tact and determination. When the subject of this sketch decided to defy all traditions and elect himself by his sole efforts, he planned a campaign which was characteristic. Practically every night, clear or stormy, finds him "electioneering." First one part of the city, then another and another are visited, every street and alley being canvassed if necessary. To any one who will listen he tells his tale, saying what he will do if elected. In

one block he may talk to the half dozen loungers at the saloon bar. A few minutes later he is addressing a mother's meeting, a neighborhood improvement association or a ward club, perhaps ringing the door bell of the home of some doubting Thomas. Baltimore has a population of about 650,000, yet in the six months Brown has for working up sentiment in his favor, he calculates to be at least seen if not known by every man who has the right to vote. He believes in working directly, not thru others. With his corn cob pipe gripped between his teeth, his soft gray hat jammed down upon his head, this pale-faced, white-haired, studious-looking youth goes from place to place between dusk and midnight at such a pace as would excite the admiration if not the envy of Roosevelt himself.

Months ago, when his enemies realized that he would seek the office, they laid their plans to thwart him and check his effort where possible. The Democratic "machine" in Baltimore is an admirable piece of mechanism, whose well-oiled wheels revolve silently but steadily in every part of the city. Brown has not only "run up" against it, but against other obstacles purposely put in his way by the corporations who depend on the city's money for their revenue. Yet practically single-handed he has made such progress that, as already stated, he has become enlarged in the public eye from the most insignificant to the strongest candidate. In short, he has put in motion one of those indefinable movements of the masses that have made such cities as Cleveland, Toledo and Milwaukee famous—an uprising of the taxpayers independent of party, and their determination to put into office the man of their choice, not one who is forced upon them.

BALTIMORE, MD.

The Approaching National Peace and Arbitration Congress

BY HAMILTON HOLT

ON June 15th there will assemble at The Hague the second Congress of the World. The Czar's rescript calling together the first Hague Conference was given only to those twenty-six nations which had diplomatic representatives at St. Petersburg. At this coming Conference every one of the forty-five nations of the globe will be present, and for the first time in the annals of history all the peoples of the earth will assemble together to discuss the affairs common to all. The second Hague Conference ought to be the greatest political event that has ever taken place.

A few months before the first Conference assembled THE INDEPENDENT published an article from the pen of Elizabeth Stuart Phelps appealing to our nation and to the world to take some adequate interest in it. As far as I know, this was the only appeal in a popular magazine that seemed to appreciate the great possibilities in the first Hague Conference. The world at large looked upon the Czar's proposition as a pious dream of a weak sentimentalist, but the time was ripe, and The Hague Court was born which we now know is destined to take the same place among the "United Nations" that our Supreme Court does among the "United States." In other words, by the establishment of The Hague Court, the first Hague Conference took the first step in politically organizing the nations of the world.

Emanuel Kant, one of the greatest intellects the world has produced, says in his essay on "Eternal Peace" that war will not cease until the world is organized, and the world cannot be safely organized until the majority of the nations have representative governments. The greatest international problem before the world, therefore, is; how can the

forthcoming Hague Conference take the next great step toward world organization? We already have The Hague or Supreme Court of the world. The next logical step is an international legislature.

The peace movement is no longer in the dreams of seers and prophets, philosophers and poets. Since the first Hague Conference it has become a practical political issue—*the* practical issue before the statesmen of the world. The Interparliamentary Union, which is composed of 2,500 members of the 15,000 members who sit in national parliaments, has advocated, and the nations have agreed, that the second Hague Conference take up these four propositions for its chief discussion: *First,* that the Congress assemble hereafter *automatically* and *periodically; second,* that a model arbitration treaty be drawn; *third,* that the question of disarmament be discussed, and, *fourth,* that contraband of war be defined.

But disarmament cannot logically precede political organization, for until the world is politically organized there is no way, except by force of arms, by which a nation can assure its rights in that common international realm in which all nations are equally sovereign. The drafting of a model arbitration treaty, much as it is desired, is little more than a counsel of perfection. Such a treaty is not self-operative, and will not bring about peace any more than the model charter drafted by the National Municipal League will of its own force inaugurate good government in our cities. The same line of reasoning applies to the drafting of a definition of contraband of war. Clearly, then, the predominant issue at the next Conference is the proposition that the Conference hereafter assemble periodically and automatically, and not at the call of some sovereign or monarch. For even if at first such a periodical and automatic Congress can do no more than express pious resolutions, as time goes on it will be given more and more power, just as in the future The Hague Court will be given more and more jurisdiction. Finally, an international executive will be added, and then all questions of an international nature will be discussed, decided and enforced according to law, and we shall have in very truth the Americanization of the world.

Before the first Conference assembled, the so-called practical people took no interest in it, but since then there have sprung up numerous individuals and associations thruout Christendom who are bringing public opinion to bear on the various governments, so that the forthcoming Conference may take a long step forward beyond the first Conference. In this country by far the largest conference will be held in New York City from April 14th to April 17th. This will be the most important gathering ever held in this country in the interests of peace, and one of the most important ever held here for any purpose whatsoever. This Conference is not in charge of the professional peace people, but will be thoroly representative in character. The president is Mr. Andrew Carnegie, and the vice-presidents include Governor Hughes of New York, Justice Brewer, Andrew D. White, Congressman Bartholdt, ex-Mayor Low, Albert K. Smiley, Judge George Gray, Samuel Gompers, Morris K. Jesup and John Mitchell. The chairman of the executive committee is Prof. Samuel T. Dutton, the treasurer is George Foster Peabody, and the secretary is Robert E. Ely. Various subcommittees are already at work, and they include the leading men in the United States in their respective fields. The legislative committee will see that the Governors of every State, the members of Congress and the leading publicists of the country are invited to the Conference. The judicial committee will invite all the leading Federal and State judges of the land. The press committee, which is composed of representatives of sixty of the leading daily, weekly and monthly papers of New York, will invite every editor in the United States to be present, the circulation of whose paper runs over 5,000. There are equally large and influential committees representing chambers of commerce, boards of trade and transportation, merchants' associations, labor organizations, patriotic societies, women's clubs, schools and colleges, churches and ethical societies, etc.

It is fortunate that at the time of this Conference there will be in America a

body of distinguished foreigners from various European countries, who are to attend the dedication of the Carnegie Institute, at Pittsburg, on April 11th, as guests of Mr. Carnegie. All of these foreign visitors, some twenty or thirty in number, are to attend the Conference and participate in its deliberations. Among the speakers already pledged to address one or more meetings of the congress are two of President Roosevelt's Cabinet—Elihu Root and Oscar S. Straus; Governor Hughes, Mr. Bartholdt, Judge Gray, Mr. Bryan, Seth Low, Archbishop Farley, Bishop Potter, Rabbi Hirsch, Miss Jane Addams, President Nicholas Murray Butler, Baron d'Estournelles, James Bryce, Mrs. Julia Ward Howe, Samuel Gompers, W. T. Stead, etc. In short, both in distinction of speakers and quality of delegates there could scarcely be got together a more eminent body of men in the whole of America.

The Conference will culminate Wednesday night with a dinner at which over 1,000 guests are expected to be present. Mr. Carnegie will preside, and President Roosevelt, President Diaz of Mexico, Lord Gray, Governor-General of Canada, and half a dozen others, have been invited to speak. President Roosevelt has not yet accepted the invitation, but there is every probability that he will be able to do so.

At all these meetings some of the leading musical organizations of America will take part, and the New York clubs are expected to give numerous receptions to the various delegates. The attendance of the congress is expected to be very large, so that it is important for those who wish to be present to signify their intention without delay. The meetings will be open to the public, but a ticket entitling a person to a reserved seat in the hall thruout the whole congress may be obtained from Robert E. Ely, secretary, at 23 West Forty-fourth street, New York City, for the nominal sum of one dollar. The hotels in New York and the railroads are already offering reduced rates for the Conference.

This Conference can scarcely fail to produce a profound effect not only on the administration at Washington, but on the nation and the whole world. If any of the readers of THE INDEPENDENT cannot attend this Conference and want to help along this great peace movement in some practical way, when the next Hague Conference is in session in the middle of June, let them get their political and social clubs or their churches to pass resolutions in favor of the substitution of law for war, and cable them to the American delegates at The Hague. Mr. Andrew D. White, president of the American delegation at the first Hague Conference, said that it was literally the bushels of letters and cablegrams that were sent from America by individuals and societies at a critical moment when everything seemed dark, that changed despair into hope and ultimately had great weight in bringing forth The Hague Court.

Thus, if the United States of America can cause the next Conference to create an international parliament, in another decade or so the time will be ripe to establish an international executive; and then at last we shall have Tennyson's dream of "The Parliament of Man, the Federation of the World," and for the first time since the Prince of Peace walked on earth it will be possible to have "Peace on earth and good will toward men."

NEW YORK CITY.

Literature

Civil War Books

WRITTEN in Carlylese, but yet a book of uncommon power, is Mr. Snider's *The American Ten Years' War.*[1] We could wish for much less "Will of the People," "Spirit of total Man," "Soul of all Time," and other capitalized abstractions, and we should feel more comfortable in following the single tense of past time than in being jostled about among all the tenses given in the grammars. But for all that the book reveals close study, a fundamental grasp of causes and relations, and a true sense of perspective. The factors making for the great struggle are keenly apprehended, and the salient phases of the preliminary maneuvers are graphically set before us.

Mr. Snider begins with Kansas, for it was there that the first overt acts in the fratricidal drama were committed; and it is the invasion by the Missourians, 5,000 strong, in March, 1855, that he takes as his definite starting point. From the bloody turmoil of the Kansas war he passes over to the larger theater of operations in the nation, and shows us the shifting alignment of men, both as to measures and to parties, which finally arrayed North and South in two hostile sections.

It is perhaps in his treatment of the Southern oligarchy that he is at his best. The number of actual slave-owners in 1850, according to Helper, was but 186,551. The entire number of owners and hirers of slaves, according to the census of 1850, was 347,525. Of these, 174,053 owned or hired from one to four slaves, and about 165,000 owned or hired from five to forty-nine slaves. The remainder, some 8,000, were the great slaveholders, and comprised the Southern oligarchy. Their economic interests were in some measure opposed to those of the small slaveholders, and fundamentally opposed to those of the non-slaveholders. Yet, in spite of this antagonism of interests, this petty group swayed the South for decades, cajoled their exploited victims into acquiescence and finally into secession and warfare. It is a miracle of history which has never received the attention it deserves.

Mr. Snider explains pithily the methods of the process. The members of the oligarchy, thru sheer necessity, were trained to rule, and all the arts of social control were developed by them to an extraordinary degree. They exploited the inferior classes unmercifully, both economically and politically, keeping them in ignorance and privation. Yet with a rare diplomacy they were able to play upon the resentment of their victims toward slavery the institution, and to divert it to a resentment toward the slave. The present day contempt of the poor white for the black is no doubt largely explainable as a survival of this shrewdly fostered feeling of ante-bellum days. No one interested in the phenomena of social control should neglect to read these illuminative and instructive chapters.

Mr. Hall has something of the same story to tell in his *The Rending of Virginia.*[2] The conflicting material interests of the two sections of the Old Dominion are forcibly shown, and a strong light is thrown upon the dominancy of the slave-holding oligarchy. It is interesting to note by how many means, legislative and otherwise, the oligarchy sought to strengthen its grip upon wealth and power. It had all the "selfishness and blindness . . . inherent in autocratic communities." Until the convention of 1850-51 the suffrage was limited to landholders. Representation in the State Legislature was based, as in the Federal Constitution, upon the population, each black counting as three-fifths of a person. In 1850 the concession was made of a representation based on the number of white persons, but this applied only to the lower house. As for the upper house, the representation based on the 486,116 slaves (1860) in Eastern Virginia, virtually neutralized

the representation of the 334,921 whites in Western Virginia.

The oligarchy also took pains to have the burden of taxation fall on the non-slaveholders. Slave property in Virginia in 1860 was valued at about $234,000,000. At the assessment rate paid upon real estate this property should have brought to the State some $937,000 yearly. Thru statutory exemptions and reduced valuations, however, it brought in only about $326,000. Mercantile businesses were taxed by means of licenses, and taxes were even levied upon wages. There were few or no schools available to other than children of the rich, and what internal improvements were voted were generally in the interest of the slave power. All of the fatuity which carries a ruling class to its ruin was strikingly exemplified by the slave-holding class of Virginia. It is small wonder that when the Richmond convention voted for secession the response of the Western Virginians, for the most part a non-slaveholding people, should have been so prompt and decisive for union with the North.

Mr. (or is it Lieutenant?) Munson tells in a spirited and captivating way the story of *Mosby's Guerrillas*.[3] It is hardly history that he gives, but rather adventure with a historic setting. Or if it be called history, it must be classified as of that specialized type produced south of Mason and Dixon's line among a people imaginative and emotional, but not analytical or introspective. There is always the mention of the "overwhelming odds" against which the guerrillas fought—not too exultantly told, but perhaps only as a matter of record. And then there are modest recitals such as this: "I believe, without bragging at the expense of truth, that we saw the back seams of the enemy's jackets oftener than they saw ours." A humorous sidelight is thrown on the author's failing in the matter of judging numbers in his account of his capture. "About twenty men," he records as taking part in the proceeding. But one of his Northern captors writes him: "You overrated the number of men who captured you; there were only a few of us." Whereupon Mr. Munson comments: "I . . . told him my mental condition was such . . . that I could imagine his whole regiment had a hand in the affair." Such candor is pleasant to know; and it could be wished that an equal consciousness of a tendency to magnify the numbers of an enemy and minimize those of one's own forces had been possessed by all Southern writers when relating their Civil War experiences. Mr. Munson stoutly maintains the legitimacy of Mosby's warfare, and gives much testimony tending to prove it. He declares:

"Mosby's Guerrillas were not highwaymen, bushwackers or ruffians, and . . . They did not war upon any element other than that commonly recognized as the enemy. A very large percentage of them were well bred, refined gentlemen."

More anecdotal in manner, tho of the same general nature, is Mr. Alexander's *Mosby's Men*.[4] It is interesting to note some of the contradictions in the two volumes. The accounts of the Greenback raid (October 13th, 1864) differ in a number of important particulars. Was the Federal train deliberately derailed, at the risk of the lives of non-combatants, or was it simply "held up?" Munson says the former, Alexander the latter. The rather common use of carbines in Mosby's command is frequently mentioned by Alexander, but Munson reiterates that only an exceptional instance was known. There is a direct contradiction of a very serious nature in the accounts of the brutal murder of the Federal Lieutenant Cole, after the Blazer fight (November, 1864). Cole had surrendered, when Puryear, a Mosby

From London's "Before Adam."

Ranger, who had previously been a prisoner of the Federals, galloped up and charged the lieutenant with having maltreated him while in captivity. The charge was "admitted by Cole," says Munson (p. 123). Alexander, who was an eye-witness, says (p. 126): "There was a moment's hesitation, *and no response;* then the crack of a pistol." Cole fell and died almost immediately. Munson indulges in some maudlin sentimentality in the matter, but Alexander, a more matter-of-fact narrator, dismisses the matter without comment on the morality of the deed.

Mr. Knauss is a Union veteran. In 1893, while living at Columbus, Ohio, he was forcibly impressed by the "unutterable loveliness and shameful disorder of Camp Chase Cemetery," west of the city, where more than 2,000 Confederate dead are buried. Altho Governors Hayes and Foraker had done something toward keeping the cemetery cleared, their work had gone for naught, and the graveyard had become a wild bramble patch. Mr. Knauss at once set about the task of interesting North and South in the needed work of keeping the place in order. Since 1895 annual commemorative exercises have been held, sometimes attended by large delegations from the South. The cemetery has been thoroly cleared, headstones have been restored, and a beautiful memorial arch has been erected. All the available data regarding the Camp Chase prison and cemetery, including a list of the dead, accounts of the memorial services and statements by former prisoners are given in Mr. Knauss's book.[5] The author has given his later years devotedly to this noble work, and has contributed in no small degree to the restoration of good feeling between the once hostile sections.

Mrs. Maffitt relates the life of her husband,[6] naval officer and one-time commander of the C. S. N. "Florida" and of the ram "Albemarle." Maffitt was a North Carolinian by residence. He entered the old navy, and served on the frigates "St. Louis," "Vandalia," "Macedonian" and "Constitution." At the outbreak of the Civil War he resigned his commission and entered the Confederate service. As the commander of the "Florida" he inflicted vast damage on the merchant marine of the North. His command of the "Albemarle" was brief, and terminated some time before the dramatic sinking of that vessel by Lieutenant Cushing. Maffitt died on May 15th, 1886. A handsome tribute to his character and attainments, from Admiral Daniel D. Porter's "The Naval History of the Civil War" is quoted at length.

Dr. Mudd[7] was one of the alleged conspirators implicated in the assassination of Lincoln. He was sentenced to life imprisonment. He was confined on the Dry Tortugas from July 24th, 1865, to March 8th, 1869, and was then released by an executive order of President Johnson, issued just before his retirement from the Presidency. Dr. Mudd was a slave-owner and a sympathizer with the South. He was slightly acquainted with Booth and well acquainted with Surratt, another alleged conspirator. But a growing conviction of his innocence of any complicity in the plot raised up champions in his behalf, and their constant efforts were finally successful. The argument before the Military Commission of General Thomas Ewing, the formal statements of Dr.

Mudd, Mrs. Mudd and Edward Spangler, another of the number of persons convicted of the crime, are given in full, along with letters written by Dr. Mudd from his island prison.

The Sixteenth Regiment of New York Infantry, whose career is described by General Curtis in *From Bull Run to Chancellorsville,*[8] was the senior regiment of Franklin's division. It was composed of two-year men, and served from the call for volunteers in 1861 until it was mustered out in May, 1863. In two months after this time, more than six hundred of its officers and men were again in the field, "for three years or the war." The record of the regiment itself was highly creditable, and is worthy of independent treatment. General Curtis does more than tell the story of the single regiment. In a way, the volume is a history of the whole war, so long as the regiment lasted, and as far as it was at all concerned. The Army of the Potomac, to which the Sixteenth was attached, finds prominent place in the pages of the book. The author has drawn heavily upon his own recollection, supplementing the same with study of the Rebellion records and communication with his comrades. He has been fairly successful in tracing the later lives of the members of the regiment, and has gathered from them, and from their letters home, many of his details and anecdotes. In its human interest, a volume like this finds its value and its justification. We do not find in it any great addition to our knowledge of the war in general, or even of particular portions of it. The ascertained facts already published are well in excess of anything which recollection is now likely to add. But the narrative of a participant is always of interest, and has, as this history now, an inspiration for the reader that scientific history can rarely offer.

Major Burrage's book, entitled *Gettysburg and Lincoln,*[9] is of an entirely different type. His interest centers in the Gettysburg address, and branches out to the battlefield which made necessary the national cemetery, at whose dedication the speech was delivered.

The first part of *Gettysburg and Lincoln* is devoted to an account of the battle, which is clear enough, but overloaded with names. A few references to the Records and other published aids show that the study is careful; but it has no special contribution, and is simply a utilitarian introduction to the rest of the volume.

In the second part the author deals with the idea of a National Cemetery, which developed into the memorial services of November, 1863. He seems to have made clear the fact that Lincoln's speech was prepared, in greater part, at Washington—if such fact is of any consequence. His description of the ceremony at the battlefield does not seem to be any more graphic than others which we have read. In his third part he goes on into the work of the Gettysburg Battlefield Memorial Association and the erection of the National Park.

Evolutionary Fiction

Mr. Jack London, who has been quite busy recently explaining what, in his opinion, plagiarism is *not,* gives us in *Before Adam*[1] a labored product of his inventiveness, rather than a felicitous work of the imagination. The story fails to make a distinct impression upon the reader, who finds in it, in the last analysis, but another animal story of the type that has been so popular during the last decade or so, a hybrid thing of human psychology and lower animal life. It is all according to the theories of evolution, no doubt, and according to paleontological evidence as well, even unto the facial angle and the saber-tooth tiger, but the mixture of man and gorilla, the confused dream glimpses of a twentieth-century mind of its prehistoric existence as an *Anthropos alogos,* fail to appeal, much less to convince, or even to interest very vividly. Still, it is decidedly ingenious, this story of tree dwellers, cave dwellers and fire makers, who are masters also of the bow and

arrow—of three stages of human evolution going on side by side in a remote geological age. Mr. Charles Livingston Bull's illustrations add to the reader's visual confusion. On the whole, however, he has clung to the gorilla type.

The book suggests inevitably comparison with some earlier ventures in the same field, and the result is not in its favor. Mr. Stanley Waterloo has already spoken for himself and his *Story of Ab;*[2] there is, however, in existence a tale of prehistoric human life better than either, Mr. Gouverneur Morris's *The Pagan's Progress,*[3] which adds to all Mr. London's fidelity to scientific opinion and discovery something that his story lacks, namely, a splendid imagination that rises occasionally to notable hights. This book failed at the time of its publication, a couple of years ago, to receive the recognition it so fully deserves; it is, therefore, recommended here to those curious of this sort of fiction as decidedly well worth their while. Finally there comes to memory, from the long ago, a delicious *jeu d'esprit,* without pretense to scientific accuracy or serious purpose, *Zit and Xoe,*[4] an anonymous little story published in 1889, in which the first tailless man child is driven from the parent nest as an unworthy offspring, the Adam of evolution going forth into the wilderness to find his Eve. And this whimsical story of our remotest ancestors we like best of all.

The Breath of the Runners. By Mary Mears. New York: Frederick Stokes & Co. $1.50.

The first thing one notes of *The Breath of the Runners* is that it is in no wise in the American tradition. First of all, the attitude toward art is that of reverence and almost passionate adoration, the attitude of feeling that to draw a line, to create a visible image in the world, is a motive as forceful as religion or love. The desire for fuller consciousness and consciousness resulting in concrete form is the basis for all the activity in the book. This represents, of course, not an elementary stage of civilization, in which the first striving is for existence, then for comfort, and finally wealth and power. But to place above all these the creative act which shall produce spontaneous joy in other men is a later stage, and a stage that presupposes a previous experience of disillusion with mere comfort and convention. Secondly, this novel is not in the American tradition because it is not sophisticated. Strangely enough, our land, which is the youngest settlement on the globe, has produced a body of literature tainted with sophistication, and slight importance because of that sophistication. Our authors have the manner of presenting us fiction while they say: "See, these are the little human events I choose to throw out for your delectation; humorous, isn't it? I myself stand off and realize how slight and unimportant it all is; I do it purely for your diversion, dear reader, and my own, but Heaven forbid that I should be seriously concerned about so slight a matter." Now, this is eminently sophisticated; it is cautious and canny; it allows for the natural human dislike of a person who takes himself seriously as one who should say, "I know something, or I have felt something, more than another." But great art and great virtue are ever essentially childlike. The highest reach is that which receives the aged and eternally repeated experiences of life as new each day, significant as tho they had never happened before. It is evident, too, that the author has striven, in the use of words and in sentence cadence, for somewhat of the vague and emotional effect of music; the recurring refrain of the shoes, the image under which the panting effort for progress is symbolized, is a purely musical device. Not only the structure, but the evident feeling for diction, the sense that the given word is addressed not entirely to the understanding, but equally to the subconscious emotional nature of the reader, leads one to believe this young author has founded her method upon French psychological fiction, rather than upon our American thin and meager realism. It is, therefore, with deep interest that we look forward to the career of a young writer

[2] The Story of Ab. *By Stanley Waterloo.* New York: Doubleday, Page & Co. $1.50.
[3] The Pagan's Progress. *By Gouverneur Morris.* New York: A. S. Barnes & Co. $1.00.
[4] Zit and Xoe. New York: Harper Brothers. 25 cents.

who, whether she succeed or fail, has set herself the higher and the harder task.

Literary Notes.

....*Peer Gynt,* which Mansfield is now playing in New York City for the first time, is published by Scribners as Vol. IV of their new edition of the collected works of Ibsen. The stage production, tho interesting and beautiful, is necessarily cut so much that the real meaning of the poem cannot be understood without a reading of the complete text. Vol. III of the same edition, containing the complemental drama, *Brand,* has recently appeared. ($1.00 each.)

....In spite of our multitudinous editions of Shakespeare, Professor Neilson's one volume, *Shakespeare's Complete Works,* in the Cambridge edition (Houghton, Mifflin & Co.), is still an event in the scholarly world. In completeness and in cheapness (the price is $3.00) it commends itself to the reader of moderate means and limited book space. If the thin paper, the small type, the double columns, and scant margins check the ardor of those who love beautiful typography, these are at most the defects of the book's qualities. Moreover, it is primarily a scholar's as well as a mere reader's Shakespeare, a volume for reference and for comparison. The text is the result of an exhaustive comparative study of the Quarto and First Folio editions, not neglecting the research of eminent modern editors. In the matter of stage directions, the Elizabethan habit, so fundamentally different from our own, is made conspicuous to the eye by enclosing all directions later than 1623 editions in brackets. For example, Shakespeare did not shift scenery, having no scenery to shift; therefore all such directions as (Olivia's Garden), (Friar Lawrence's Cell) are modern, and are so indicated; and again, "Enter the Jew" (Shylock), Salarino, etc. By this method we are not impoverished (as the manner of Ben Greet is), but retain the modern advantage, and add to it a historic light on the original composition. The only instance in which Professor Neilson has not been conservative is in the matter of punctuation. Heretofore we have had either the meaningless punctuation of early editions or the inconsistencies of the eighteenth century editors, but here at last we have, thruout, careful punctuation in accordance with modern usage.

Pebbles

Editorials

Novel Vacations

FRANK R. STOCKTON tells of a man whose chief enjoyment during his trip abroad was in thinking what a pleasure he could give his friends by telling them all about it, but when he got home he found that they would not listen to him, each preferring instead to talk of his own humdrum affairs. As a last resort he was obliged to hire as an "understudy" an intelligent and appreciative gentleman who, at so much an hour, was willing to listen to the traveler's tales. No doubt many of our readers have suffered in a similar way from lack of appreciative friends. We have a remedy for this evil to propose, which is that we listen to each other's vacation stories. We have been accustomed to secure for our annual Vacation Number articles by professional hunters, travelers and sportsmen, and by men distinguished in other vocations, who would tell us of their avocations, but it has occurred to us that many of our undistinguished readers may have had quite as novel vacation experiences and could tell of them in quite as interesting a way. So we have decided to place a large part of the space of our next Vacation Number, that of June 6th, 1907, at the disposal of our readers, and we invite them to contribute to it whatever will make it interesting or valuable. If our readers take half as much interest in vacations as they do in heretics we are sure of getting some letters well worth reading.

We are unwilling to give more definite specifications, because we want the contributions to have a wide range and to be such articles as it would not come into the editorial mind to order. A vacation is an invitation to break the bonds of habit and to escape from the prison of convention. The Vacation Number should certainly be characterized by this vacation spirit in being as unlike the ordinary issues as possible. During most of the year people are fitted pretty tightly into their niches; it is only when they are released from daily duties and their position in society that they have a chance to develop their individuality if they can, and to manifest their originality if they have any left. Now, what we want to do is to get some of this individuality and originality transferred to the pages of THE INDEPENDENT. We have before us on the table a bright green flowery cover bearing the date "June 6th, 1907." The next thing is to fill it with suitable material.

No doubt you who are reading this now have had some outing experience which you can talk about most interestingly, and if we could pay you an editorial call in person with a stenographer concealed behind the door we could get some good unconventional "copy." But this, tho pleasant for us, would take too long and involve too much traveling to be practicable, so we are obliged to ask you to write it out just as you would tell it to us. You can tell of travels in far countries or in undiscovered countries near at hand, of your adventures by land or on the sea, or—we now must add—in the air; of how you saved money and how you spent it; of your favorite sports or why you detest all sports; of the good times you have had or the most disagreeable experiences, no matter which, they will be equally pleasant reading; of camping tricks and woodcraft; of your own observations of animals and birds at home; of the places you think we ought to visit and the things we ought to do, or of the places and things for us to avoid; and, what would be perhaps as generally useful as anything, of how to be happy if one cannot get a vacation.

If you have a photograph to send with it so much the better; sharp contrasting photographs, tho, not the flat, fuzzy ones. Do not write more than 500 words, and if you make it 300 it will stand a better chance of acceptance. And do not think that you must tell about everything that happened that summer. If you try to get all you know into one column it will be crowded. We do not offer a prize for the best, because it would be too hard to tell which is the best, but we will pay five dollars for any article we use regardless of its length. We prefer to publish signed articles, but if you object to your name being used say so plainly. And

we want pictures, too, a great many of them, pretty ones and funny ones, artistic ones and ugly ones also if they are ugly enough to be picturesque, from far and near, of motion and of still life, people or stumps, squirrels and mountains, no limitation on size, style or subject. Send as many as you like, for us to take our choice; if you enclose postage and mark your name on them we will try to see that you get back the prints we do not use. Last year our readers responded handsomely to our appeal for photographs so we were enabled to publish an interesting series of about thirty pictures. This year we renew the same offer; that is we will give $25 for the photograph which all things considered is in our judgment the best, and $2 apiece for the others we use. It does not matter whether the photograph is accompanied by one of the first vacation articles asked for above or not, for we shall use articles without illustrations and illustrations without articles in the Vacation Number. But if the photograph is not connected with one of these vacation "stories," write on its back rather a long explanatory title. Pictures and articles must be received by May 1st.

Mollycoddles

PERHAPS President Roosevelt and President Eliot are equally extreme in their emphasis as to the wisdom or folly of college contests of physical power. We can never forget the example of Greece, where the highest intellectual and the highest physical honor were combined in the same people. A community which has a general ambition to excel will include at the same time those who would excel in brains and those who excel in brawn. We recall the subjects of the Pindaric odes. We have not yet discovered reason to fear that so energetic a people as our own, or that such vigorous youth as attend our colleges, lack mental as well as physical stimulus. Those who have the power and will to excel will choose the direction in which their tastes lie, and their abilities as well. The important and essential thing is, the general desire to excel. Where there is a widespread passion of this sort there is no fear on the one side of a decadence to the level of *mañana* and cockfights, or on the other side to the worship of mere brutality.

President Eliot says:

> "The injuries inflicted on the Harvard players were of the same character as were suffered under the former rules, but they were much fewer in number. The spirit of the game, however, remains essentially the same. It therefore remains an undesirable game for gentlemen to play or for multitudes of spectators to watch.
>
> "No game is fit for college uses in which men are often so knocked or crushed into insensibility or immobility that it is a question whether by the application of water and stimulants they can be brought to and enabled to go on playing. No game is fit for college uses in which recklessness in causing or suffering serious bodily injuries promotes efficiency and so is taught and held up for admiration. An extreme recklessness remains a grave objection to the game of football, and it also makes basketball and hockey as developed in recent years undesirable games."

On the other hand, President Roosevelt puts his emphasis not on the roughness and danger of these college sports, but on their noble vigor, for he wants no "mollycoddles." To be sure, he would have honor in the game, and his motto is, "Don't flinch, don't foul, and hit the line hard." So that we presume the two presidents differ only in the emphasis they put on the elements of play. One wants it very strenuous; the other wants it very square, but both want it strenuous and square.

Yet we think it more important to emphasize the decency rather than the strenuosity of football. There are a plenty of brutes and professional coaches with tough heads and hard fists and feet who can do the strenuous; we need gentlemen in the game who hold honor higher than victory. We hear of even basketball games between colleges—this called a ladies' game—in which players had to be called off by the umpire for their unfair violence. It is no pleasant comment on a game as now played that the president of our oldest university should say that it "remains an undesirable game for gentlemen to play or for multitudes of spectators to watch."

Our youth go to college not to develop muscle, but brains. Games are recreation, not business. We would that there were no intercollegiate games that

withdraw attention from study. It is reported that the authorities at Harvard are considering the wisdom of forbidding certain intercollegiate contests, and we should not greatly regret such a decision. We are not afraid that it would encourage a race of mollycoddles.

Peace or War

We are still, as a nation, at the business of slaughtering our working people as remorselessly as tho they were enemies of the republic, to whom quarter was denied. The last report of casualties of the interstate roads gives 9,703 killed and 86,008 wounded (including passengers and "other persons") for the year ended June 30th, 1905. The State roads probably added 1,000 killings and the trolleys 1,500 more, while the coal mines contributed (1905) 2,159 killings. We do not know the returns from the factories and the steel mills, because in only two or three States are the records properly kept. But it is the consensus of opinion among investigators that industrial casualties in this nation number more than 500,000 yearly. Dr. Josiah Strong estimates the number at 564,000. As there are 525,600 minutes in a year, it may readily be seen that every minute our industrial system sends to the graveyard or to the hospital a human being, the victim of some "accident" inseparable from his toil.

We cry out against the horrors of war because the casualties suffered in armed conflict appeal dramatically to our senses. The casualties of industrial warfare we are prone to accept as a matter of course. But the ravages of this industrial warfare are far greater than those of armed conflict. The number of killed or mortally wounded (including deaths from accidents, drownings, suicides and murders, but excluding deaths from disease) in the Philippine war from February 4th, 1899, to April 30th, 1902, was 1,573. These fatal casualties were spread over a period of three years and three months. But our coal mines alone in one year furnished a mortality more than 38 per cent. in excess of this.

The Japanese war is commonly looked upon as the bloodiest of modern wars. According to the official statement of the Japanese Government 46,180 Japanese were killed and 10,970 died of wounds. Our industrial war shows a greater mortality year by year. Bulletin No. 83 of the Census of 1900 gives the rate of fatal accidents for the cities and States requiring registration as 90.3. On a basis of 82,000,000 population this would mean an annual loss of 74,046. Assuming that only 85 per cent. of this should come under the head of industrial accidents proper, we would still have a yearly loss of 62,939.

But we are all of us more familiar with the Civil War, and we know what frightful devastation it caused in households North and South. It was, however, but a tame conflict compared with that which rages today, and which we call "peace." The slaughter of its greatest battles is thrown in the shade by the slaughter which particular industries inflict today. Ask any schoolboy to name three of the bloodiest battles of that war, and he will probably name Gettysburg, Chancellorsville and Chickamauga. The loss on both sides at Gettysburg was 5,662 killed and 27,203 wounded; at Chancellorsville, 3,271 killed and 18,843 wounded; at Chickamauga, 3,924 killed and 23,362 wounded. This is a total of 12,857 killed and 69,408 wounded. But our railroads, State and interstate, and our trolleys in one year equal this record in the number of killings and double it in the number of woundings.

Let us take the Civil War as a whole. According to the revised figures of the Adjutant-General's office (1898), the Union loss was 67,058 killed, 43,012 died of wounds and 40,154 died of causes other than disease. This is a total of 150,224, or a yearly average for the four years of 37,556. Assuming that the Confederate loss approximated 65 per cent. of this, we have an annual average of 62,112 fatalities in one of the greatest and bloodiest of modern wars. But according to the records we are today, in a time of profound peace, killing the same number of men every year.

When the workers were slaves, a good slave was valued at from $1,200 to $1,800. With the enormously increased productivity of the artisan of today, he

should be worth as a chattel something in the neighborhood of $10,000. And were he owned absolutely, his owner would take extraordinary means for his safety. No employer would hesitate at the expense of safeguarding his machinery when he reflected that a little laxity might cause him the loss of a score of men aggregating a value of $200,000. But the workers are not slaves. They are free. And there are thousands and hundreds of thousands of them looking for jobs. The employing class assumes no responsibility for the workman's "keep." When one workman is slain or mangled, another, forced by the necessity of earning his living, is always eager to step into his shoes. And so the conflict goes on without surcease.

We have purposely omitted an attempt at comparing deaths from diseases incidental to war and those incidental to industrial occupation. The figures are too scant regarding the latter to make the comparison worth while. And yet, tho the mortality from disease has been great in most wars, and was particularly so in our Civil War, enough is known to warrant an assertion that the mortality from diseases incident to industrial occupation is far greater. Indeed, the efforts that are now making to preserve the integrity of armies by forestalling deaths from disease in their ranks are meeting with marvelous success. The records of General Oku's army from May to December, 1904, read like the accounts of a miracle. Of 24,642 men treated, there were but 40 deaths, altho 5,609 men were invalided home. The loss by disease in all the Japanese armies was, according to the official statement, but 15,300. In our Civil War the Union loss alone was 224,586.

But it is to the utmost interest of a nation at war to preserve the health of its armies; and so it is found that every modern discovery that makes to this end is availed of. But whose interest is it that the lives of the workers shall be equally guarded? The employing class has no material interest in the matter. The worker is "free," legally, to refuse to work under dangerous conditions. If, economically, he must accept work under these conditions, that is another matter. And so the thing for which we are all to blame—ourselves, for our supineness and indifference, no less than the employing class—goes on and on, and the homes of the people are visited with deaths more numerous than those suffered in a great war. In Tennyson's words:

"Is it peace or war? Civil war, as I think, and that of a kind
Viler, as underhand, not openly bearing the sword"

What is the people's business is the business of our Government, to compel safe conditions as far as possible.

The Third Elijah

THE death of John Alexander Dowie removes one of the most picturesque and extraordinary figures in our modern religious history. He created a new sect, almost a new social institution. He rose to a dazzling pinnacle of ecclesiastical and financial power, and then suddenly collapsed, forsaken at once by his wife, his son and his Church.

He was an English Congregational minister who had a notable success in Australia, and then came to Chicago under a divine impulse, as we doubt not he believed, to restore Apostolic faith and practise, especially in the gift of healing by prayer. Many others have tried faith healing and have found converts to be cured, but Dr. Dowie had unusual powers of address and persuasion, and to these he added an extraordinary executive and administrative ability. He impressed himself on lesser souls, and they could not help believing everything he said. He spoke with all the authority of one who had just received a mandate from God, and he marshaled his believers by the hundreds and then the thousands under him. They were supplied with officers of every grade. No army was ever more fully officered. Every man or woman had something to do, something to obey, and every one must pay tithes. The tithes supplied the financial basis, and the multitudes of healings assured faith, and the sermons of the leader gave confident enthusiasm.

Where else were ever such sermons heard? He had a magnificent voice to fill the vast Auditorium. His doctrine was biblical to the extreme of literalness. There was not in it a touch of heresy.

It was the old Gospel, with a prophetic insistence on all decency and purity of life. It had an Old Testament flavor; hence the tithes and the abomination of pork and, we may add, of tobacco. Then his language was most colloquial, full of the simple devices which keep hearers in strained attention. He appealed to them by question, and bade them respond audible assent to what he said. Thus they repeatedly avowed their acceptance of his claims, and denied the truth of the charges against him. The emphasis of his denunciations was past even biblical parallel. It was a common thing for him in his public sermons to call the users of tobacco "stink-pots," and that is only one example of his coarse freedom. He was the very reverse of the usual conventionalized preacher, and many an occupant of the pulpit might have got a good lesson from hearing him or reading his sermons published weekly in *The Leaves of Healing*. But nothing was so observable as the astounding authoritativeness of his tone. One might be reminded of the protest addressed to a judge by a British barrister that God Almighty would not speak so insolently to a black beetle.

But pride cometh before destruction, and the very physical nature which he claimed to rule by prayer had its revenge of him. For we may assume that a slow and insidious softening of the brain was his undoing. It is a disease, at first not recognized, which destroys the judgment, while it may emphasize the arrogant conceit of one's judgment. He made larger and more dazzling plans. He built his new Zion City. He attempted to convert New York by a sortie. He showed his weakness especially in his assumption that he was the Third Elijah, the Restorer. That he believed it we accept, for he was only half a charlatan. For this new dignity he made himself a coat of more particolors than Joseph or Aaron ever wore. The disease progressed, and he became more exacting as he became more irrational. He assumed the style and extravagances of royalty and traveled around the world visiting his missions. He made the purchase of an immense tract of land in Mexico the excuse for an expedition for his health. His chief subordinates discovered—they could not help seeing—his irresponsible conduct; and he promptly degraded them from their posts of honor. When his insanity became so extreme that he proposed, like the Old Testament Patriarchs, to take a second wife—for that seems to be the fact—his wife and son left him. Hardly had he called one of his apostles, Voliva, from Australia to take the place of those who were deserting him, when Voliva himself recognized the sad condition, and expelled the founder, the Restorer, the Third Elijah, and put him on a pension, and he was forsaken in his mental decrepitude by those whom he had created into a new social and religious state. It was a sad ending of an extraordinary career. Thus he died, yet holding to his own Messiahship, and refusing to be attended by a physician, whose profession he had abused with all possible vituperation.

For he was only partly a charlatan. He believed in himself and all his claims. He was a charlatan in the vain display of his own glory. He misused the funds entrusted to him, all for the cause of Zion City and his own grandeur; for such men think it right to do wrong, so enormous is their conceit of their superiority to the world's formal standards of ethics. We do not call him an evil man, nor say that evil men and seducers wax worse and worse; we prefer to say that megalomania begets disease and disease increases megalomania.

The saddest thing is the new proof of the weakness of human nature, as seen in the multitudes who are ready to follow such a man. To be sure, his extreme orthodoxy of faith and his literal insistence on certain Mosaic commands helped him with literal people; but it was his arrogant positiveness that gained him his disciples. Men of a weaker mind—and few are competent to lead—will follow any propinquity which assumes surely to know and to command. Let a man say, "I know," "This is so," and they will ask no reason. They can even say, *"Credo quia impossibile est."* "I believe it because it is impossible," if commanded thus to believe. So a hundred wild, extravagant apostles and apostolets easily secure thousands of

blind followers, and most easily those that promise miracles of healing.

We hope Dr. Dowie's Zion City will not immediately collapse. It would be interesting to see such a community established. It has certain high social and ethical ideals. It might prosper if well led.

Berea College

BEREA COLLEGE was founded by the Abolitionist John G. Fee. Before the Civil War no negro could be educated, but negroes were received with the white youth from the mountains just as soon as it was legal. They remained, without serious friction, until a wave of anti-negro legislation all thru the South struck Kentucky, and a Legislature, many of whose members had no real desire to transform the college, yielded to it, and past a law forbidding coeducation of the races in any school in the State.

President Frost and the active trustees declare that they did their best to defeat the law, and afterward to have it declared unconstitutional, and we are bound to believe them, altho it has not been easy to convince some of the white and colored friends that they were not at heart as content as were the trustees of Maryville College, Tenn., to have the nego students removed by law.

Ever since President Frost's incumbency it has been the effort to increase the number of white students, in the ratio of six to one, inasmuch as there are six whites to one negro in the State. To be sure, there are other colleges for whites, and none for negroes. Especially was the effort made to draw white students from other States for its less expensive education. We notice in the catalog for 1901-2 that there were 59 students in the four regular college classes, of whom 40 were from other States than Kentucky, and of the 19 from Kentucky, 10 were from Berea, half of them from the teachers' families; but the lower Normal students were mostly from the State. This effort to make the college predominantly white, and for the mountaineers and Northern whites rather than for the negroes, has aroused suspicion and antagonism, and columns and pages of controversy are to be read in the daily journals, especially of Boston. Yet we are not convinced that President Frost and the trustees did not honestly attempt to prevent hostile legislation, and that it was not their real desire to keep this one Southern college open to both races.

But they accept the present law, because they are forced to do so, and they sent their colored students to finish their course at Fisk and Atlanta universities, paying the expense, and calling them back to receive their diplomas. At present they thus pay the tuition of a hundred colored students elsewhere, and are attempting to establish a second college for negroes in the State, which shall be under the same charter.

Now the question is as to how they can do this. A considerable part of the endowment of the college was given definitely for negro coeducation; how much is not clear. President Frost says perhaps as much as $200,000, while other trustees say this is a far too generous computation. Berea has no more than it needs for its own support, not to speak of starting a new co-ordinate branch. Not a dollar of that $200,000 or less is legally set apart for the negroes, and the trustees much prefer to make this necessity the ground for an appeal for half a million dollars for the new department. We see no reason why a considerable sum from their present endowment should not be set apart to back the appeal. Doubtless Kentucky should have an institution of high grade for negroes, which it does not now have, but the appeals are so many that we admire the faith with which the trustees ask for so large a sum, much as it is needed.

It was at a Boston meeting in behalf of the new Berea for negroes that President Eliot made the extraordinary statement that if there were any considerable number of negro students at Harvard it might be necessary to segregate them in education, and he was supported by Bishop Lawrence. Such an utterance, on such an occasion, in an appeal for Berea, and in the presence of its officers, might well be supposed to represent their views and wishes. It

was unfortunately timed, and was quite as unfortunate in its race doctrine.

Swiping

THREE years ago one of the highest officials of one of the largest universities in the United States made complaint that the authorities of the university were puzzled to know what to do with a habit of recent growth, called by those engaged in it swiping, but which to him seemed to be stealing, and nothing short of it. He mentioned, as an illustration, the necessity of closing the library against night work because so many electric lamps were stolen, while books were lost by the hundred. He mentioned a college fraternity, the members of which had agreed to return, after a vacation, with silver enough for lodge furnishing. Their banquets, he affirmed, were actually at the time being served with silver, every article of which had been stolen during that vacation (swiped). Of course, this is stealing, and of course the gentleman whom we are quoting was warranted in his bitter condemnation of the practice; but what could induce or predispose our literary institutions to establish a habit of breaking in upon property rights—a right on which civilization is based? Recalling this general statement to a professor in another institution of high rank, he replied: "The evil is widespread. I have given orders not to have students turned loose in my library when I am absent." He remarked particularly that the guilty ones seemed to have no consciousness of wrongdoing.

The subject brought the following letter from a literary woman well known in one of our large cities:

"When you and I were discussing swiping, at your house in June, you asked me to put down on paper, to the best of my memory, what I told you by word of mouth. I have done so, and you may be sure it is accurate, at least is not over-stated. The young lady of whom I spoke to you is a very bright, handsome girl, a society favorite, and much admired. She was an attendant at a fashionable school, and had a large acquaintance among college boys. She announced to them that she was going to collect a string of 'swiped souvenir spoons,' they must help her make a larger collection than any that the other girls had. In a few months she had become the proud possessor of a ribbon, on which were closely tied dozens of silver spoons, of all sorts and sizes—every one purloined by herself and her admirers. That she was not ashamed of this performance, or in any way sensitive about it, is shown by the fact that this souvenir occupies a prominent place at the present time in her home town; while to me the saddest part of the incident is just this, that neither the fair owner nor her helpers seem to have had any conception that they were doing anything disgraceful; indeed, they openly boasted of their skill in obtaining especially valuable specimens."

The writer of this letter is a woman of peculiar accuracy as well as of the highest moral sentiment. During a personal interview, she not only confirmed every item of the letter, but added that she could point out several other cases quite as flagrant.

In one of our Eastern cities a confirmatory incident occurred at a banquet given by a famous yacht club. The appointments to this dinner were very elaborate and elegant, including beautiful china, made to order, with the monogram of the club. Not only was the silver swiped, but at the close of the entertainment every cup and saucer had disappeared. We have taken special pains to secure confirmation concerning this story of the banquet, and we have gone so far as to secure the testimony of another witness concerning the stolen spoons. This witness writes: "I have myself seen the list of souvenir spoons, and I have heard the whole story from the young woman concerned. It is undoubtedly true in every respect."

This subject has for some time been under discussion, *sub rosa*, with bated breath on the part of older friends, and with a tone apologetic—generally allowing, however, that our schoolboys and schoolgirls are in some way excusable for that which becomes a crime in other people; for hazing, as an instance, accompanied by a good deal of personal abuse; refusing to tell the truth concerning outbreaks, and, under pressure, a good deal of positive lying. We are not among those who believe that it is possible to establish any such modified code of morals for our school folk. But, in order to get at the matter from the right standpoint, we have mentioned it casually to several college students. One or two of these spoke of it as an outrage *per se*, as indecent and immoral, and as estab-

lishing a dangerous bias of educated judgment. The majority, however, laughed off the affair as trivial, while one, a young man of admirable intellectual parts, assured us that the whole affair must be looked upon as a good joke. He seemed to think that young people were quite excusable for being what he called "good fellows," which he defined to be readiness to have a good time and do what the others did—without mussing much over the moral quality of the action. We believe that this is really quite a common opinion, altho the official whom we first mentioned reports that he does not at present either see or hear of as much swiping as he did three years ago.

It does not occur to us as an absolutely novel situation, but much of the sort taken by those boys, now lawyers and ministers, who forty years ago used to invade sap bushes and raid orchards. It is rather an aggravated symptom of a deep social disease. Does this aggravation come to us as anything more than an offshoot of that larger swiping or looting which has become a brilliant and "innocent" element in our business affairs? While the honorable A. B. is scooping in a railroad, why should not his son scoop in a few books from a professor's library or some silverware from a gentleman's table? There is smartness at the top; why not smartness at the bottom? The ethics do not seem to be very sharply distinguishable. There certainly is such a thing as common conscience, as there is common sense. We feel together ethically, as we think together or work together. There may be no better finger-post of whither we are ethically tending than to study just such phenomena as we have been discussing. We do not believe that swiping is universal in commercial affairs, nor any more universal in our schools, but we are unable to deny that there is a great deal too much inclination to leave the moral out of both school life and commercial enterprise.

Mr. Rockefeller's Fortune

Two or three weeks ago, the public was informed by the Rev. Frederick T. Gates, who represents Mr. John D. Rockefeller in the management of several educational or charitable undertakings, that Mr. Rockefeller's fortune did not exceed $300,000,000. This, he added, he had been authorized to say. Moreover, he continued, Mr. Rockefeller had never held as much as 30 per cent. of the stock of the Standard Oil Company. It may be explained that this company paid nearly $40,000,000 in dividends last year, and that its dividends in the last eight years have amounted to about $325,000,000. Doubting persons pointed out last week that, in obedience to the order of the Supreme Court of Ohio, the Standard Oil Company, in June, 1898, filed at Columbus a statement giving the names of the stockholders and the number of shares held by each of them. and that, according to this statement (which has been published), John D. Rockefeller held a controlling interest, or 51⅞ per cent. of the whole number of shares. These critics, however, have overlooked the fact that the present Standard Oil Company was not organized until a year later, in 1899. The statement filed at Columbus, therefore, related to its predecessor or to one of its predecessor's constituent parts, and it does not necessarily conflict with the assertion of Mr. Gates. Inasmuch as Mr. Gates must see that a considerable number of persons think his authorized assertion is at variance with the official record, we suggest that he should show just how large Mr. Rockefeller's interest in the Standard Oil Company has been since 1899, and what his interest was in the predecessors of this corporation. Publicity concerning these things can do no harm and may do some good.

The Iroquois Theater Case

A little more than three years ago, 596 persons were burned to death in the Iroquois Theater, at Chicago. There was abundant evidence that the precautions required by municipal regulations had not been taken. It will be recalled that many of the exits were not only closed, but even nailed up. On the 4th inst., Will J. Davis, the manager of the theater, was brought to trial, having been indicted for manslaughter. Why there had been a delay of more than three years we do not know. Davis was arraigned before Judge Kimbrough, in Danville, the home of Speaker Cannon. The in-

dictment appears to have been based upon a municipal ordinance, which, it was alleged, the defendant had violated. The testimony of the first witness was interrupted by Davis's counsel, who undertook to prove that the Chicago Council had no power to pass such an ordinance, and also that the ordinance was void because it was not sufficiently definite. The reports which we have seen may be incorrect. They show that the court sustained Davis's counsel, holding that the State had surrendered to the city only so much of its sovereignty as would permit the enactment of an ordinance forbidding the erection of wooden buildings within the fire limits, and not enough to warrant further regulations; also that the ordinance was indefinite in that it required certain safeguards in structures designed to accommodate a "large number" of persons, "large number" being a vague term. For these reasons, it is reported, Judge Kimbrough directed the jury to acquit Davis, and this is the end of the attempt to punish some one for criminal negligence which caused a loss of 596 lives. Evidently, there is something wrong and shameful about this. We are unable to say at present whether it is the court, or the prosecutor, or the City Council that deserves to be blamed. But it may safely be said that the failure to inflict any punishment for what took place in the Iroquois Theater on the afternoon of December 30th, 1903, is disgraceful to the city of Chicago and the State of Illinois.

A Square Deal for the Philippines

John S. Hurd, Collector of Internal Revenue in the Philippine Islands, has issued from the Johns Hopkins Press a careful study of internal taxation in the Philippines, with illuminating comparison with our experiences in dealing with Porto Rico. His conclusion is of interest for the next Congress. He says that if the custom barriers were razed and Philippine products were allowed free entry into the American market, it would mean prosperity in the Islands, greatly increased power to purchase American goods, and greatly increased internal revenue collections. Then the Insular Government might dispense with the customs duties on goods imported from the United States, which would be greatly to the advantage of the American manufacturer. The objection comes from our sugar and tobacco interests. And yet we now use all the sugar we produce from cane and beets, and then import more sugar from abroad than the Philippines could produce in generations. And as to tobacco, the total exportation of cigars from the Philippines to all countries in the world is only about 1 per cent. of what is consumed in this country. But the increased demand which the removal of the duty would create would mean very much to the Filipino people. It would mean more schools, more roads and greater prosperity, instead of agricultural stagnation. It is selfish, it is cruel, that we do not give the Philippines the privilege we have given with profit to Porto Rico.

Naval Questions

The attention of the Navy Department is respectfully called to the fact that the public is waiting to hear why the United States battleship "Connecticut" struck bottom the other day near the Culebras drill-ground. If a brand new, seven-million dollar vessel cannot go into waters as well known as this, without getting ashore, the matter is one of grave concern. Information to the effect that Captain Swift is an excellent officer, with an enviable record, does not meet the question, but, on the contrary, gives especial point to it. By way of contrast it may be noted that when the "Rhode Island," some months ago, ran into the mud in Hampton Roads—another place theoretically as well known to naval officers as Broadway is to the New Yorker—there was no delay in telling the country all about it, and Captain Garst was haled before a court martial, convicted and sent home under suspension with all due celerity. There are now plenty of people to remark that Captain Swift of late years has been a prominent member of the General Board, in very close touch with the ruling powers at Washington, while Captain Garst never attained such honors, and, in fact, has devoted a large portion of his career to the prosaic duties of a professor at the Naval Academy. And there are others quite ready to perceive

in the treatment of this last accident evidence of the same policy of suppression which hushed up the disgraceful grounding of the ships last year in New York Bay when following the lead of Admiral Evans. The "Maine" may not have led the fleet over a mudbank, but to accept this it is necessary to believe that the mud found in the "Maine's" condensers miraculously came down the smokestacks. So also the smothering of the collision in the fog at Newport last summer has also been thoro and complete. The "Connecticut" has just arrived at the New York Navy Yard with sixty-five cases of typhoid on board. That also needs very clear explanation; and, incidentally, it may be observed that not only is there no adequate hospital service in the Navy, but Congress has just stricken out of the naval bill an appropriation to establish one, altho nothing could be clearer or stronger than the arguments of Surgeon-General Rixey showing the crying necessity for it. But we can spend twenty millions for two big ships!

Mr. Harriman now wants a "franker understanding" with the people and the Government. Speaking for railroad men, he says: "We have got to come out into the open." He desires to develop "a feeling of co-operation" between the people and the railroads. "I propose hereafter to give the public information and to take it into my confidence." If the Commission should place Mr. Harriman again on the witness stand, perhaps he would now consent to answer in some way those questions as to his interest in large quantities of stock sold by bankers to the Union Pacific, his profits on other stocks sold to the company by himself, and his purchases (if any) of Union Pacific and Southern Pacific between July 19th, when it was virtually decided that a great increase of dividend should be made, and August 17th, when the decision was made public. He admits that he has made mistakes. His refusal to answer these questions was one of them.

We published not long ago on the authority of an erudite correspondent evidence to show that the description of Washington as "first in war, first in peace, and first in the hearts of his countrymen" was not first penned by General Harry Lee, but by Judge Marshall. Several correspondents of THE INDEPENDENT and other papers have controverted this statement. Perhaps the best defense of Lee comes from Arthur B. Clarke, of Richmond, Va., who quotes to us Marshall's own words from his "Life of Washington." He says the set of resolutions in eulogy of Washington was "prepared by General Lee, who, happening not to be in his place when the melancholy intelligence was received and first mentioned in the House, placed them in the hands of the member who moved them," that is, John Marshall. See vol. V, p. 765. This seems conclusive.

Professor Starr, of Chicago University, has returned from a long trip in the Congo Free State, and he says the stories of atrocities are exaggerated. But he admits that the tribes are required to pay tribute in rubber. Why should they pay any tribute at all in their own land? —and that if they fail to do it punitive expeditions are sent out, and the native soldiers, after their warlike custom, cut off the hands of the dead, and sometimes by mistake of the wounded. That is confession enough.

This is the way Dr. Dowie issued his commands. We quote from *Leaves of Healing*, August 15th, 1903:

"Let all who have taken the Restoration Vow remember that, as Elijah the Restorer, we have given the command to every member of the Host to proceed with us to New York; and that, unless there is sufficient cause, such as will justify them before the Judgment Seat of God, they dare not disobey this command."

That visit was a failure, and the beginning of Elijah's downfall.

Oh, yes, says Germany; we will consent to disarmament on any fair basis, say of population or commerce; but not on any proportion to present armaments, for our army is not too large now, and our navy is much too small. Those who do not wish to reduce the burdens can easily find excuses for refusal. The Emperor dissolved his Reichstag because it would not consent to a large colonial army, and the new Reichstag submits.

Insurance

The Perkins Campaign Gift

FOLLOWING his acquital on the charge of larceny by the Court of Appeals by a vote of four to three, as noted in this department last week, George W. Perkins has refunded $54,019.19 to the New York Life Insurance Company. This sum, including interest, represents the contribution made by him on behalf of the company to the Republican National Campaign Committee in 1904 for which he was subsequently reimbursed by the New York Life. The action of the company in this transaction was declared illegal as the payment could not be considered to be for the corporate purposes of the company and Mr. Perkins has now closed the incident by issuing his personal check to cover the amount involved in favor of the New York Life.

In this connection it is of interest to note the fact brought out by the Armstrong Committee that the contribution was not accounted for in the report made by the New York Life to the Superintendent of Insurance.

Some of those who are inclined to criticise Mr. Perkins assert that, ten months after the contribution was made, Postmaster-General Cortelyou (who had been chairman of the Republican National Committee) executed a ten year contract with the International Mercantile Marine Company (of which Mr. Perkins was an influential director) for carrying the mails, at a price which yields about $750,000 a year. Attention was directed to this in a statement published on the day immediately preceding the refunding of the contribution, and some interest was excited in this addition to the history of the controversy.

The Liberty Life Insurance Company

ANNOUNCEMENT was made last week of the formation of a new life insurance company to be called the Liberty Life. This company has progressed with its organization to the point of having paid up its capital of $175,000, including a surplus of $50,000 and further sum of $25,000, subscribed as an organization campaign fund, and elected its officers. The new company will do business at No. 111 Broadway as its home office. It will work along similar lines to those guiding the North American Life Insurance Company, which was incorporated last December to take over excess business of the giant concerns, which, under the prevailing Armstrong law, will not be permitted to write over $150,000,000 worth of annual business.

William H. Lynn will head the Liberty as president, with General George M. Smith as first vice-president, Albert C. Case, second vice-president; D. D. Allerton, secretary, and Charles Badgley as treasurer. The directorate is made up as follows: W. J. Courtney, Walter A. Burke, D. D. Allerton, Mason B. Starring, Russell Harding, W. H. Lynn, Edward J. Welsh, George M. Smith, Thomas J. O'Donahue, Albert C. Case, Rudolph Kleybolte, Charles Badgley, W. F. White, Joseph Dickson, S. D. Lounsbery, Christian F. Tietjen and William B. Clark.

Non-participating policies will be a feature of the new company's business, and its organizers direct attention to the fact that none of its officers or directors represent any insurance interest.

This seems to be an era of insurance legislation. Following an epoch where the insurance business was neglected to a very considerable extent, we are now confronted by legislation that threatens not only to be restrictive, but in some cases absolutely prohibitive. Nearly 300 bills having insurance as a moving cause are pending in thirty-two States, and the end is not yet. Grover Cleveland recently touched upon this phase of present day tendencies and decried the unreasonable conditions that are being emphasized in some of the proposed measures. The Missouri situation, to which we referred last week, is to be followed in other States, and the revolt against the insurance companies threatens to go to unreasonable lengths unless the legislative forces can be made to see that a community of interest still exists between the several States and the insurance companies.

Financial

The Stock Market

LAST year's crops were not a dream. Activity in the iron industry has not been checked. The productive capacity of manufacturing concerns is still insufficient to supply demands promptly. Consumption is upon an extraordinary scale. General trade is good and improving. Prosperity still prevails. Fundamental conditions have not called for that continued and sensational decline of the market value of securities on the Stock Exchange which is the subject of so much comment.

There have been reasons, however, for a part of the recent decline, reasons that have tended to prevent new investments in railroad shares and to cause some liquidation. These are the revelations of the Harriman investigation, the pessimistic predictions of indicted capitalists, an increase in the cost of railway operation which promises to overtake the increase of profits, and the restrictions of new State legislation concerning railway rates. The public, for these reasons, probably reached the conclusion that conditions warranted no advance in railway shares, but pointed to some natural decline.

All this does not account for the extraordinary course and character of the market. The main cause of the sharp fall and enormous volume of transactions has been speculation on a large scale by persons controlling great quantities of capital who have sought to depress values either for immediate profit or for an extension of power. An incident of their campaign appears to have been a transfer of the control of the Reading system at the time when the decline was temporarily interrupted on the 6th. An impression prevails that control of that property (accompanied by a profit of several millions) now rests with Mr. Frick, an associate of Mr. Harriman. Other readjustments of control, as a result of the campaign, may hereafter be disclosed. Thus far, these recent operations of giant speculators have not perceptibly affected general industrial and commercial conditions. But it is possible so to extend and prolong such a movement that the effect of it will be felt throughout the country, even if the movement begins, in a time of general prosperity.

....While our imports of automobiles last year were nearly $5,000,000, our exports were almost as great, amounting to $4,409,186, and machines representing nearly half of this value were sent to Europe.

....Net sales of the American Woolen Company in 1906 were the largest in the company's history. Earnings, both gross and net, showed a considerable increase over those of 1905. In the eight years of the company's life, $22,437,000 has been earned for dividends, and $11,327,000 has been distributed. A net surplus of $11,110,000 remains, after liberal charging off for depreciation.

....Fisk & Robinson, the well-known bankers, in their Monthly Bulletin of Investments for March, discuss the condition of the railroad bond market. Pointing out their reasons for expecting a gradual easing off in rates for time money, and referring to the approaching reinvestment of money now held in the Government 4 per cent. bonds of 1907, they direct attention to the present low price of first-class railroad bonds. Taking twenty-seven representative issues, they show that the average price of them last month was 101.23, against 106.98 in February, 1905.

....Large increases in all departments are shown in the report of that great corporation, the Pennsylvania Railroad Company, for the calendar year 1906. Gross earnings of the entire system were $295,898,165, an increase of nearly $30,000,000; net earnings were $84,354,399, or $10,385,000 more than those of 1905. The increase in the tons of freight carried was nearly 11¾ per cent., and the number of passengers was greater by 11½ per cent. than in the preceding year. Altho large sales were recently made, the company still owns securities of other corporations for which it paid $194,000,000. These investments yielded a revenue of nearly $12,000,000. The report contains interesting statements as to the progress of the tunnel and terminal improvements at New York.

The Independent

VOL. LXII NEW YORK, THURSDAY, MARCH 21, 1907 No. 3042

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Railways and the Government

J. Pierpont Morgan went to Washington on the 11th, and in the evening had a talk with the President about the railway situation. After leaving the White House he authorized the publication of a brief statement. He had come to the capital, he said, at the request of many business men, to discuss with the President the present business situation, particularly as affecting the railroads:

"I suggested to the President that it would be greatly in the public interest if he would see Mr. McCrea, Mr. Newman, Mr. Mellen and Mr. Hughitt, and confer with them as to what steps might be taken to allay the public anxiety now threatening to obstruct railroad investments and the construction so much needed, and especially to allay the public anxiety as to the relations between the railroads and the Government. The President said he would be glad to see the gentlemen named, with this end in view."

On the following day Mr. Morgan sailed for Europe. The four gentlemen of whom he spoke are (in the order given above) the presidents, respectively, of the Pennsylvania, New York Central, New York, New Haven & Hartford, and the Chicago & Northwestern railroads. At the beginning of the present week no one of them had called at the White House. It was asserted that Mr. Morgan made the proposition without consultation with them. It was also said that they were waiting for a direct invitation from the President. The common belief in Washington was that for this they would wait in vain, altho Mr. Roosevelt was willing to talk with them at any time. There was some recovery in the stock market on the 11th and 12th, but the decline set in again on the 13th and became violent on the 14th, when the loss on prominent securities ranged from 5 to 20 points. In the two days the transactions amounted to nearly 5,000,000 shares. To relieve the money market, Secretary Cortelyou gave notice that he would redeem $25,000,000 of the 4 per cents. of 1907, and would grant more time with respect to the September deposits and the circulation taken out a few months ago upon the security of State and municipal bonds. On the 15th, the four presidents held a conference in New York and decided not to go to Washington in a group. They felt, it was explained, that they had not been authorized to represent the railroads of the country, and that they could not undertake to present the views of all the railway managers, as the latter were not in perfect accord. But Mr. Mellen sought an interview with Mr. Roosevelt, who agreed to talk with him on the 19th. Following the panicky break of the 14th, market values rose in the stock market on the 15th and 16th. It is evident, from the public statements of many prominent railway men, that they now prefer supervision by national authority to the action of State Commissions and Legislatures. This also appears to be the preference of Mr. Roosevelt. But there is no indication that his views and purposes have been changed by the sharp fall of prices on the Stock Exchange. It is known that his program of legislation to be recommended to the coming Congress includes control of railway and other interstate corporations by Federal license, control of capitalization, and probably an official valuation of railway property. He

says that, while railway companies which obey the laws have nothing to fear from his action, those which break the laws will be prosecuted. It is thought that at his recent conference with Governor Deneen, of Illinois, the issue of Alton securities by the Harriman syndicate was one subject of discussion. Governor Johnson, of Minnesota, says that supervision of railways by the national Government alone would be an ideal solution of the problem. Mr. Bryan remarks that the railways prefer national supervision because the State Legislatures are nearer to the people than a national Commission can be. The difficulty encountered now by the roads when they try to borrow money is due, he adds, to the recent evidence of stock watering and rotten management; and the roads, by crying that the new 2-cent laws would ruin them, have frightened investors. It is the opinion of Thomas F. Ryan that the President's purpose is to enforce the laws. "I think," he says, "that the sooner the business men of the country decide to aid him in solving the problems that confront him every day, the sooner confidence will be restored and the business of the country move on without interruption. So far as general business is concerned, the only fault to be found with it is that it is too active."

Public Coal Lands Released

About 28,000,000 of the 64,000,000 acres of land withdrawn from entry by the President in October last have been restored to the public domain by a modification of the original orders. Congress failed to authorize the President to lease the withdrawn coal lands on a royalty basis. It was his aim to prevent the acquisition of these lands in the interest of monopoly by companies or individuals in alliance with railroad corporations. In a letter to Secretary Garfield (March 12th) the President says that his action is due to "the reports of the Geological Survey on the character and quality of the lands withdrawn from coal entry." He continues as follows:

"All lands which are now reported by the Geological Survey to contain no workable coal shall be immediately released. All lands which contain workable beds of coal, and concerning which the Geological Survey has sufficient information available to enable you to properly classify them, shall be open to coal entry as soon as you shall classify such lands and promulgate rules and regulations for making entry. Hereafter other lands shall be similarly opened to entry as rapidly as the Geological Survey can make proper examination thereof and report to you. I am advised that under this order about 28,000,000 acres of coal land will immediately be opened to entry."

In another letter he cancels his order of February 12, relating to evidence of title under the public land laws, "for the reason that Congress did not appropriate an amount sufficient to enable the Commissioner of the General Land Office to properly carry out the purposes of the order, which were to have such examination made of all applications for patents as would facilitate the issuance of title to bona fide settlers and reduce illegal entries to a minimum."

Japanese School Children and Laborers

Yielding to an urgent request from President Roosevelt, the California Legislature decided, on the 11th, that it would take no further action upon three pending measures involving discrimination against the Japanese. One was the bill relating to land titles or leases, to which we recently referred. Another was a bill providing for an expression of opinion as to Japanese, or "Asiatic," exclusion at the national election in 1908. These measures had been passed by the Senate, and action upon them was about to be taken in the House. That day, Governor Gillett received the following telegram from Mr. Roosevelt:

"Action of Legislature reported in this morning's papers most unfortunate in effect upon my efforts to secure exclusion of Japanese laborers by friendly agreement, and if continued will probably render recent legislation of Congress for that purpose ineffective. Please secure suspension of further action until receipt of letter from me."

This telegram was promptly transmitted to the Legislature, with a brief message in which the Governor said it appeared to be important that no action upon the measures should be taken, and expressed a hope that no mistake would be made. Whereupon the House voted to take no action. On the following day the Legislature adjourned. In a second

telegram to the Governor, President Roosevelt (replying to an inquiry from the Governor) said, referring to the bill for a submission of the question of Japanese exclusion to the voters of California in 1908:

"The assumption of power by the voters of California to settle this question, if assented to by the National Government, would immediately end all my negotiations with Japan for friendly adjustment, because to negotiate a settlement we must have power to settle, while, on the other hand, California cannot negotiate a treaty under the Constitution."

Such a vote in California, he continued, would have to be treated as entirely nugatory, but by those opposed to exclusion it would be regarded as a threat to ignore the Constitutional power of the United States and to exclude Japanese in defiance of their treaty rights:

"I earnestly deprecate the passage of any legislation affecting the Japanese. The national Government now has the matter in hand, and can, in all human probability, secure the results that California desires, while at the same time preserving unbroken the friendly relations between the United States and Japan. I have the interest of California most deeply at heart. I shall strive to accomplish for California, as for other States or sections of this country, everything that can conserve its honor and its interests."

On the 13th, the San Francisco Board of Education adopted the resolutions agreed upon at the conference in Washington, which provide that Japanese children shall be admitted into the public schools. Mr. Roosevelt sent his thanks and congratulations, saying also that he had directed a dismissal of the test suits instituted by the Federal Government. On the following day he issued an executive order, under the authority granted by the new Immigration act, directing that "Japanese or Korean laborers, skilled or unskilled, who have received passports to go to Mexico, Canada, or Hawaii, and who come therefrom, be refused permission to enter the continental territory of the United States." This action is taken, the order says, because the President is satisfied that such passports are being used to enable the holders of them to enter the States, "to the detriment of labor conditions therein." These are the words of the statute, in the amendment attached to the Immigration bill at the President's request and in fulfillment of his agreement with Mayor Schmitz and the San Francisco Board of Education. On the same day, nine little Japanese girls applied at one of the San Francisco primary schools for admission and were taken in.

Inland Waterways Commission

President Roosevelt has decided to appoint an Inland Waterways Commission, whose duty will be to prepare and report a comprehensive plan for the improvement and the control of the river systems of the United States. The eight men whom he has asked to serve as members of this commission are Representative Theodore E. Burton, of Ohio, chairman of the House Committee on Rivers and Harbors; Senator Francis G. Newlands, of Nevada; Senator William Warner, of Missouri; John H. Bankhead, for many years a Representative from Alabama; Gen. Alexander Mackenzie, Chief of Engineers of the army; Dr. W. J. McGee, geologist and formerly president of the National Geographic Society; F. H. Newell, director of the Reclamation Service; Gifford Pinchot, Chief Forester; Herbert Knox Smith, Commissioner of Corporations. In a long letter addressed to each of them the President explains his purpose. Our inland waterways as a whole, he says, have received scant attention. The time has come for merging all local projects in a comprehensive plan designed for the benefit of the entire country, a plan including a consideration of all the uses to which streams may be put. No longer are the railroads able to move crops and manufactures rapidly enough to secure the prompt transaction of the nation's business, and there is small prospect of immediate relief by rail. "There appears to be but one complete remedy—the development of a complementary system of transportation by water." Floods, and the control of them by forests or otherwise, should be considered, and, broadly, the relations of the streams to the use of all the great permanent natural resources. Consulting members will be appointed hereafter.

Prosecution of Trusts In Chicago, on the 12th, a Federal grand jury returned indictments against F. A. Holbrook, nine manufacturers of church furniture, and as many manufacturers of school desks, for violation of the Sherman Anti-Trust law. In addition, petitions were filed for injunctions to restrain about forty officers or employees of the companies from further violations of the act. The accused companies have factories in half a dozen States and control 80 per cent. of the trade in church pews and school furniture.——The Department of Commerce and Labor has begun an investigation (as directed by Congress), concerning the International Harvester Company, commonly called the Harvester Trust. It is trying to ascertain whether competition in local trade has been suppressed and whether the quality of farm machinery is as good as it was before the combination was formed. In Missouri, the House has instructed the Attorney-General to inquire concerning this Trust, and to begin proceedings for ousting it from the State, if the facts ascertained warrant such action.——In the main suit against the Standard Oil Company, John D. Rockefeller, H. H. Rogers and others, under the Sherman act, the defendants set up a claim that the Circuit Court in Missouri had no jurisdiction. Elaborate arguments were made before Judges Sanborn, Hook, Vandeventer and Adams, who have decided by unanimous vote that the court in question has jurisdiction. Therefore the defendants must answer at St. Louis.

Municipal Offenses W. A. Martin, a Pittsburg Councilman, has been sentenced to be imprisoned in the penitentiary for three years because he solicited a bribe of $70,000 from the president of a trolley company that was seeking a franchise. It is alleged that he represented a combination of Councilmen.——In Columbus, Ohio, Frederick J. Immel, president; Frederick Lied, vice-president, and Charles E. Burr, a member, of the Board of Public Service, with several other persons, have been indicted for receiving bribes in connection with a contract for paving given to the Trinidad Paving Company, of Cleveland. The former superintendent of the paving company's work in Columbus, an assistant city engineer and an inspector, who were indicted, have pleaded guilty and been fined. They will testify for the prosecution in the proceedings against the higher authorities.——In Peoria, Ill., City Clerk Joos and three former deputies of the sheriff have been indicted for embezzlement and fraud. It is estimated that Joos's stealings amounted to $40,000, and that the frauds in connection with the management of the county jail involved a loss of $30,000.——By vote of the Councils in Philadelphia, and with the consent of Mayor Weaver, the controversy concerning alleged frauds for the benefit of Contractor McNichol in connection with the filtration works, is to be referred to ex-Judge Samuel G. Thompson, as arbitrator.——The Tennessee House of Representatives has ordered the arrest of Mayor Morris and twenty-three Councilmen of Nashville for contempt. At present there is only one telephone company doing business in that city. While the Legislature was considering a bill permitting another company to compete without obtaining the consent of the local authorities, the Council voted exclusive rights to the company now controlling the field, in return for an annual payment of $10,000 to the city and for certain other concessions. This action was approved by the Mayor.

Various Topics After the President had decided that the Nobel Peace Prize awarded to him (about $37,000) should be used for the promotion of industrial peace, a bill was introduced in Congress providing for an institution upon this foundation. This bill was passed at the end of the recent session. It names as three of the seven trustees the Chief Justice of the United States, the Secretary of Agriculture, and the Secretary of Commerce and Labor. In obedience to the requirements of the act concerning the remaining four, President Roosevelt has appointed John Mitchell, president of the United Mine Workers, as "a representative of labor"; Marvin Hughitt, president of the Chicago & Northwestern Railroad Company,

as "a representative of capital," and, as "representatives of the general public," Seth Low, of New York, formerly president of Columbia University and mayor of that city, and Thomas G. Bush, of Birmingham, Ala., the president of two coal and iron companies. Nobel's will requires a prize winner, if it be feasible, to give a lecture at Christiania within six months of the award. Mr. Roosevelt cannot do this within the specified time, but it is said that he intends to visit Norway and make an address at Christiania soon after the end of his present term.——A long and circumstantial account of the affray at Brownsville, alleged to be the confession of a negro named D. C. Gray, who was a member of one of the companies discharged by the President, has been published in Galveston. It implicates fifteen members of the battalion. At last accounts it had not been proved that a soldier of this name was in either of the two companies.——The Oklahoma Constitutional Convention finally adjourned on the 15th. Among the propositions rejected were those for woman suffrage and for a separation of races on railway trains. Adopted propositions include those providing for the initiative and referendum, the nomination of State officers and United States Senators at primaries, a very stringent prohibitory liquor law, and an elective railroad commission. The issue of watered stock and the holding of coal mine property by railroad companies are to be forbidden.——The Oceanic Steamship Company, of San Francisco, has withdrawn from service its three principal steamers, the "Ventura," "Sonoma" and "Sierra," which have been plying between that port and Australia. Among the causes assigned for this action are the withdrawal of the New Zealand Government's mail contract, amounting to $100,000 a year, and the recent failure of the mail subsidy bill at Washington.

The War in Central America

Altho the reports received from Nicaragua are sharply at variance with those sent out from Honduras, it appears to be true that Nicaragua has made considerable gains in the war. On the 13th, a battle continuing for fifteen hours was fought at Maraita, near the Honduran capital, and the forces of the Honduran Government were overcome by a combination of Honduran revolutionists and Nicaraguan invaders. On the following day, President Zelaya (of Nicaragua) issued a decree recognizing the "provisional Government" of the revolutionists and formally accepting them as allies. His forces also took from a steamship 1,000 rifles consigned to the Honduran commander. But on the 16th it was reported that the revolutionists had suffered defeat and lost their leader, General Gutierrez. President Bonilla (of Honduras) has the assistance of Gen. Francesco Ruiz Sandoval, a soldier of fortune who has taken part in many Central American or South American revolutionary movements and has never been on the winning side. Bonilla has been at the front by day and at his capital by night, passing to and fro in an automobile. But the capacity of the machine has not been severely taxed, for the Nicaraguan army has placed the front within a few miles of his capital. Sensational reports about an application of force at Managua to William L. Merry, our Minister to Nicaragua, Costa Rica and Salvador, have been denied, but there is reason to believe that he is no longer *persona grata* to President Zelaya.

Explosion of the "Jena"

The "Jena," the finest battleship in the French navy, was destroyed by the explosion of its magazines on March 12th while in the dry dock at Toulon. Eight officers and 110 men were killed and 38 injured. The vessel had been put in the Missiessy dry dock for painting and the repair of its machinery. There were 21 officers and 685 men on board. The cause of the accident is not known. It is thought to have been due to the spontaneous combustion of the black powder in the shells, which is liable to deterioration and has to be carefully watched; but another theory accounts for it by the careless handling of

a torpedo. The explosion shook the town like an earthquake, and for two hours the vessel looked like a volcano in eruption, sending high into the air shells, fragments of machinery and human remains. The buildings in the vicinity of the dock and some in the city were bombarded. One shell struck a house one thousand yards away, killing a baby. In spite of the fact that the battleship was supposed to be to a large extent fireproof, it was completely burned out inside with the exception of a small part of the forward end. All the furniture, deck, boats and woodwork were burned, and the steel beams and plates were twisted and blistered. A hole 18 feet long and 12 feet high was blown thru the armor on the port side amidships. This affording an outlet for the gases generated by the explosion prevented the bursting of the vessel. The poisonous fumes of the powder filled the ship and the dry dock and asphyxiated many who had not been killed by the shock. Volunteers were called for to open the gate of the dry dock in order to let in the water on the burning ship, but the six men who attempted this were killed or wounded. Finally a breach was made in the dock gate by a shell from the warship "La Patrie." Ten of the guns were seriously injured, and it is feared that the vessel can never be repaired so as to be of service again. The catastrophe will bring much sharp criticism upon the Ministry of Marine, because there have been in the past few years an alarming number of naval disasters. Since January 1st eight vessels of the French fleet have been lost or disabled, the most serious of these accidents being the destruction of the cruiser "Jean Bart," which went ashore on the northwest coast of Africa February 19th, after a mutiny. Five days after the "Jena" disaster a French torpedo boat and a destroyer maneuvring without lights near Corsica ran into each other and both were damaged. The opponents of the French Government claim that the leniency shown to mutineers on the naval vessels and to strikers in the yards has made proper discipline impossible and destroyed the efficiency of the French navy.

Secondary School Reform in Germany

The three kinds of secondary schools in Germany leading up to the universities, each with a nine years' course, the classical Gymnasium, the semi-classical Realgymnasium, and the purely scientific Oberrealschule, have, chiefly thru the influence of the Emperor, been put on an equality, in so far as the graduates of any of them are now admitted to all the departments of the universities. Other reforms are being pushed, notably the introduction of an elective system in the higher classes, giving the pupil a choice of those studies which will be helpful in his future special career. The Saxon Government has decided to try an experiment of this sort in three of its gymnasia, a choice to be granted between a linguistic and a mathematical course. Several learned organizations, notably the National Association of Engineers, have demanded the establishment of a "Reform" gymnasium course, which has been experimented with in some localities in a private way, and which has in its lowest six classes absolutely no classics, and in the three upper is divided into three sections, namely, a classico-historical, one of modern language, and one of mathematics and natural sciences, all three of which lead up to a *testimonium maturitatis.* The National Medical Association of Germany has joined in with this demand, insisting that a certain number of classical schools be changed into "Reform" gymnasia. Another innovation in these secondary schools is that they will probably now be opened to girls as well as to boys. The city of Dresden has decided to try this experiment after Easter with its three secondary schools, and the City Council has appealed to the State Government to establish at least one gymnasium exclusively for girls in Dresden. Heretofore the secondary schools of Germany were hermetically sealed to the latter.

Delay in the Duma

There has been another week's delay in beginning the work of the Duma. This is partly accidental and partly intentional. The leaders of the Constitutional Democrats evidently believe that procrastina-

tion in the work of organization is of advantage to them, as they are gaining in influence over other parties during this period of preparatory committee work, and the rasher and more partisan members of the extreme Right and Left are having time to cool off and to consider the consequences of their proposed actions. The first business session of the Duma was scheduled for March 12th, but it was discovered that the Conservatives of the Right intended to take advantage of it to bring before the Duma a proposition to hold a requiem service on March 14th, the anniversary of the assassination of Alexander II. In such a memorial service many of the members of the Duma could not conscientiously take part, nor could they with propriety refuse, while the mere introduction of such a proposition would have excited some of the Socialists to violent language, which might have afforded an excuse for the dissolution of the Duma. To avoid this President Golovin postponed the session to March 15th, but early in the morning of that date the ceiling of the hall in the Tauride Palace, where the Duma meets, fell to the floor, a distance of thirty feet, so the session had to be postponed indefinitely until a suitable hall could be found. At first it was rumored that the collapse was a bureaucratic attempt to destroy the Duma, and some show of reason was given to this theory by the fact that the plastering, lathing and heavy chandeliers fell upon the seats of the Left and Center, while ministerial benches and the section occupied by the Right were uninjured, but further investigation shows that it was an accident due to careless workmanship in putting the new ceiling and electroliers on rafters which had not been renewed since the palace was built by Catherine II. The fact that neither the Czar nor the Premier took the trouble to extend their congratulations to the members of the Duma on their narrow escape from death has created a very bad impression. The Constitutional Democrats have succeeded in winning over the Radical members of the Duma with the exception of the Social Democrats to a non-provocative policy which will give no excuse for arbitrary dismissal by the Government. At the last Duma the Ministers were received with denunciation and hisses whenever they appeared before the House, and the Duma unanimously demanded their dismissal and a proclamation of general amnesty. If the policy advocated by the Constitutional Democrats is carried out there will be no such violent demonstrations or unconstitutional action in the present Duma. Their Premier's declaration of policy will be received in silence and the House will then proceed to its regular business.——Disorder is increasing in Poland. The Terrorists in Lodz have killed a number of policemen and soldiers, and the troops have retaliated by knouting and shooting innocent persons on the street. General Neplueff, commandant of the fortress of Sevastopol, has been removed to another post on petition of the inhabitants of the city, who complained that their nerves were becoming shattered by the attacks made on him whenever the commandant appeared in public. Two attempts had been made upon his life by bombs, and in both cases he escaped harm while many of the bystanders were killed or wounded. The director of the Polytechnic Institute at St. Petersburg has been dishonorably dismissed and will be prosecuted for criminal negligence on account of the discovery of arms, ammunition and bombs in the students' rooms by the police. At Yalta in the Crimea a bomb was thrown at the commandant in the garrison, slightly wounding him. Instead of forcing an entrance into the house by the police, the building was set on fire, and while it was burning a large number of bombs were heard to explode.

French Notes

Premier Clemenceau was sharply criticised in the Chamber of Deputies by the Socialists for threatening to put the electricians of the army in the place of the strikers who deprived Paris of light and power last week. M. Jaurès accused the Premier of robbing the strikers of their natural rights by "this arbitrary measure by which the army engineers became the coadjutors of the capitalists against the workingmen." The Premier, in his usual direct and vigorous style, assumed full responsibility for the action of the Government, which, he said, was necessary to protect the public against the tyranny

of a small minority. Two men would not be allowed to settle a private quarrel by shooting at each other on the boulevards, thus endangering the people in the vicinity. M. Clemenceau concluded with the remark, "I did what I thought was right and I will do it again tomorrow unless you turn me out of office today." As a response to this the Chamber voted confidence in the Ministry by 378 to 68. ——To settle the question that has been disturbing French politics for several years, that is, whether employees of the Government have the right to form unions and to strike, the Minister of Justice, M. Guyot-Dessaigne, has introduced a bill authorizing State officials, except those of the police, military and legal service, to form unions, but providing severe penalties for striking or inciting others to strike.——M. Casimir-Perier, who was President of France for six months, resigning January 15th 1895, died on March 11th.

Bulgarian Premier Assassinated

Premier Petkoff, of Bulgaria, was assassinated in Sofia March 11th. He was walking in the Boris Gardens when a man approached and fired three shots at him with a revolver. One of the ministers accompanying him was wounded. The assassin, whose name is Petroff, declared when arrested that he committed the act to free Bulgaria. Petkoff was the leader of the Stambuloff or anti-Russian party. He had been an intimate friend of Stambuloff, the "Bismarck of Bulgaria," and was driving with him in a carriage in 1895 when Stambuloff was assassinated by three men, who stabbed him twenty times with their knives. The murderers of Stambuloff were never punished, as the crime was a political one and doubtless instigated by men higher up. Petkoff was the son of Bulgarian peasants and had fought in the war for independence in 1878, where he lost his right arm. He is succeeded as Premier and Minister of the Interior by Dr. Goudeff, president of the Sobranje or National Assembly. There will be no change in the policy of the Cabinet, which will continue to follow the policy of Stambuloff, and will be in opposition to Prince Ferdinand.

The Shah and the Parliament

It appears that the Persian National Assembly has won in its contest with the new Shah and has practically supreme control in the Government. The demands which the Parliament made upon the Shah on his accession were: (1) For the recognition by him of the establishment of the constitution and the admission that he is a constitutional sovereign and not an autocrat; (2) the limitation of the number of ministers to eight, who should be responsible to the Assembly; (3) the dismissal of the Belgian officers in charge of the customs, and (4) the establishment of local assemblies. Each of these demands was stubbornly resisted by the Shah, and it was only after the people had risen in Tabriz and seized the arsenal and Government offices and imprisoned the Governor, that the Shah finally gave way. M. Naus, Minister of Customs and Posts, and M. Priem, Chief Administrator, both Belgians, were dismissed. All of the members of the Assembly then took the oath of allegiance. Among their first acts was the suppression of the practice of selling administrative and army appointments. In order to prevent extortion the new Governor of Khorassan will be given a fixed salary and held strictly accountable for the taxes collected. The Assembly has formed and equipped a National Guard composed of several hundred men, who drilled daily near the House of Parliament until it was stopped by the Shah on the ground that it alarmed the population. A telegram of congratulation was unanimously voted to be sent to the new Russian Duma. A National Bank of Persia has been founded and the Assembly has authorized the bank to advance to the Government $3,900,000 for the payment of the army, and to meet the cost of the diplomatic missions and the expenses of the court. The patriotic spirit has taken the form of boycott of European imports, particularly tea and sugar. The disturbances in the mountainous districts of the interior continue, and foreign intervention may be required at any moment. Russia and Great Britain are prepared to act in harmony in such an emergency.

Ice and Bacteria

BY J. C. BAYLES, M. E., Ph.D.

AN awakened public interest in the hygienic aspects of ice cut from more or less polluted waters and furnished for domestic consumption in cities invites a discussion which at its beginning is likely to be characterized by many of the symptoms of hysteria. As "news" we can scarce expect it to be treated other than sensationally, and the first to discuss it for the public information are likely to be those who know least about it. For such as deem it a matter of concern to themselves or to the general public, a brief summary of the facts will have interest.

Until lately it was confidently asserted and generally believed that running water purified itself, and that in freezing water rejected such impurities as it might contain. These were plausible half truths, and for that reason more dangerous than falsehoods. If foul water runs long enough and under proper conditions to effect complete æration, it loses many impurities and may sometimes be restored to potability. The ice crystal probably rejects suspended impurities and approximates purity as closely as possible. To go further is to leave truth behind. A great deal of running water is dangerously impure, and in the stars and flowers of ice all sorts of impurities are locked up and held. This would seem to warrant the conclusion, easily verified, that ice is not necessarily pure even when formed by the freezing of running water.

Another and more dangerous error was long taught by those who believed that freezing water sterilized it, and that at the temperature of congelation dangerous bacteria were destroyed. If that were true the subject might be dismissed without discussion; but it is not true. Exact knowledge on this subject is of comparatively recent date. The first authoritative experiments to determine the sterilizing influence of frost which are of record were made in 1871 by Professor Burdon-Sanderson, who found that water melted from the purest natural ice obtainable was by no means sterile, but that in a suitable culture medium therewith inoculated microzyme cultures were obtainable. This started a line of interesting experiments, which engaged the attention of every bacteriologist in Europe. Von Frisch went to the other extreme. He froze putrefying solutions, kept the frozen mass at the temperature of —87° C., and, after the lapse of many hours, found that sterilization had not been effected. Perhaps this was expected, but Sanderson's conclusions were not. They were verified by a great many experimenters with results showing that ice at the summit of Mont Blanc was full of bacteria; that the same was true of hailstones and snow from the highest altitudes which man could reach, and that natural cold was by no means capable of accomplishing the sterilization of water. In 1884, at a meeting of the Academy of Natural Sciences, held in Philadelphia, Professor Leidy showed, in water from freshly melted ice, living infusoria, rotifers and worms. Pictet and Young, not quite satisfied with the results already obtained, took various species of bacteria of the kind usually found in water from melted ice, maintained them at temperatures ranging from —70 to —130° C. for 180 hours, and found the pathogenic varieties as industrious as before. Kowalski tested sixty specimens of natural ice and found not one of them sterile, obtaining by culture methods from ten to one thou-

sand colonies per cubic centimeter (about twenty drops). All this turned attention to the practical aspects of the matter from the point of view of State medicine. Frankel and Heyroth tested the ice supply of Berlin and found it to contain a variable bacterial population, up to about 25,000 per cubic centimeter. Uffreduzzi tested ice from the Dora, which supplies Turin, and made the interesting discovery that the unfrozen water contained 90 per cent. more bacteria than the ice; but it is only fair to say that the Dora is highly polluted and might be called a sewer without doing it injustice as a river; also, that the river water was tested in its natural condition, while that from which the ice was made had been purified by filtration. Tests in this country, made with Merrimac River water, showed that freezing may, and usually does, reduce the number of bacteria in water, but in no instance did they show that sterilization had been effected. Prudden, in 1888, in tests of Hudson River ice, went into the subject very carefully and with every safeguard against erroneous conclusions. He classified the bacteria, and found, as might have been expected, that some varieties were much more susceptible to the influence of cold than others. Unfortunately, those which are probably harmless seem to be least able to resist, and by complete freezing may be exterminated. Some, at least, of the pathogenic varieties developed surprising toughness. The typhoid bacillus, for example, resumed business after the manner of its kind, after being kept imprisoned in ice for about four months. Macfayden more recently had opportunity to work with much lower temperatures than had been previously available. He froze culture media containing the bacilli of typhoid, diphtheria, cholera and anthrax first to —190° C. with liquid air, and then to —250° C. with liquid hydrogen, and naïvely reports that "no impairment of their vitality or the slightest alteration of their structure could be observed." Swithinbank tried like experiments with the bacillus tuberculosis in liquid air at —190° C. from six hours to six weeks, and in every instance they gave in inoculations the same results as unfrozen bacilli of the same variety. Tests by Belli, at the University of Padua, with bacilli frozen in liquid air, seem to show that about the only change exhibited in the more resistent kinds is that while frozen they do not multiply, but when thawed out again they make up for lost time, and are no less dangerous than before. That no artificial protection might be charged from the latent heat of the culture media, Dr. Belli cultivated colonies of pathogenic bacteria on strips of test paper. These were hung in liquid air, and after eight hours the bacilli came out as lively as ever, and as dangerous.

The latest tests available are those of Dr. Jackson, chemist of the department having control of the water supply of New York, of samples of the Hudson River ice crop of the present winter, cut for the New York City supply. Twenty-five samples were reported on. None of these were sterile, but some were a good deal worse than others. Eleven were rated as good, because relatively low in bacteria; five are classed as slightly contaminated, five as contaminated and four as bad. The "bad" samples showed from 12,000 to 21,000 bacteria per cubic centimeter. Most of the samples revealed intestinal germs, indicative of sewage pollution. Not all of these are necessarily highly dangerous, but they are at least danger signals, and are usually found in water liable to be charged with the typhoid germ if any cases of that disease are present in the communities furnishing the sewage pollution. Dr. Jackson made no attempt to segregate the several groups of bacilli, which is to be regretted. His results show, however, that a great deal of ice is being cut at points along the river which are "highly contaminated," and also from points, as between Albany and Troy, where the crop is "solidified sewage."

This is but a hasty summary of the voluminous literature of ice investigation in bacteriological laboratories. It is, however, a fair and impartial summary. It leaves no room for doubt that ice may be extremely dangerous as an addition to food or drink. This is not likely to be intelligently disputed, the discussion hinging upon whether it can be shown beyond question that any epidemic of typhoid fever or other disease has had its origin in impure ice, and

whether the danger is as great as many advanced thinkers believe.

To answer this question frankly involves the admission that in the causation of epidemics nothing is provable. The most that can be looked for is circumstantial evidence. By the process of exclusion, which eliminates the least probable among the possible causes, we narrow the investigation until suspicion centers upon the most probable of the possible causes. With this we must be satisfied, even tho it leaves an opening for the contention that the attribution is pure assumption. This is not quite true, as the rule, but it serves the purposes of those unwilling to be convinced. Several fatal epidemics are intelligently attributed to impure ice on circumstantial evidence, which carries conviction to every open-minded student. The first of these critically investigated was that at Rye Beach, New Hampshire, in 1875. In that instance, the only discoverable cause of an infectious intestinal disorder a good deal like typhoid was ice from a pond of impure water. The memorable typhoid epidemic at Plymouth, Pa., in 1885, had its beginnings in a case traced unmistakably to polluted water, and spread by secondary infection from dejecta thrown upon snow. The most conspicuous European case was that in the barracks at Rennes in 1895. How many sporadic cases have occurred in cities from impure ice, which have been checked before assuming the character of epidemics, can never be known. Judged in the light of experience, it may be concluded that the danger of widespread typhoid infection from impure ice is less than might be expected from the number and hardiness of the microorganisms it carries, but in this matter experience is not a safe guide. It should be remembered that each year is likely to increase the pollution of streams and ponds which receive drainage. As population grows the water consumption and sewage waste increase. Modern plumbing seems to be based upon the exploit of Herakles, in cleaning the Augean stables by turning the River Menios thru them. It deals with floods of water, and recalls the old couplet about Cologne and the Rhine, to the effect that while the river might wash the city, the question how the river shall be washed in turn remains unanswered.

From the facts above presented the thoughtful reader may draw certain safe conclusions. These may be summarized as follows:

Ice formed by the freezing of impure water is likely to be impure.

If this water contains pathogenic bacteria, enough of these will survive protracted freezing to be dangerous.

Whether ice is safely pure or unsafely impure can only be told by tests, which for the householder are impracticable of application.

Past immunity from evil consequences, while a cause for thankfulness, does not prove that conditions lacking last year may not exist this year.

To permit to mix with food or drink the water of melting ice of unknown quality as to purity is less safe than to use ice for cooling by external application to vessels containing the food or drink which it is desired to cool.

That the almost characteristically American habit of copious ice-water drinking is attended with risks other than those pointed out in most textbooks of hygiene.

That, while the admitted facts of ice pollution do not furnish a sufficient basis for a popular panic, they are of enough importance to warrant such safeguards against the sale of dangerously polluted ice as are everywhere deemed necessary for the protection of the public against impure water.

New York City.

Music, Art and Drama

Grand Opera

As the opera season approaches its end the indications are that Mr. Hammerstein will not produce three of the operas on his list—"Lohengrin," "Masaniello" and "Hélène." One can easily understand why the Wagner opera should be deferred until next season, when the manager of the Manhattan expects to be more fully equipped in that line. In place of "Masaniello" we have had "Fra Diavolo," by the same composer; and as for "Hélène," Mr. Hammerstein doubtless relies on the promise made by Saint-Saëns that he will return next year, in which case the production of his opera will be attended with additional *éclat*. Melba will be here again to assume the title rôle.

There is reason to think that Mr. Conried also expects to produce a Saint-Saëns opera next season — probably "Henry VIII." He has announced that he intends to bring over a famous opera composer, but has not disclosed the name. Possibly he has in mind Saint-Saëns or Massenet, several of whose operas have enjoyed considerable favor here—or maybe Strauss.

Undoubtedly it is good policy to import composers. The public dearly loves personality, and even if the composer does not "personally conduct" his works, his mere presence serves to stimulate attendance and enthusiasm. This was shown in the case of Puccini, who apparently had the time of his life here. The newspapers did not make much ado about him, but he was tumultuously called for and applauded at every performance of his operas, and these performances have been very frequent.

Puccini is eager to write an opera on an American subject—ye playwrights, take note! Mr. Belasco has already promised to submit a plot to him. The work is practically sure of success; Puccini does not, like Mascagni, shake operas out of his sleeves, but writes them carefully, and he is at present so popular—particularly in New York and London—that anything from his pen will go. His operas are the equivalent of the "best sellers" in the fiction market. Much of their success is due to the fact that all of them are based on successful plays —"Manon," "Tosca," "La Bohême," "Madama Butterfly"—and it is therefore unlikely that he will venture on untried soil. He enjoyed "The Girl from the Golden West," but it did not seem to offer him any musical opportunities.

Apparently the suppression of "Salome" at the Metropolitan made a deep impression on Puccini. It caused him to give up a certain French play he had had in mind for his next libretto. As for the ostracized Strauss opera, the plan of producing it in Boston and Chicago was given up for three reasons: The fear of public protests, à la New York; the expense of the large orchestra needed, and the disinclination of Mr. Dippel to learn the part of Herod, Mr. Burrian having returned to Dresden. Mr. Dippel is ready for almost anything, but he drew the line at learning for only two or three performances a rôle so written against the grain as Strauss's are.

Madame Fremstad remarked to a

friend the other day that when she first began to learn the part of Salome she was simply furious at its unnatural intervals. She added that even after she had mastered it her feelings were less like artistic gratification than like the sense of triumph a circus athlete must feel after accomplishing some daring athletic feat.

Mr. Conried has expressed his determination of producing "Salome" next year, with certain changes that will eliminate the most objectionable features. He also promises to produce another Strauss opera, "Feuersnot," both of them under the composer's direction. Beyond this he has not yet disclosed his plans for the future.

What with Puccini and Caruso, the Italians have had things pretty much their own way at the Metropolitan of late. The last weeks of the season are, however, being devoted to the four operas constituting Wagner's "Ring of the Nibelung." "Parsifal" has its second hearing on March 29th. The first attracted one of the largest audiences of the season. There has been some foolish talk in the newspapers of a decline of interest in German opera. As a matter of fact, the only performances that draw larger audiences than the German ones are those in which Caruso appears. It is not a question of opera, but of singer. When Jean de Reszké was the idol of the public it was the Wagner operas that drew the record audiences. Without Caruso, half of the operas in which he sings would not fill a hundred seats beyond those occupied by subscribers.

An occasion of special rejoicing was the return to the Metropolitan of Madame Schumann-Heink after an absence of three years from the Metropolitan. She remains the greatest of operatic contraltos, and her glorious voice has not suffered from her ill-advised comic opera experiment. It is to be hoped she will hereafter remain in her proper sphere.

There are some things in which Mr. Conried has shown better judgment than his predecessor. One was the production of "Parsifal," the greatest operatic success ever recorded in America; the other, the addition of Humperdinck's "Hänsel and Gretel" to the Metropolitan repertory. Mr. Grau doubted that New York would take to this fairy opera, but that was where he made the mistake of his life. It had, last year, more repetitions than any other opera on Mr. Conried's list, and it has maintained its popularity, especially as a matinée opera for children of all ages. Unfortunately, the delightful Gretel, Miss Bella Alten, goes to Berlin next season. Favorable reports are being printed of Humperdinck's new opera, "Bübchen's Weihnacht's-Traum" ("The Boy's Christmas

ELSA RUEGGER

Dream"); perhaps Mr. Conried will give us that, too.

Mr. Hammerstein's opera season has undoubtedly injured the Metropolitan to some extent; on nights when Caruso does not sing there is an appreciable loss, especially in the gallery and the standing room. Mr. Conried, backed up by his millionaires, has naturally tried to checkmate his rival by getting away some of his best singers. Both managers now claim that Bonci is theirs, and the matter is to be settled in the courts. Mr. Hammerstein, no doubt, showed excellent judgment in the selection of his singers, so far, at least, as the men are concerned. He knows now that his prima donna list was weak, and is preparing a much stronger one for next season, which will include Mmes. Nordica, Schumann-Heink and Calvé; the last named also sings eight times this season. There will be genuine German opera at the Manhattan. By bringing over Bonci, Basso, Renaud and Sammarco, Hammerstein taught the lesson that there were capital artists abroad unknown to New York audiences, and he promises further surprises for the future. He is a musician himself, and knows the good and bad points of all his singers. One of his most commendable deeds has been the bringing back to the stage of the admirable Mr. Gilibert, who has lived in New York for some years, and whose absence from the Metropolitan has been inexplicable.

Having no German operas in his present list, Oscar Hammerstein finds it a little difficult to secure a sufficiently varied repertory. There are really surprisingly few operas that the public cares for, and the favorites of a former generation do not appeal to the public of today. Mr. Hammerstein has experienced the truth of these remarks of late in a somewhat unpleasant manner. Within the last few weeks he has revived three old favorites—"Un Ballo in Maschera," "Dinorah" and "Fra Diavolo"; but only the last named proved a success, altho they were all well sung and staged. It must be admitted that "Un Ballo in Maschera" is not one of Verdi's best operas; but "Dinorah" contains some of Meyerbeer's choicest music, yet it was heard by only a handful of people. Auber's "Fra Diavolo," fortunately, had better luck. Its delightful tunes, well sung, and its funny plot, amusingly acted, found immediate response, and the indications are that this youthful opera at the age of seventy-seven has been restored to the regular repertory.

What is more, Mr. Hammerstein has announced his intention of devoting his repertory next winter largely to French operas of the class to which "Fra Diavolo" belongs. He promises Massenet's "Manon," which is familiar here, and two very interesting novelties—Charpentier's "Louise," which has for years been a favorite in France, and Debussy's "Péleas et Melisande." He is considering the plan of giving performances in other American cities. He will drop some of the older Italian operas and produce Weber's "Freischütz" and at least three of Wagner's operas, to be sung in French. He has engaged for his French performances two of the leading singers of the Opéra Comique in Paris, M. Perier and Mary Garden. Thus, to some extent, there will be a division of labor between our two opera houses—light opera at the Manhattan and the more dramatic works at the Metropolitan.

Solo and Orchestral Concerts

If our review this month is devoted almost entirely to the two opera houses, that is because there has been little to chronicle and discuss apart from the performances given at the Manhattan and the Metropolitan. New York has become opera-mad, and concert givers for the time being have to take a back seat.

Soloists have been few and far between. Some of their concerts have presented a conjugal aspect. Record has been made already of a recital by Mr. and Mrs. Petschnikoff. More recently, Mr. Lhévinne arranged a concert at which his wife also played; she, too, is an excellent pianist. The young American violinist, Francis Macmillen,

gave a concert with the eminent Belgian violoncellist, Miss Elsa Ruegger, who had previously played at a Philharmonic concert. On both of these occasions she maintained her reputation as the best performer of her sex on her instrument. She is far from being a merely brilliant player, which is fortunate, for no instrument is so unsatisfactory as the violoncello when used as a mere medium of display. She subordinates virtuosity to beauty of tone and the expression of sentiment.

Mr. Walter Damrosch's New York Symphony Orchestra has been reorganized and enlarged to ninety-five players. It starts soon on a tour of the South and Middle West. Next season this organization will give eight Saturday evening and twenty Sunday afternoon performances.

The last Philharmonic was devoted to Haydn and Beethoven. At the preceding concert, Mr. Safonoff gave much pleasure by a revival of Mendelssohn's Italian symphony. The Philharmonic

Josef Lhévinne's last concert in New York was the seventy-fifth he has given in this country since last November. Before the end of the season his appearances exceeded one hundred by five—a record figure.

The Kneisel Quartet continues to draw audiences which more than fill Mendelssohn Hall. Unfortunately, the admirable violoncellist of the Quartet, Mr. Alvin Schroeder, returns to Germany in the spring to remain there.

has had the most prosperous season in its history. An extra concert is to be given, at which Mr. Safonoff will conduct the two works with which he has so far made the deepest impression—the Tchaikovsky "Pathetic Symphony" and the "Tannhäuser" overture. Mr. Lhévinne will make the occasion more notable still by playing the Rubinstein concerto, with which he made such a sensation at his first New York appearance last year.

Art Notes

The March calendar of art events in New York has listed several interesting private exhibitions, at which at least one

PORTRAIT MEDALLION OF MADAME ERNEST RAYNAUD.
Executed in Paris, 1901.

memorable canvas was shown. Our splendid colorist, John LaFarge, gave us the chance to see his ultimate rendering of a subject which attracted him many years ago and which he has before rendered in water-color. "The Wolf Charmer" he calls this beautiful piece of weird suggestiveness of superstition and savage power, and in a composition that gives us certainly both of those requirements of Berenson's for a great figure picture—"tactile values" and movement—we see a bestially primitive man striding forward with watchful cunning and fanatical intensity of belief in his own power over the horrible beasts that crowd after him. The man knows that to lose faith in his music would be to die. The beasts are not tamed out of their savage instincts in any way, and the whole effect of the movement and of the color in which the masses are enveloped—vibrating bluish tones—is to produce in us terror of untamed, fundamental savagery. Mr. LaFarge has called forth all his great knowledge for the production of this great work, and, as in all his final things, loses himself in absorption in his subject. How he has gleaned his store of memories of color one can gather to a slight extent in a view of the studies and sketches shown with "The Wolf Charmer" at Montross's. They are records of visits to Japan, Samoa, Tahiti, Fiji and Hawaii. Studies of color and form and unusual movement, mostly in water-color, and covering many years. It is one of the crying shames of our time that no great commission for a decoration in a public building in New York has been given to LaFarge. His beautiful "Ascension" in the Tenth street church, done so many years ago, may remain to

OBVERSE OF CENTENNIAL MEDAL OF THE NEW YORK HISTORICAL SOCIETY.
Executed in New York, 1904.

us the only adequate expression of his genius.

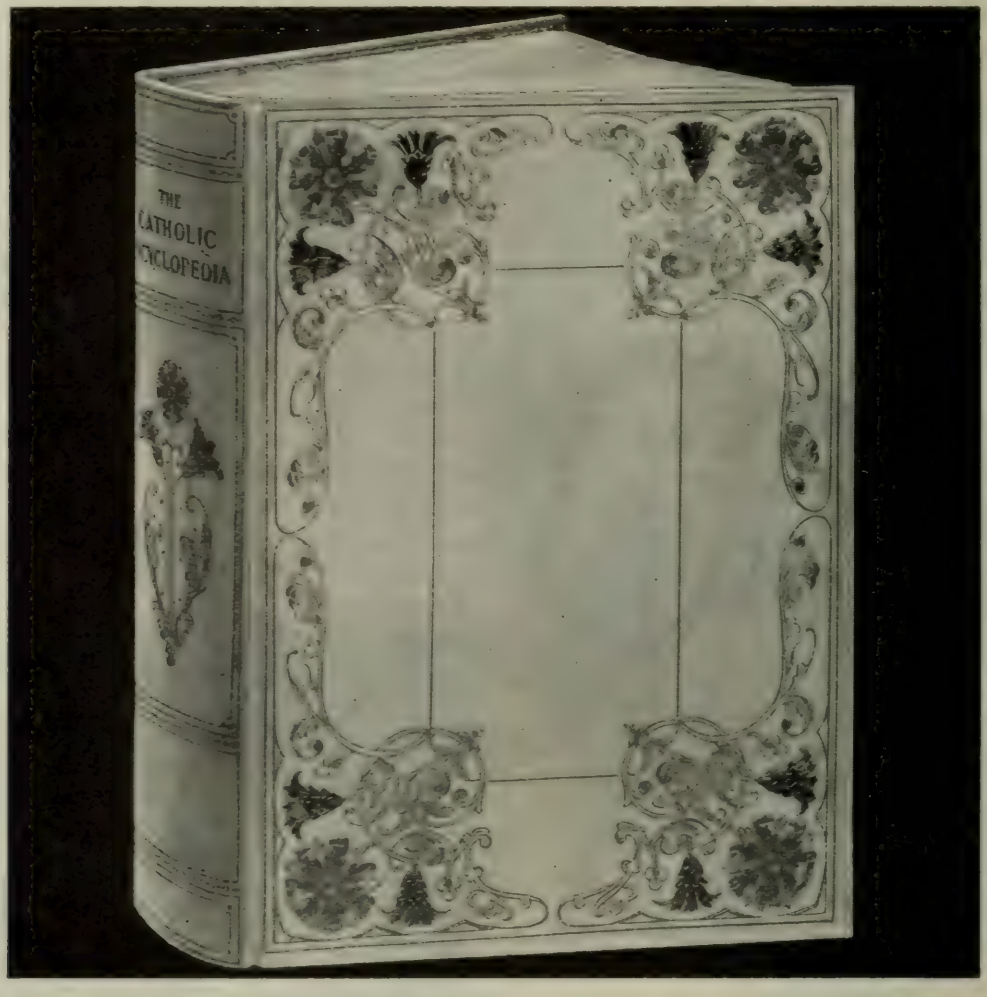
The recent portraits by J. J. Shannon, shown at Knoedler's, are very uneven in merit, but on the whole less errant on the score of taste than many he showed us last year. The portraits of Mrs. Frederick Pratt and Mrs. John Pratt are almost up to his best work. The portrait of Meredith Pyne with his collie dog is a notable arrangement, with a rather splendid air of distinction and much harmony of colors. This year he has no bothersome groups to arrange, and his successes in posing single figures are always more notable. He slights his hands and often pays little attention to construction in the figure, but when his decorative color schemes are pulled together by the quieting hand of time the possessors of most

of these portraits will have delightful pictures.

Mr. Macbeth this month shows us nineteen strong portrait canvases from the brush of Ellen Emmet. Always as yet a little brusque in her manner of approaching a character, her sincere realism is a relief after the stylistic painter's work. Unlike Shannon, she will not be sought out to portray clothes and settings. She will paint men solidly and with increasing insight, and, judging from at least three canvases here, she will attain to greater beauty of color than she can now be said to be mistress of. The most complete portraits in the exhibition might be said to be those of Mrs. Goodrich and Augustus St. Gaudens. The most charming—and charm is not one of Miss Emmet's characteristics usually—the portraits of the boy "Grenville" and

SEAL OF THE NEW YORK PUBLIC LIBRARY.
Executed in New York, 1903.

the girl "Eleanor," the most interesting in study type perhaps that of young Mr. Joseph H. Choate, Jr., but all the work is so downright honest that it is refreshing.



A. W. Drake's famous collection of brass and copper has been dispersed. It was on exhibition at The American Art Galleries for several days preceding the sale, which took place on the afternoons of February 25th, 26th, 27th, March 1st and 2d. It attracted many buyers, including the Metropolitan Museum of Art, and took on the nature of a social function. The gross receipts from the sale were $34,152. Mr. Drake began collecting many years ago, and never lost his enthusiasm over a good bit of brass or copper. His purchases were made with discrimination, and as a result the collection went for good prices. One copper water jar sold for $500, the highest price of the sale.

In a comparatively short time, if the news of a change in the designs of our coins be true, the whole American public will have its attention called to a form of art production not usually noticed by any great part of it. The members and friends of the Grolier Club have this month been treated to an exhibition of work of this medallist's art at its best for this time and country—an exhibition of the collected works by the Russian-American, Victor D. Brenner. This exhibition includes about eighty pieces, of which many are portrait plaques and the rest medals and seals of memorial character. Mr. Brenner is only about thirty-five years of age, but has been working at his craft since the age of thirteen, at

PORTRAIT PLAQUE OF DR. DUMONTIER.
Executed in Paris, 1905.

first in Russia with his father, who was an engraver of seals, and after 1890 here, where he studied at night while engraving for a jeweler in the daytime, until 1898, when he went to Paris to study with Roty and at Julian's for two years. Then, after a year of travel, he returned to New York, and has since been producing all the different sorts of portrait work as well as medals. The medallist's art differs from the sculptor's in its resemblance to that of the engraver. Many of modeling in relief on a wax background gives a certain hardness to the outlines and takes away a little from the charm of the portraits. Within the outlines, however, they are most delicately modeled. They are not always as well spaced as those old marvels, the Florentine medals, nor as most Greek coins. As a designer, Brenner does not yet rank with the French medallists of today, but among us he is not yet rivaled. The most beautiful of his portraits is that of

THE VATICAN EDITION OF THE CATHOLIC ENCYCLOPEDIA.
Showing decoration on vellum binding.

of Mr. Brenner's medals are cut directly into the soft steel dies, which are afterward hardened, and into which the metal disks are pressed to take the impression of the design. When he models his designs or portraits that are to be made into medals, he uses a slate background and reduces the original model in a reducing machine of pantagraphic character to the required size. Portraits not so reduced are cast in silver or bronze, but the use of the slate background instead Mr. Samuel P. Avery, perhaps. Those we reproduce give a fair idea of his range.

The Catholic Encyclopedia, as issued by the Robert Appleton Company of 1 Union Square, New York City, in the so-called Vatican edition, is a very elaborate book. The edition is strictly limited to twenty-six copies of fifteen volumes to each set. The binding is in full vellum, with elaborate gold tooling. The books contain hand illuminations,

facsimiles in color, photogravures in tint, and each set is autographed by His Holiness Pope Pius X. The price of this set of books has been fixed at $2,250, with the publishers' privilege to advance the same without notice. The illustration but faintly shows the beauty of the cover design.

The Drama

It would naturally be anticipated that Richard Mansfield's production of "Peer Gynt" would please the Ibsenites because they would have an opportunity for the first time of seeing before them upon the stage the creatures which they had hitherto had to vivify by main strength of imagination, and it would also be supposed that the play would be "caviar to the general" because in this version some scenes are quite incomprehensible without their excised context. Curiously enough the effect of the production is quite the opposite. Those who do not read Ibsen rather take to it, regarding it as a series of beautiful spectacles and admiring Mansfield's make-up in his triple part of youth, manhood and old age. They did not miss the deeper meaning of the apolog, because from what they could see on the stage there was no reason to suspect that there was such a meaning.

No one can find fault with Mr. Mansfield for cutting down the play, since even Ibsen himself sanctioned that, but he has, at the same time, drawn it out so that the play as a whole is nearly as long as it is on the Norwegian stage and yet contains only half as many scenes. In New York City the orchestra playing the Grieg suite deservedly received almost as much applause as the actors, altho the music was not used, as Ibsen intended it should be, to cover the wounds left by the cuts made in the play. Even the Ase's death music was played with the house lights on and interrupted by curtain calls. The drunken Peer who staggers about the stage in the second scene has none of the lovable qualities with which Ibsen endowed him and the audience has therefore no sympathy with Solveig's infatuation with him.

RICHARD MANSFIELD.
As the youthful dreamer in "Peer Gynt."

Mme. Nazimova has returned to the Bijou Theater with a greatly improved cast in Ibsen's most powerful and pathological drama. We have already noticed in this department Mme. Nazimova's "Hedda Gabler" with her earlier support, but the recent substitutions have so improved the play, that now it may be said to be in some respects the best dramatic production given to a New York audience this winter. We need say no more now than that Mme. Nazimova is a really great actress, the part of Hedda a great part, and that no other player that has been seen in the part in New York, not even Mrs. Fiske, has come within hailing distance of her.

It is fortunate

that the Shaw craze has been strong enough to bring upon the American stage at the Herald Square Theater one of his earlier comedies, "Widowers' Houses," for it has a more pertinent and timely interest for us than some of his later plays. The title is obviously of scriptural derivation, but with a Shavian twist. The theme is tainted money and the lesson is that we are all tarred with the same stick. The hero, if the term can be used for a Shaw character, falls in love with a charming heiress, but parts from her on learning that her father has obtained his wealth by rent of foul and diseased tenement houses in East London, but when it is explained to him that his own income is derived from mortgages on these same tenements he abandons his ideals and sinks to the mercenary level of his associates. The play is full of witty hits at all sorts of wickedness and folly, and it is to be hoped that it will take a permanent place on the American stage. It is admirably acted in its present production.

Last season, when an attempt to put Shaw's most "unpleasant" play, "Mrs. Warren's Profession," on the stage in New York, it was suppressed, after one performance, by the police amid great excitement and hot discussion. The second night the street was crowded with people who were willing to pay $10 or $25 for seats. This winter the same play, having been declared unobjectionable by the courts, was again produced, but it failed to arouse any interest in either the godly or ungodly, and was played to a half-empty auditorium. We leave the moral to be drawn by the reader.

The waning interest in the Ben Greet plays seems to indicate strongly that the early success was due largely to the charming personality of Edith Wynne Matheson, who is now no longer connected with the company. In "Macbeth," the part of Lady Macbeth is relegated to third or fourth place in importance, by the weakness of the character carrying the rôle. The attempt to present the play under the original setting and conditions of the Elizabethan stage, altho historically of interest, is somewhat wearying to the audience on account of the monotony of the scenery and the lack of intervals. The educational value of the Ben Greet series is great, because it is only in this way that one can get the Shakespeare plays in their entirety and approximately as they first appeared, but they only emphasize the improvements made in stage management in the last two centuries—improvements that Shakespeare himself, if he lived now, would be the foremost to take advantage of.

Rex Beach's play might be appropriately called "'The Spoilers' Spoiled," because it retains little of the peculiar qualities which made the novel popular. "The Spoilers" was an unusual book, but it makes a very ordinary melodrama. The stage manager has done his part well; there are some beautiful views of Alaskan mountains and fiords, and the fighting is fierce enough to satisfy the most pugnacious spectator, but the acting is stiff and the characters have lost the realism and vitality which were their redeeming features in the book.

"On Parole," by Louis Evan Shipman, is a Civil War drama, but sentimental rather than melodramatic. The shooting is reduced to the minimum and the lines carefully worded so as not to offend either Northern or Southern prejudices. The production is adequately staged and played naturally and quietly, altho the actors show, by their failure to make the most of the aristocratic Southern accent, that they are not to the manor born.

We have already stated it as our opinion that "The Man of the Hour," by George Broadhurst, is the best play of its kind that has been produced in New York this year. Mr. Broadhurst's latest piece, however, entitled "The Mills of the Gods," is a thoroly second-rate production. It sticks as close as glue to all the old threadbare stage conventionalities, and is almost melodramatic enough to suit a Bowery audience. The play was fairly well acted, especially by Mr. Selwyn, who took the part of the villain. It should not have a very long run.

The Czar

BY AYLMER MAUDE

[Mr. Maude is one of the best versed Englishmen in Russian affairs now living. He is a close personal friend of Tolstoy and has translated most of the famous novelist's works and has written much about him.—EDITOR.]

DURING my recent visit to Russia I tried to learn what his subjects think of the Czar. I met men who have conversed with him, but none who share Mr. Stead's view, namely, that the Czar is a firm, well-intentioned ruler, the right man to steer the ship of state. Some still hold an opinion that used to be popular and say that the Czar is personally well intentioned, but is so weak, ill informed and readily swayed by those around him that he seldom manages to give effect to his good intentions. Most people in a position to form an opinion seem, however, to have arrived at the conclusion that, tho he may be weak, he is also obstinate, and clings to autocratic power with Byzantine cunning and with a tenacity that yields to nothing but to fear. He is also said to be extremely superstitious. In his desire to obtain a son and heir he turned first to the French spiritualist, Philippe, and when this man's incantations failed, the Czar groveled on the floor before the immaculate and wonder-working body of St. Seraphim, to whose assistance he attributes the ultimate granting of his wish.

A very competent observer, who plays no small part in the constitutional movement, answered my inquiry as to what he thought of the Czar by saying with emphasis: "I consider him the culprit chiefly responsible for the present state of Russia." That is now a very general opinion.

What Russia needs most is some firm ground on which reforms may be based, and what prevents such firm ground from being secured is the continual and capricious interference of the Czar in legislation and in the administration of the law.

Neither Witte, nor Stolypin, nor any other Minister has been or can be sure of his ground so long as that interference continues. Take, for instance, the amazing case, first mentioned by Prince Ouroúsof in the Duma, and confirmed by Lapoukín's report to Stolypin, which leaked out at the time of the trial of the Workmen's Committee in Petersburg last October.

While Witte was Premier a secret printing press was set up in one of the departments of the Gendarmerie in Petersburg, and officials printed leaflets inciting the people to riot. These were distributed in the provinces by emissaries of the Government. The whole affair was contrary to Witte's wish and policy; yet, in Russia, where men are often shot or exiled to Siberia for offenses far less grave than this, no one has been brought to trial. The only explanation is that the officials who incited the people to riot did so at the wish of certain highly placed personages, who, being under the Czar's protection, are safe from punishment, or even from prosecution.

Administrative chaos must exist as long as the arbitrary wish of one man can override any and every law, and to keep the whole administration in doubt as to whether the Minister nominally in power is the man who must be obeyed, or whether the real power belongs to some one else.

The extraordinary confusion produced by the Czar's personal interference with matters he does not understand was brought home to me almost as soon as I reached Petersburg by the following incident. Dining at the house of a well known publisher, I sat next to T. D. Bátushkof and heard from him the story of the suppression of his monthly magazine, *God's World*, a discreetly

managed publication of good standing. This is what happened: T. D. Bátushkof had written an article blaming the violence practiced both by the extreme Right and the extreme Left, by upholders of the Government on the one side and the revolutionaries on the other. A review of this article, written by a personal enemy of Bátushkof's, appeared in Prince Oúhtomsky's paper, *The Petersburg News,* and in this review opinions which Bátushkof had quoted with condemnation of the violent utterances of extreme revolutionaries were reproduced as tho they were his own sentiments. No sooner had this review appeared than some one hastened to show it to the Emperor, who telephoned to Stolypin to take action in the matter. Stolypin, knowing nothing about it except that the Emperor wished Bátushkof to be punished, telephoned to the Prefect to "arrest the Revolutionary Bátushkof and stop his paper." The Prefect telephoned back, "There is no Revolutionary Bátushkof; that is only T. D. Bátushkof, a man of position, editor of *God's World* and co-editor of the *Journal of the Ministry of Education.*"

As the Emperor was concerned, Stolypin insisted that at any rate the magazine must be stopped and Bátushkof must be prosecuted. The gendarmes accordingly came to the editorial office, searched the premises, stopped the further sale of the magazine, and handed copies of it to the Public Prosecutor for him to indict Bátushkof. The Public Prosecutor, on reading the article of which the Emperor (without having read it) had disapproved, was obliged to say that no prosecution founded on it could succeed; but, anxious to oblige the Emperor, he read up the back numbers of the magazine and succeeded in finding two articles on which he thought some sort of an indictment could be founded.

Meanwhile Bátushkof went to see Prince Oúhtomsky, and asked him what he meant by publishing so unfair a review of an article written by him, Bátushkof, a frequent contributor to the *Petersburg News.*

Oúhtomsky assured him that the article had gone in without his having noticed it; and undertook to publish an apology and also to insert Bátushkof's own explanation of the occurrence. No sooner was this done, than Bátushkof hurried off to have the matter laid before the Czar. To his dismay he found that the latter had just gone yachting for a few weeks, and was not to be troubled with business matters during his cruise!

So, at the time I met him, his magazine was stopped, the prosecution against him was proceeding, and he was quite in the dark as to what was likely to happen. He could make no arrangement with contributors and could issue no announcements for next year, tho it was just the time when announcements ought to have been made to provincial subscribers.

All this was happening just a year after the Czar, in the famous manifesto of October 30th, 1905, had granted freedom of the press to his subjects, and it is entirely characteristic of the way in which Russia is now governed; only it often happens that not the fate of a paper merely, but the lives of men and women, hang on the reckless whim of a man who will not refrain from interfering in matters he does not understand. (I am glad to see, from Russian papers now to hand, *God's World* is again appearing.)

Tho newspapers and periodicals are continually being suppressed, the censorship on books in Russia is now not nearly so severe as it used to be. One finds Kropótkin's books and nearly all Tolstoy's, as well as the writings of the chief Continental socialists and anarchists, publicly sold in Petersburg and Moscow. One booklet, however, the censor had lately been obliged to prohibit, nor, when one reads it, can one feel surprised that he should do so. It is "A Complete Collection of the Speeches of the Emperor Nicholas II," reprinted verbatim from the *Official Gazette.* It would, indeed, be difficult to frame a more damning indictment of autocratic pretensions than is supplied by this little volume. Almost at the commencement stands the Czar's memorable rebuke of the "insensate fancies" of those members of the local governments who, when offering congratulations on his accession to the throne, ven-

tured to hint that it was desirable that representatives of the people should be allowed some share in the preparation of the laws. Further on, we find his speeches during the miserable Japanese war, his expressions of gratitude to the reactionaries, and the book concludes with his decree to the Senate dissolving the Duma.

That the censor should suppress the Czar's speeches is quite in keeping with the topsyturvydom that reigns in Russia. So, too, is the fact that not only the Social Revolutionary party and the Social Democrats, but even the Cadet party (much the largest party in the late Duma) are treated as illegal organizations, and any Government officials joining them are dismissed from their posts, while they are publicly invited to join the "League of Russian Men," which is treated with especial favor and has been repeatedly thanked by the Czar for its loyalty, tho it distinctly rejects the present Constitution of the Empire and clamors for a return to undisguised autocracy. This league has been active in promoting the anti-Jewish *pogrôms*, and one of its Moscow newspapers announced the assassination of Herzenstein, a prominent Jewish member of the Cadet party, some twelve hours before the crime was actually committed.

In the Russian papers just to hand, one reads a telegram from Kazán stating that this "League of Russian Men" is organizing a meeting in honor of the imperial mercy recently shown to one of their number. The man in question murdered a lawyer during the last anti-Jewish *pogrom*, and was sentenced to eight months' imprisonment and to the loss of his civil rights. The Czar, on the principle, no doubt, that there are "limits to human endurance," has reduced this sentence to two months' imprisonment without loss of rights.

The same paper tells of several men hung and of others shot for robbery with violence; but they did not belong to the league which favors the return to undiluted autocracy, and no imperial mercy was shown them.

Many officials in all departments of state follow the Czar's example, and, ignoring the law, issue reckless and haphazard decrees. For instance, in Moscow I made the acquaintance of a student who is a Social Democrat. He was exiled to Minousínsk, in Siberia, for lecturing to groups of peasants, but when he had been there five months he was amnestied. After the Manifesto of October, 1905, he again carried on propaganda among the peasants. At the time he met with no opposition from the police, who did not know what was going to happen, or in how far the liberty of speech promised in the Manifesto was to be observed in practice. In fact, some police officials at that time made speeches much more extreme than his own.

After the Moscow insurrection, in December, however, the reaction set in and he was arrested, and without trial, and without even being charged with any definite offense, he was sentenced by "administrative order" to exile in Northeastern Siberia for five years. The wretched village to which he was to be sent was 9,000 versts (6,000 miles) from Moscow. It was a place where it was impossible to find work and where the lot of political prisoners, left for years to live as best they can among the semi-savage natives, is miserable to the last degree. He was despatched on the long journey with common criminals, exposed to all kinds of dirt, vermin and disease.

When, after some months of slow travel and of prison, he at last reached Irkútsk—having gone 5,000 versts—a telegram came stating that he might be sent back. His sister had succeeded in seeing some highly placed official, who altered the sentence to one of two years' exile abroad at the student's own expense. He might go to Switzerland, America or wherever he liked. On his return to Moscow he was told that he would be sent to the frontier by *étape*—that is to say, he would be marched along with a gang of prisoners and housed in prison at night. Once again private influence was brought to bear, and permission was granted him to travel by rail, provided that he paid his own fare and that of a gendarme who was to accompany him. Next, permission was asked for him to be let out for two days to bid good-bye to his family, he having been arrested suddenly and no opportunity having been allowed him to arrange his affairs. This request, too, was granted;

and in reply to the inquiry whether it would matter if he stopped out rather more than two days, he was told that it would not matter.

When I met him he had been out about a week, and had no intention of surrendering till he should be arrested.

One could give any number of instances of the reckless, irresponsible way in which Russia is governed, and it all hinges on the Czar's autocratic power, which is fatal to real reform.

What Russia needs first of all is some clear and definite rule of law, and the public trial of officials who infringe the law. This is unattainable so long as a capricious Autocrat interferes in public affairs. That is why the state of Russia is going from bad to worse, and why year by year it drifts nearer and nearer to a terrible revolutionary catastrophe, which threatens to destroy the very bases of civilization. To rid itself of the Autocracy Russia has to risk national suicide, but more and more Russians are coming to feel that the Autocracy poisons all that makes life worth living.

LONDON, ENGLAND.

Strawberries

BY COUNT LEO TOLSTOY

IT was a hot June day. The air was still. The foliage of the forest was shining, thick and green. Rare were the yellowed leaves that fell from the birches and the lindens. Odorous flowers enameled the eglantine thickets; the clearings were carpeted with lucem; the wheat, thick, bending, undulating was ripe to bursting.

In the fields, the moor-hen cried. In the oats and the barley quail whistled and disported by turns. The nightingale in the wood emitted only an occasional trill. The heat was dry. The dust on the roads was a finger deep where undisturbed and, under the slightest whiff of wind, it rose in dense clouds which drifted sometimes to the right and sometimes to the left.

The peasants are completing their buildings and hauling manure; the hungry cattle are waiting under the burning sun for their provender; the cows and the young calves accompanied by the cowherds are hurrying to their stables switching their tails. Small boys are guarding the horses on the roadsides. Women are dragging sacks of grass pulled in the woods. Little girls and maidens race together to the thickets where nestle the strawberries they will sell to the city people who have come into the country for the summer. These last, who occupy villas of pretentious architecture, are either strolling under parasols in light, elegant, costly costumes along their graveled walks or they are sitting in the shade of groves which are fitted with tables, and, overcome by the heat, are drinking tea or cooling beverages.

Near the superb villa of Nicolas Sémionovitch, adorned with a tower, a veranda, little balconies, a gallery—all fresh new and spick-and-span—stands a carriage drawn by three horses wearing bells, which, for fifteen roubles the round trip, has brought a gentleman from St. Petersburg. This gentleman, a politician, tolerant, very much in view, who serves on all the committees and all the commissions, who composes with great tact the memorials to the Sovereign and who calls himself a faithful subject, this gentleman has come to pass the day (for, as an exceedingly busy man, he never gives more than a day) with his friend, a playmate of his boyhood, and almost of the same party. They differ only regarding the manner in which constitutional principles should be applied.

The St. Petersburgian is first of all a European with a slight penchant for socialism. He draws enormous salaries in the positions he fills. Nicolas Sémionovitch, on the contrary, is a true Russian,

orthodox, somewhat Slavophile and possesses several thousand *deciatines* of land.

They have dined in the garden; they have been served a dinner of five courses; but, by reason of the heat, they have eaten almost nothing, so that the pains of the cook, who receives forty rubles a month, and the labor of his scullions, who have been particularly zealous out of respect for the guest, have practically gone for nothing. These diners have relished only the cold soup, the fresh salmon and the parti-colored ices, attractive in form, ornamented with filaments of sugar and surrounded by tiny cakes.

The other diners were the physician, a very liberal man; the tutor of the children; a student, a fierce revolutionary socialist whom only Nicolas Sémionovitch can hold in check; Mary, the wife of Nicolas Sémionovitch, and the three children, of whom the smallest did not appear until the dessert. The dinner was a trifle dull; first because Mary, an excessively nervous woman, was anxious about the stomach of Goga (the pet name of Nicolas, the youngest child), and, secondly, because the moment the conversation touched on politics, the student, in order to show that he was not afraid to express his opinions before anybody, took part in the conversation; thereupon, the guest became silent and Nicolas Sémionovitch endeavored to calm the revolutionist.

They sat down to the table at seven o'clock. After dinner, the friends installed themselves on the veranda and sipped, as they talked, white wine diluted with iced mineral water.

Their first disagreement was over the methods of elections: Was indirect representation to be preferred or not to be preferred to universal suffrage? They were debating very warmly when they were called into the dining-room (protected against flies by muslin screens) for the tea.

During the serving of the tea, the conversation became general. Mary was scantly interested in it, all absorbed as she was by the signs of the derangement of Goga's stomach.

They talked of painting. Mary attempted to prove that there is in the decadent school an indefinable but undeniable something. At the moment, she was not even thinking of decadent painting; she was merely repeating what she had said many times before.

For the guest, the subject was totally devoid of interest, but he had heard decadent painting ridiculed and he talked about it with such a display of knowledge that no one would have suspected him of being indifferent, not only to the decadent school of painting but to every other school.

Nicolas Sémionovitch knew by the look of his wife that something was troubling her, and he feared some sort of a disagreeable scene. Besides, it did not amuse him to assist at the dismemberment of what she had said already a hundred times.

The splendid bronze chandelier was lighted in the dining-room and Venetian lanterns in the court. The children were sent to bed after the little patient had been worked over a trifle.

The guest, Nicolas Sémionovitch, and the doctor went out on the veranda again. The valet brings candles fitted with little shades, mineral water and wine, and toward midnight the conversation begins to grow animated. They asked each other what measures the Government ought to take at this highly important turning-point in the history of Russia. The guest and the host did not cease for a moment to talk and smoke.

Outside, near the *porte-cochère,* might be heard the tinkling of the bells of the harnessed horses, which had not been fed, and the movements of the old postillion, who now yawned and now snored. This postillion had worked more than twenty years for the same employer, and sent all his wages to his brother in the country except the three to five rubles he spent for drink.

When from several quarters the cocks began to call and challenge each other, the coachman awoke and began to ask himself if he had not been forgotten. He descended from his seat and entered the villa. He perceived his passenger seated, eating something, and talking between the mouthfuls. He did not dare to show himself, and went in quest of a valet.

The valet, in livery, was sleeping in the

chair in the hall. The postillion woke him. The valet, an ancient serf, who supported by his earnings (the place was advantageous; fifteen rubles per month and about a hundred rubles in fees a year) his numerous family—five girls and two boys—jumped up, shook himself, stretched, and went to tell his master that the postillion was getting nervous.

When the valet approached the talkers, the discussion was in full swing. The doctor, who had joined the group, was taking part in it also.

"I cannot admit," said the guest, "that the Russian people ought to develop along other lines. What is needed, before anything else, is liberty, political liberty . . . the greatest liberty . . . the safeguard of the rights of the others . . ."

The guest felt that he was getting sadly tangled, and was not saying what he meant to say, but in the heat of the discussion he could not find the right words.

"Without doubt," said Nicolas Sémionovitch, who was not listening to his interlocutor, being solely intent on expressing the thought which lay close to his heart, "without doubt . . . but the end can be reached by another path, not thru a majority vote, but by a general agreement. Look at the decision of the *mir* . . ."

"Ah, this *mir!*"

"It cannot be denied," said the doctor, "that the Slavic race is peculiarly constituted. I would not affirm, for instance, that the Polish right of veto is the ideal . . ."

"Permit me to finish my thought," said Nicolas Sémionovitch. "The Russian people has special qualities. These qualities . . ."

He was interrupted by the arrival of the servant, who approached with his eyes half open.

"The coachman is getting uneasy," said the valet.

"Tell him that I am going to leave soon, and that I will pay him for his time what is proper."

"Very well, sir."

The valet withdrew, and Nicolas Sémionovitch was able to continue the development of his idea. But the guest and the doctor had heard it a score of times already (at least, so it seemed to them), and they began to contradict him, especially the guest, by citing examples drawn from history. He was exceedingly well versed in history. The doctor sided with the guest, whose erudition he admired, and he was enchanted to have made his acquaintance.

The conversation ran on. The dawn began to appear behind the wood on the other side of the road and the nightingale to sing; and still the group continued to smoke and talk, to talk and smoke. They would be talking yet, perhaps, if the chambermaid had not appeared.

She was an orphan, who, to earn her living, had been obliged to enter domestic service. She had served first in the house of a merchant. One of the employees had seduced her and she had become a mother. But her child died. Then she entered the service of a functionary, whose son, a collegian, had allowed her no peace. Finally she had entered as second chambermaid the service of Nicolas Sémionovitch, where she was happy. Here her wages were paid her regularly and she had a safe home.

She came to say that Madame desired the doctor and Nicolas Sémionovitch.

"What is the matter?" demanded the latter.

"Nicolas Nikolaievitch is not well," replied the chambermaid. (Nicolas Nikolaievitch was Goga, who had overeaten the strawberries.)

"Well, in any event, it is time to go," said the guest. "Look, it is daylight. We have parted well," he added, smiling, content with himself and with his companions, who had permitted him to talk so much and so long. And he took his leave of them.

The valet, dragging his benumbed legs with difficulty, had a long hunt for the guest's hat and umbrella, which had been mislaid in some corner or other. The valet counted on a good fee, but the guest, always very generous, being in the habit of giving at least a ruble, worn out by the conversation, forgot all about the fee, and it was not until he was on his way that it occurred to him that he had not given anything to the valet. "Bah! so much the worse!"

The coachman mounted his box,

picked up the reins, seated himself to one side, and the carriage moved away. The bells tinkled and the St. Petersburgian, gently rocked by the highly elastic springs, mused on the poverty of ideas and the narrowness of his friend.

Nicolas Sémionovitch, who did not immediately join his wife, thought the same thing. "This Petersburgian narrowness is frightful! They cannot shake it off!" he said to himself.

He did not hurry to go to his wife, for he foresaw trouble of some sort.

Strawberries were at the root of all the trouble. Some of the village children, the afternoon before, had brought some to the house, and Nicolas Sémionovitch, without bargaining, had bought two platesful of the fruit, which was not very ripe. The children had run up to him at once and had eaten all the berries. Mary was in her room at the time, and when she learned that strawberries had been given to Goga, she was very angry, since the child's stomach was already out of order. She began heaping reproaches on her husband, who retorted in the same tone, and the result was almost a quarrel.

The wife, wearing a wrapper of flowered silk, of which she was very fond, but to which she gave scarcely a thought now, was in the children's room; she was holding a candle for the doctor, who, with a very grave air, was examining the child.

"Yes," she exclaimed, in an important tone, "it is those accursed strawberries!"

"Why, precisely strawberries?" queried Nicolas Sémionovitch timidly.

"Why? You gave them to him to eat, and I have been up all night with him and the child is going to die!"

"No, he will not die," said the doctor, smiling; "a little bismuth and all will be well. We will give him some right away."

"He has gone to sleep again," said she.

"Well, then, no bismuth. I will come tomorrow."

"Thank you."

The doctor went away, but it was long before Nicolas Sémionovitch succeeded in calming his wife. When he finally got to sleep, it was already broad day.

* * * * * *

At almost the same hour the peasants and the children of the neighboring village were returning to their homes, after guarding the cattle all night. Some were on horseback; others led their horses by the bridle, while the colts ran behind.

Taraska Régounor, a barefooted boy of twelve years, in a short pelisse and a cap, mounted on a mare and holding by the bridle a gelding bay like his dam, was galloping toward the village ahead of all the others. A black dog ran gayly before the horses, turning round often to look at them. A young bay stallion pranced proudly, kicking out now to the right and now to the left. Taraska, arrived at his *izba,* hitched the horses near the door and entered the hall.

"Ohé! Still sleeping!" cried he to his sisters and to his brother, who slept on the floor in the hall. The mother, who slept with them, was already up to milk the cow.

Little Olga jumped up, shook out with her two hands her towsled blonde mane, and Fedka, who was sleeping beside her, her head buried in a pelisse, rubbed her eyes.

The night before the children had decided to go strawberrying, and Taraska had promised to wake his sister and his little brother as soon as he returned from his night watch, and he had kept his word. During the night, sitting at the base of a thicket, he had fought against sleep; but now he was completely awake and was eager to be off at once with the other children strawberrying. His mother gave him a pitcher of milk. He cut himself a piece of bread and sat down to the table to eat.

When, clad only in a shirt and a pair of pantaloons, he started with long strides up the road (leaving behind him the tracks of his bare feet, which mingled with other similar tracks, bigger or smaller than his own, with the toes plainly imprinted), the red and white spots of the clothes of the little girls standing out against the fresh verdure of the wood, were already to be seen in the distance. (The night before, each

one had made ready a little basket and a jar, and without wasting any time, without even stopping to take bread, after making two signs of the cross, they had set out.)

Taraska joined them in the great wood soon after they had left the road. Everything was covered with dew—the grass, the bushes and the lowest branches of the trees. The bare legs of the little girls, drenched and chilled by the dew, were soon warmed by their walking, now on the humid grass and now on the dry soil. The strawberries were especially abundant in the coppices. The little girls entered first the coppice of the preceding year. Here, where the grass, not very high, mingled with the young shoots, the strawberries lay hidden—whitish, pinkish, and, in spots, completely red. Squatting on the ground, the little girls picked berry after berry; and with their tiny brown fingers they put the least perfect ones into their mouths and the rest into their baskets.

"Olga, here are heaps of them! You wouldn't believe it!"

"No, no! You're wrong!"

"Aou!" cried from time to time the children, hidden from each other by the thickets.

Taraska went off by himself to a coppice on the farther side of a ravine consisting of young walnuts and planes, which were already as tall as a man. The grass there was ranker and thicker and the berries there were bigger and juicier than elsewhere.

"Groushka!"

"Aou!"

"And the wolf!"

"What wolf? Why do you frighten me? But I'm not afraid!" answered Groushka, and, troubled by the thought of the wolf, she ate berry after berry—and the best.

"Taraska has gone into the ravine. Taraska! Aou!"

"Aou!" answered Taraska from the ravine. "Come here!"

"We are coming. Over there, there are more."

And the little girls went down the bank of the ravine, holding on by the sapling twigs. On the other side they found a clearing studded with strawberries. Quickly they became silent, so as to work better with their hands and mouths. Suddenly they heard a rustling, which appeared to them something terrible to them in the midst of this silence, and they saw the grass and the twigs tremble. Groushka was wild with fright, and spilled half of the berries she had picked.

"Mamma!" she shrieked, beginning to weep.

"It is a hare! A hare, Taraska! A hare! There it is!" cried little Olga, pointing to a brown back and a pair of ears half hidden by the grass. "What is the matter with you?" she demanded of Groushka when the hare had disappeared.

"I thought it was the wolf," answered Groushka, passing quickly from fright and tears to a joyous laugh.

"The wolf! You are a stupid!"

"I had a blue fright!" said Groushka, bursting into a laugh sonorous as a bell.

They picked all the berries there and moved on. The sun was already up; it covered the verdure with brilliant spots or with shade, and made the dew, with which the little girls were now drenched to the waist, glisten. They were near the further edge of the forest, but they kept moving on in the hope of finding more strawberries. All of a sudden, from several directions at once, came the "Aou!" of a band of women and girls who had come out from the village later than they in search of berries. At the lunch hour the baskets and the jars were already half full.

The little girls met there Akoulina, their aunt, who was also out strawberry picking. Behind Akoulina trotted, on his big, bandy legs, a very little boy with a big belly, who was bareheaded and whose only garment was a shirt. "He is always clinging to my heels," said Akoulina to the little girls, taking the youngster in her arms. "I have nobody to mind him."

"We were frightened just now by a hare—a big one; he ran away. You ought to have seen him."

"Ah! ah!" said Akoulina. Then she put the child down on the ground again.

Soon the little girls left Akoulina and resumed their picking.

"Now we will rest a litttle bit," said

Olga, sitting down in the thick shade of a walnut tree. "Oh, how tired I am! Why didn't we bring some bread? I would be glad enough to eat some now."

"So would I," said Groushka.

"Why is Aunt Akoulina calling so loud? Do you hear her?"

"Aou! Aunt Akoulina!"

"Aou!" answered the aunt.

"What is it?"

"Isn't the little boy with you?" called Aunt Akoulina from the direction of the ravine.

"No."

Immediately after the branches parted noisily for the passage of Aunt Akoulina herself, her skirt tucked up above her knees and her basket in her hand.

"You haven't seen the little boy?"

"No."

"But this is terrible! Miehka!"

"Mi—i—i—i—ieh—ka!"

No answer.

"Ah! What a shame! He has gone astray! He will be lost in the big wood!"

Olga jumps up quickly and runs off with Groushka to look for the child on one side of the wood; Akoulina takes the opposite direction. Incessantly she called "Miehka!" in sonorous tones, but no one answered.

"I am tired," said Groushka, lagging behind.

But Olga ran, without stopping, now to the right, now to the left, looking everywhere.

The voice of Akoulina became fainter and fainter as she went farther and farther away. Olga had already given up the hunt and was returning to her starting point, when, in a clump of bushes near the trunk of a young linden, she heard the persistent and despairing cry of a bird and of her troubled brood. Evidently the bird was afraid of something. Olga peered into the thicket, which was surrounded by high, thick, white-flowered grass, and discovered there something blue resembling a forest knoll. She approached and examined it closer. It was Miehka. It was of Miehka that the bird was afraid and against Miehka that it was crying out. Miehka was lying upon his fat belly, with his hands under his head and his big, bandy legs stretched out; he was asleep. Olga woke him, gave him some strawberries, and called his mother.

And for a long time thereafter Olga recounted to her parents and relatives and to all the people she met how she had searched for and found the child of Akoulina.

The sun beat down straight upon the forest and heated with its rays the earth and everything upon it.

"Olga! let's go and take a bath," said some little girls who came running up.

All together they went singing to the river. They were so busy pushing and pulling one another, so busy shouting and beating the water with their legs that they did not see the black clouds which mounted the heavens from the west; they did not remark that the sun hid itself from instant to instant, that the perfume of the flowers and of the birch leaves became more penetrating; they did not hear the light claps of thunder. But before they had the time to dress the rain fell. The little girls, with their chemises clinging to their dripping bodies, ran to their house, ate, and carried into the fields the dinner of the plowmen.

When they returned from the fields their chemises were already dry. They sorted carefully the berries, put them into bowls and plates and carried them to the house of Nicolas Sémionovitch, where they knew that they would be well paid.

But this time the berries were not wanted there.

As soon as Mary, who, stifling with heat, was reclining in an easy chair in the shade, caught sight of the little girls with their berries, she signaled to them with a movement of her fan to go away.

"No, no; we don't want any!"

But Vala, the oldest son, a boy of twelve years, who was resting from the overwork of the lycie and who at that moment was playing croquet with some neighbors, ran to Olga, when he caught sight of the berries, and asked her how much they were.

"Thirty kopeks."

"They are dear," said he. He said that because he was always hearing it said by his elders.

"Hold on! Go round this corner and wait for me there." And he started to go to his old nurse. During his absence, Olga and Groushka admired a glass

globe on which they saw a little house, some woods and some gardens; and this globe and the many other things they saw did not astonish them, for they expected to find the most marvelous things in this world of nobles—mysterious and incomprehensible to them.

Vala went to his old nurse on the run and demanded of her thirty kopeks. The nurse thought twenty kopeks enough, and she took them from a box and gave them to him. Trying to escape the notice of his father, who, feeling the need of refreshment after his painful night, had only just risen and was smoking and reading his papers, he brought the twenty kopeks to the little girls and devoured the plate of berries.

On her return to the house, Olga untied with her teeth the corner of her handkerchief into which the twenty kopeks were knotted and gave them to her mother. The mother put the money away in a safe place, and gathered up the soiled clothes to go to the river.

Taraska, who, since lunch, had been helping his father work the soil, was sleeping at this moment in the thick shade of an oak. His father, seated beside him, was watching the horse, which was browsing near the edge of a neighbor's land, and which, in spite of the fact that his forefeet were tied, was in danger at any moment of doing damage to the neighbor's bat field or meadow.

The family of Nicolas Sémionovitch had resumed its ordinary aspect; everything was going well; the three-course lunch was ready and the flies had long been regaling themselves upon it, but nobody went to the table, because nobody was hungry. Nicolas Sémionovitch was proud of his opinions, whose value was evident to him, because he had refound them that very morning in his newspaper. Mary was tranquil because Goga's stomach was no longer out of order. The doctor was content because the remedy which he had prescribed had produced the desired effect. And Vala was blissful because he had eaten a heaping plate of strawberries.

YASNAYA POLIANA, RUSSIA.

To a Friend in Rome

BY MABEL BACON ENGLISH

ROME holds the glory of the days of old,
And tulips spring where once a Cæsar trod:
Here in my garden, after frost and cold,
Brave jonquils thrust their fingers thru the sod.

Is there a joy in all the wealth of Rome
That equals quite the thrill my heart receives
When, some still morning under God's still dome
I see the first faint promise of the leaves?

Or, when the evening comes and veils the hill,
And low stars tremble in the throbbing blue,
I hear from lone, low meadows, clear and shrill,
The frogs' first piping to the springtime new?

Can pomp of oleander or of rose
Quite give the utter bliss the mayflowers bring
To hearts so weary of the winter snows—
And blood-root, daintiest offering of the Spring?

Deep, vivid, passionate the joys of Spring
There in the heart of glorious Empress, Rome:
Here in my garden wrens and thrushes sing:
A shy, sweet spirit is our spring at home.

HARTFORD, CONN.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Senator Rayner

ISIDOR RAYNER, of Maryland, is worth watching. He was not to be lost sight of under the unwritten prescription of silence for new Senators. He is not that kind. He has already made his mark — made it deep and broad. Few brainier men can be found. His will be a strong hand on the helm of the Ship of State for years to come. He is one of the few—painfully few, when we remember that there are in all ninety nominal members in that august chamber—one of the few upon whom the people will lean more and more, to guide legislation for their benefit.

SENATOR ISIDOR RAYNER.

With Spooner gone and Bailey slipped from his high pedestal, there will be readjustments next session, and Rayner is destined to grow. He has already made both fame and fortune at the bar. He has been an able attorney-general in Maryland. He has been thru the legislative mill in three terms as member of the House of Representatives. He is not the man to keep silent when opinions are in order. He has them—good ones—on any subject that can be broached. He is earnest and honest with his convictions, and, better, he has, superlatively, the courage of them.

He leaped at once into the arena and was in the thick of the fight—the great fight—over the Railroad Rate bill, from the moment he had made his calling and election sure. His scintillating rhetoric was hurtling thru the Senate while he was yet so fresh from court conflicts—so new to Senatal debates—that over and again, absorbed by the energy which possessed him, he addressed the chair, not as "Mr. President," but as "May it please the Court!"

Solemn faces about him wrinkled in smiles, but they thought none the less of Rayner or of what he was saying. Every one likes Rayner. He is the likable kind. He says sharp, caustic, vitriolic things, but he says them so gracefully. He is fifty-six by the calendar. That does not matter, however, for he is not the kind that grows old. A touch of silver at the temples is worked into his dark-brown hair, by way of decoration, not indication. The hair has left the crown and is retreating from the big, bulging forehead, but that only helps to emphasize the deep, broad head. A remarkable head it is, by the way; tremendously suggestive of intellectual qualities and first class mental machinery. It rests on a short, sturdy neck, over solid shoulders and a full chest—good deliverers of the products of the mill above. But it's mostly the face that frightens one till he has found his way. That overhanging forehead, with quick, dark eyes set back in the shadows, the dominant nose, the bristling mustache and determined chin are

suggestive of disagreeable things which do not materialize. Rayner is democratic and cordial. He is quick to see the best in others, and there are few who make better, more genial friends.

Mentally and physically Rayner is one of the substantial, solid sort, with good digestion waiting on good appetite. I had the honor of lunching with him the other day in the Senate restaurant. His choice was a large platter of corned beef and cabbage and a cup of coffee. It is nothing tangible which renders one timid about approaching him. It is nothing real. His dignity is imperturbable, but never offensive. He is readier than he looks to meet one half-way.

Rayner has been the only Jew in the Senate. There are several in the House. There have been four or five back in Senate history. Benjamin left the Senate to be Confederate Secretary of the Treasury. There will be another in the chamber next session, when Guggenheim of Colorado takes the oath. Rayner indicates his ancestry best in the flowers of rhetoric which bloom in every field of debate he enters. Every sentence which he speaks lies in lines of beauty, and his periods are rounded in eloquent climaxes. He has, *facile princeps,* the art of gracefully manipulating words without letting the embroidery and poetic drapery deprive a single sentence of its rugged strength.

When Rayner was a member of the House, President Cleveland summoned him to the White House and offered him the position of Minister to Spain. There is good diplomatic material in the man, but he replied:

"While I should be glad to serve you and the country in the capacity you propose, I find upon reflection that it is impossible for me to do so. But, Mr. President, if you think you owe me or my State anything, I would like to make a swap with you. Instead of appointing me Minister to Spain, be pleased to appoint the son of a constituent of mine a cadet at the Naval Academy."

There was no vacancy in Rayner's district, but the appointment was forthwith made.

Rayner is a careful thinker, a brilliant speaker and merciless against measures he considers wrong; but his inclinations lead him to be too good a friend to permit of his being a very bitter enemy.

Senator LaFollette

Robert Marion LaFollette was well among the watched before he emerged from the Governorship of Wisconsin to enter the Senate, two years ago. He came from hot times in the Middle West. He came after three consecutive elections as Governor. He came charged to the muzzle with the mission which had brought him to the front in Wisconsin. He told me that he was ready to sacrifice everything for the success of that mission, and his history in the Senate indorses it. He came filled to the brim with facts, and under full head of steam determined to accomplish grand reformations, and in the two years he has not abated the pressure. He is as devoutly earnest and intense about it all today as ever, and if his courage holds out he will accomplish great things, tho not so great, perhaps—surely not so quickly—as he anticipated. For the Senate is a slow, deliberate machine. It does not often round curves at dangerous speed, even when a man with all LaFollette's energy is pushing.

No one for an instant doubts LaFollette's integrity of purpose and determination—no one but admires his courage—but some of the strong ones, some of the mighty ones whose hands are on the lever, have questioned his judgment and rather overrash assaults upon the Senate as a whole and Senators individually, in his efforts to push things faster than things wanted to be pushed. They will be very helpful to LaFollette later when the first agony is over—when he has tamed his energy to Senatal solemnity.

LaFollette has undeniable ability, and he is right on the main issues. Many a great man who has turned reformer has been led beyond enthusiastic support and been eaten up by the zeal of his cause; but LaFollette stopped short of that. He is growing stronger. He has more friends in the Senate than he thinks. He will find it out when he stops jabbing them. He is far from being so lonesome as the press imagines in his ruling passion to correct monopolistic evils. There are precious few who command the undivided attention of the Senate when they speak. LaFollette tried to command it before he had been long enough in the Senate even to know the

rules of debate. The oldest as well as the youngest Senator must earn his audience, and often, then, be satisfied to go without it. It is not an indication of invariable accuracy. LaFollette is recovering from his early wounds and growing stronger.

In the committee rooms, the Marble Room, at his home, LaFollette is one of the pleasantest men in the world to meet. He is the smilingest reformer who ever fought iniquity. He is made for smiles, even when he has to play Patience on the monument. His face is round and

SENATOR LA FOLLETTE.

full and large, smooth shaven, and from chin to forehead is made for smiles.

LaFollette is short, brown, solid. He has a deep lung capacity, out of which rolls a voice like distant thunder. He has a tremendous shock of hair, bristling back from his forehead like a lion's mane, and while the thunder rolls he shakes his head till the hair floats to and fro and trembles as if swept by a full-fledged gale.

His is a unique and attractive personality and with immaterial limitations every one wishes him success in his reforms. He has a message—a real message—bent upon public good, and the man with the message is the man most worthy of attention. Moreover, he is one of the best speakers in public life today, and that is three-quarters of the battle.

William Pinkney Whyte

One of the most picturesque and in a way remarkable figures in the Senate Chamber, thru the last Congress, was William Pinkney Whyte, of Maryland, filling the late Senator Gorman's unexpired term, by the Governor's appointment.

The facts and fancies concerning Whyte clash to incredulity. Even up in the Press Gallery, where they know things pretty well, you rarely heard Whyte's name mentioned among the very old men on the floor. It was simply impossible to meet him every day and keep that fact in mind. You saw him on his feet, on the floor of the Senate, and you never thought of him as old. He stands straight as an officer on parade. His broad, square shoulders have the quick, elastic swing of youth to them. His chest expands, his head goes back with a defiant toss, and in a clear, corner-finding voice he sends out every little syllable clean-cut and carefully emphasized. If you met him in the Marble Room or corridors you found him going at an energetic pace too fast for many of his colleagues. If he stopped to speak with you, you may have realized the strong, old-fashioned, Websterian face, but you were caught by the keen eye, quick wit and hearty laugh. There's nothing time stained about them.

Early in the session a man with white hair and mustache, not over fifty, but somewhat resembling Whyte, entered one door of the Marble Room as Whyte entered the other. A stranger who had sent his card to Whyte accosted the wrong man. The mistake was corrected, and the wrong man said to Whyte:

"Senator, I have just been greatly honored. I have been taken for you."

Quick as a thought Whyte laid his hand on the other's shoulder, remarking:

"Young man, the pleasure's all mine."

Incidentally, Senator Whyte is eighty-three years old. He and veteran Senator Morgan—who can hardly walk, much less run, down the corridors—were born within two months of each other. The Patriarch Pettus is his only senior in the Senate. A remarkable history Whyte's has been. Twice he has been appointed to the Senate by Governors to fill unexpired terms—the first time taking Reverdy Johnson's place, the second time Senator Gorman's. Between the two he was elected to the Senate by the Legislature, resigning the Governorship of Maryland to accept. There's an odd bit of the sarcasm of destiny in this last return to fill out the unexpired term of Arthur P. Gorman, when it was the peculiar political play of that same Gorman which ousted Whyte, in 1881, to secure the seat for himself.

Whyte is the only living man who voted against the adoption of the Fifteenth Amendment. His convictions have not changed; as witness the spirited speech he made in the Senate this last session against centralization of power as implied in the address of Secretary Root. It brought the past up close to listen to his speeches and realize that it was the same Whyte who once occupied desk fifteen and bristled in debate with Sumner, Oliver P. Morton, John Sherman, Cameron, Zach Chandler, Conkling, Edmunds of Vermont, Lot Morrell of Maine, and Sprague of Rhode Island, with Ben Wade in the chair. It is to Whyte, too, that Washington owes her start along the road to the City Beautiful, and it was Whyte's bill which relieved the citizens of the burden of taxes for the entire expenses of the District.

WILLIAM PINKNEY WHYTE,
The Grand Old Man of Maryland.

The fine old Maryland statesman was a picturesque attraction of the Fifty-ninth Congress. It is not often that a Senator makes three maiden speeches there; not often that he says three farewells. There was something peculiarly sad about his going this time, when the session closed; something more than unique — something always genial, cordial, optimistic, democratic, something like real old-fashioned dignity and integrity, something like sunshine seemed slipping away with no possibility of return or of ever being duplicated.

The Confessions of a Stock Speculator

BY A WALL STREET "PIKER"

[Owing to the exceptional conditions prevailing in the stock market for some weeks past, this story of a speculator's experience is a timely one, and should be instructive. Evidently it is the story of one who has been unsuccessful, and allowance must be made for the cynical attitude which is due to failure. We would not be understood as supporting all of the writer's assertions, some of which are colored by his disappointment. As for the terms which are used, it may be said that the slang of "the Street" is at all times forceful and picturesque as well as accurately descriptive. No other language can be substituted for it in describing matters and things pertaining to this locality. Hence the individual indicated by the term "Piker" cannot be otherwise described short of a sentence, or, more likely, a paragraph. Obviously the writer of this article prefers to remain anonymous, but that he speaks from intimate personal knowledge and experience is apparent and is vouched for.—EDITOR.]

MY experience in Wall Street began in the spring of 1898, on the edge of the great bull market that continued almost unbrokenly for the next three years. I began with practically no capital, built up a good-sized fortune in the three years ending May 1st, 1901, lost every dollar of it on the memorable 9th of May of that year, and thereafter struggled along with varying fortunes until the slump following the San Francisco earthquake finally wound me up as far as Wall Street is concerned. At the outset I was the veriest tyro, knowing absolutely nothing of speculative methods or modes of procedure. In those halycon days it was not necessary; all one had to do was to buy stocks and take profits. I was always guilty of all the sins described in the "Confessions of a Stock Broker." I always overtraded, generally overstayed the market, always took profits too soon, always clung to a loss to the bitter end. I was always up to my neck in every panic and slump and spent many sleepless nights and anxious days in consequence thereof. But with it all I gained experience and knowledge, which I here set down; and if it serves to restrain any who contemplate certain ruin by dipping into Wall Street, I shall feel that it has not all been in vain.

Any one engaging in speculative trading on the New York Stock Exchange must do so thru a broker. He alone has the *entrée* and the privileges of the Exchange. Brokers generally occupy handsome offices, expensively fitted up, in which is a room for the use of their customers equipped with a stock "ticker," a blackboard and various and sundry files of informatory papers, statistics, telegrams, etc., bearing on the business in hand and collectively known as "dope." Generally speaking, brokers are honest in so far as their business permits them to be. Their business is to encourage trading in order to secure commissions, and all brokers are not strictly scrupulous as to the means and methods used to encourage their customers to trade. While it is true that brokers like to have their customers make money, as a winner is a readier trader, yet it must be borne in mind that the broker's interest and responsibility do not extend one iota beyond securing his commission and keeping the margins good. If the customer loses, the loss is all his. The broker may, and probably does, politely express his sym-

pathies, but his commission is secure, and he is not worrying. As a rule, brokers have no better information or sources of information than their customers. Even when brokers are acting for some large interest that really controls the market, they dare not drop the slightest hint to their lesser customers of what is going on, as such a proceeding would be pretty sure to be discovered and they would lose a most desirable customer. The trader should at the outset rid himself of the idea that his broker is in any way an authority on the market, for such is practically never the case. If a broker urges the purchase or sale of any particular stock it is a pretty safe bet that his sole consideration is the commission.

What, then, should be our guide in speculation? What are our sources of information? For without some hint or inkling of the future of stocks how can one trade intelligently? Let us consider the sources of information at the disposal of the trader. First, there is the "market tip"; second, the "inside tip"; third, newspaper stories and gossip; fourth, news bureaus and market opinions by professional opinion makers and professional tipsters; fifth, statistics as to earnings, financial condition, business condition, etc., of the various properties whose stocks are dealt in; sixth, money and financial conditions of this and other countries.

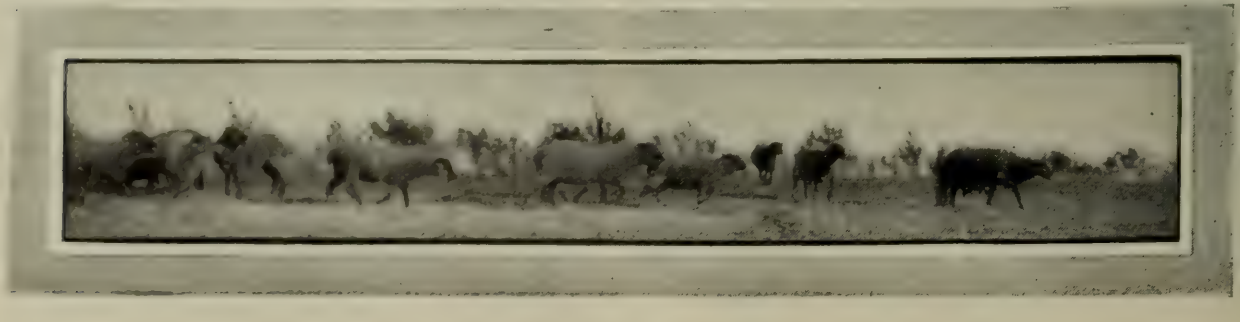
The market tip is dispensed either by word of mouth or by wire. On a table in every broker's office is a slip containing telegraphic messages from other brokers' offices or correspondents giving current gossip on the market. These come in with tolerable frequency and are given credence in proportion to the nearness—real or supposed—of the sender with the fountain head of the subject under discussion. Often they contain merely information as to what brokers are buying or selling certain stocks, said brokers supposedly acting for important principals and thus furnishing an indication as to the market attitude of those principals. Again, they contain positive opinions and prophecies by some prominent individual or firm as to the probable course of a certain stock. A few men, whose names are well known, are fond of issuing such pronunciamentos; and, as they are leading market manipulators, they easily attract an audience. Only the veriest "lambs," however, place any credence in such information. The purpose of these statements is too palpable, and the wise ones, if they pay any attention to them at all, "copper" them; that is, do just the opposite to the thing advised. The most insidious market tip, however, is that delivered by word of mouth. Some individual with whom you have scraped an acquaintance in your brokers' office, and with whom you have often swapped opinions and condolences, will come in some morning and with preternatural solemnity back you into a corner out of ear-shot of the bystanders and tell you that last evening he spent an hour with So-and so, who is a close friend of Harriman, or Morgan, or Rogers, or some other celebrity, and was told beyond question of doubt that such-and-such a stock would have a ten-point move right away and to buy it fearlessly and without limit. He backs his statement up by putting in a liberal order. A few years ago "Gould's private secretary" was the hero of this type of market tip. It was both astonishing and amusing how many confidential friends "Gould's private secretary" had and what intimate knowledge he had of Mr. Gould's market intentions. It is no uncommon thing for your broker to be the man who backs you into a corner and tells you these sacred things; and you generally believe your broker and act on his suggestions, to your almost invariable sorrow. You may also spend your evenings in the corridors of the Waldorf, where brokers and stock traders most do congregate, and there pick up a varied line of information carefully set afloat by clever stock-jobbers. The market giants who give utterance to valuable opinions in this place often obsess you into acting on information thus gained. Market tips are infinite in variety, but they all serve one purpose—influencing the unwary to further the market operations of the man who sets them afloat. There is just one thing to do with a market tip: let it severely alone.

An "inside tip" is one that really comes from some individual whom you personally know to have first-hand knowledge, or, rather, whom you believe should and

can have such knowledge. I will give two instances of how an inside tip worked with me. I once met on the street a prominent bank president whom I knew very well. In passing he stopped to shake hands, and incidentally mentioned that he believed the purchase of a certain stock would yield prompt and satisfactory results. This information was given from pure good will, and because he believed he knew what he was talking about. It did not take me over five minutes to get to my brokers and buy 500 shares. I held that stock six weeks before I could get out even! On another occasion a certain "trust" was busy tightening its grasp on the monopoly it was consummating by purchasing all the important establishments in its line of business. Some friends of mine had secured an option on one of the largest and had arranged to turn it over to the "trust" at a handsome profit. This factory was of such importance that its acquisition by the "trust" would considerably enhance the value of the stock. As a friend of an "insider" I was "put next" and purchased some of the "trust" stock, which was at that time very actively traded in. By some oversight a very prominent market manipulator, who was also a director in the "trust," had not been advised of the purchase of this important factory. When he learned of it and the apparent attempt to "turn him down," he gave evidence of his power and spite by smashing the "trust" stock in three days some thirty-eight points! I had accumulated quite a line on the decline, knowing that I had a "cinch," but by the time Mr. What's-his-name got thru smashing that stock I was hanging on by my eyelids; another two or three points and I would have been wiped off the map. However, about this time his wrath was appeased, and he had doubtless accumulated enough stock to suit him, and it began slowly climbing up again. When it got up to the point where my average let me out even I was most happy to get out—and the stock never stopped until it went up a hundred or more points and passed forever off the blackboard into the strong boxes of the "insiders." My friend, the "insider" who gave me the tip, went out a good deal nearer the bottom than I did, and lost on his stock speculation all that he made by selling the factory "to the trust." It is among the possibilities that the smash was engineered for just that purpose; there is ample precedent for it. These two incidents are fairly representative of "inside" tips. I personally never made a dollar out of an "inside" tip, and have lost a great many through them. It is a popular fallacy that the high officials of railways must be exceptionally well informed on the probable future of their stocks. Nothing is further from the truth. For the most part the financial, and especially the stock market, end of the railroad business is handled by directors residing in New York, and the high officials get their information of various actions when the public do—that is, after they have happened. It has become almost an axiom in Wall Street that an "inside tip" will break you quicker and harder than any other agency. Moral: let them alone.

Newspapers that are honest and unbiased will invariably remain entirely neutral on the market. They will state facts and conditions without comment that would lead the reader in either direction. But the majority of financial writers for newspapers are personally interested in the market, and their comments are colored by their own market position. Again, a number of newspapers—either the entire paper or the financial columns thereof—are controlled by the market giants, and their market comments are designed to further the plans of these men. Therefore, when one reads the financial columns of the newspapers he cannot fathom the motives behind them; accordingly, as market guides they are unreliable and even dangerous.

There exist in Wall Street a number of so-called "news bureaus," whose business it is to collect and disseminate the happenings thruout the world from hour to hour that may have an effect on the market. They also dispense "tips" based upon the gossip they collect. As news gatherers they serve a useful purpose, but as market guides they have no value whatever. There is also a class of individuals who prepare daily "market letters," which are telegraphed every morning to their subscribers. These individuals arrogate to themselves exceptional facilities for



judging and forecasting the future of the market, and always speak with great authority. As a matter of fact, they are no better situated to judge the market then the veriest "piker." They make their guesses just as every trader does, and they are guesses and nothing else. Any one consistently following them will do so to his certain ruin.

An intelligent study of financial conditions and the condition and earning capacity of the various properties traded in on the Exchange is indispensable to intelligent trading—if there is such a thing. But while in the long run these fundamental facts count, market manipulation is the thing the trader has to cope with daily, and market manipulation as often runs counter to real conditions as the reverse. For example, there may be a stock in which fundamental conditions are so flattering that the "piker" cannot see how it can do otherwise than soar. If he buys accordingly, he views with consternation its daily slump. After it has gone down ten, twenty or thirty points and he has been called for margins or has sold outright on the bottom, he learns that the members of a pool in that stock were seeking to dislodge a big block of stock which they wished to acquire, and had smashed the stock for that purpose. Fundamental conditions cut no figure in such cases, and these are the incidents of daily occurrence on the Exchange.

Experience teaches, then, that there is no such thing as reliable information as to the future of stock movements. It is all guesswork, and the guesses are usually wrong, for every conceivable agency is employed to make them wrong. When the "piker" finally wakes up to the real situation he finds it to be about as follows:

The stock market is absolutely controlled by a half dozen "giants." One might almost say they own it. It is not necessary to name them. These men control nearly all the railways, industrial corporations and traction companies in the United States. They control a great many of the largest banks, and, until recently, they controlled half a dozen of the largest life insurance companies. Their command of money is unlimited. Their market maneuvers are always "sure things." They know what is going to happen beforehand. There is no "future" in the stock market to these men: they themselves make the future. Witness the recent increase in the Union Pacific dividend. The public were made to believe the dividend would not be increased. The regular day of announcement passed without an increase being announced. The stock had been advanced on the expectation of an increase of probably 1 per cent. When no increase was announced, traders sold, most of them selling "short." A day late, an increase of *four* per cent. was announced, and a bear panic prevailed. The insiders made millions. They had known for weeks what was to happen. This is a fair example of what Wall Street is and what the "piker" is up against when he enters it. He is putting his insignificant capital and blank ignorance against billions of money and certain knowledge. He is guessing where they are certain sure.

It may be smart and shrewd for a set of men who entirely control the situation to make their millions out of a deluded and hoodwinked public. But the public that keeps letting them do it are fools, individually and collectively. Stock exchanges are based upon the theory—which continually proves to be fact—that there is a "sucker" born every minute; and that is what the "piker" invariably is—a "sucker."

Literature

A Group of Historical Novels

THE last of Fogazzaro's trilogy, "The Saint," was the first to be read in this country. But *The Patriot*[1] was really the first of this series and appeared ten years ago in Milan. It is a story of the little ancient world of Vasolda in 1848-49 during the period of Austrian oppression. It is not, as the title intimates, a book of battles, but rather it is an interesting and minute picture of Italian life and an interpretation of the Italian consciousness, which is quite different from foreign descriptions of the same, and it is of importance chiefly because it contains an intimation of those great qualities which afterward distinguished Fogazzaro as a literary artist and philosopher. *Ridolfo*[2] is another story of Italian life during the fifteenth century. It is founded upon the usual tortures and martyrdoms of the times. And the closing scene, where Fra Bernardo writhes upon the rack, while the blessed maiden stands by shrieking to the ruling despot to spare his victim is exactly like some scenes often enacted at the old Thalia Theater on the Bowery. The question is. Are the people on the Bowery still far enough back in time to be entertained by the poignancy of such situations? And the same question may be asked about those who read historical romances for that matter. There is at least less horror in Valentina Hawtrey's *A Romance of Old Wars*.[3] And in spite of the sorrows and poverty and the pathetic ending, the author has caught that glamour which is the sunset radiance of the past ever shining behind us. Baroness Orczy's last story[4] begins at the opening of the French Revolution. And, as usual, she insures the reader's interest by choosing a strong situation. A young and brilliant woman undertakes to avenge her brother's death, but falls in love with her intended victim. After that they betray and save each other by turn, and always in a most thrilling manner. Margaret L. Woods places the scenes of her story[5] in a period subsequent to the Revolution—a period charged with the presence and influence of the great Napoleon. After deposing Ferdinand VII the Emperor placed his brother, Joseph, on the Spanish throne and imprisoned Ferdinand in the Castle of Valençay, the country home of Talleyrand, which was in the heart of France. The story hinges upon the effort of the gallant young Irishman, Dillon, to rescue the imprisoned monarch—an effort baffled by the proverbial Bourbon stubbornness and stupidity. The narrative is clogged with details and embarrassed by the introduction of too many characters, but it is a careful study of the types and is written with unusual fulness of information.

ANTONIO FOGAZZARO,
Author of "The Patriot," Putnams.

No matter how modern we get to be, there come times when we still belong

[1] THE PATRIOT. *By Antonio Fogazzaro.* New York: G. P. Putnam's Sons. $1.50.

[3] A ROMANCE OF OLD WARS. *By Valentina Hawtrey.* New York: Henry Holt & Co. $1.50.
[4] I WILL REPAY. A ROMANCE. *By Baroness Orczy.* Philadelphia: J. B. Lippincott Co. $1.50.
[5] THE KING'S REVERSE. By Margaret L. Woods. New York: E. P. Dutton & Co. $1.50.

to the past and when we haunt the dim shadows of it like lovers denied. If this were not so the historical novelist would cease to exist. But once let him clasp hands with that young helmeted lover who is hidden somewhere in every one of us and his fortune is made. This is what Mr. Snaith[6] does in a short narrative based upon certain adventures, purporting to have taken place at a lonely Inn with Prince Charles Stuart for the hero during the period of six weeks after the battle of Worcester when he was a fugitive with a price on his head. The incidents related are like illuminated panels out of the life of the Seventeenth Century in England, and at the same time they show the whimsical charm of the vagabond prince. The best work in the book, however, comes from the author's dramatic use of the fact that tragedy does not lie so much in circumstance as in the mind of the man involved. To describe a murder is to give merely the outward appearance of tragedy, but the real horror of the thing lies in the mind of the man who conceives it. In all of Snaith's novels the climax depends upon this idea for its extraordinary force. Stanley T. Weyman has come to that place as a novelist where he can afford to amuse himself when he writes whether he entertains the reader or not. Therefore he takes his time and puts in everything he can think of, just for the pleasure of "having his say." This is why his last story[7] moves so slowly. It carries the whole of England with it, down to the last borough election.

Among American historical novels of the season, Harris Dickson's[8] ranks with the best. It is a story of French Colonial days in Louisiana. Mrs. Fraser has not succeeded so well with her novel of the life and times of Mary Washington[9] as she did with her Japanese stories, but the book is of importance because it deals with the childhood of George Washington, which has been too much restricted to the cherry-tree episode. Mr. Ruel Perley Smith's publishers think that his novel, *Prisoners of Fortune*,[10] compares favorably with Stevenson's "Treasure Island." It does not. However, if one is very, very young and not particular about the quality of his pirates, the blunderbuss type portrayed in this book may satisfy him.

Mr. Hubbard's novel[11] gives the impression that the author himself lived in 1776, saw his own great grandfather, who is the "Express" referred to in the title, arrive in the town of York with dispatches from Boston for General Washington—that he did with his own eyes recognize Burr, Hamilton, Franklin, Morgan, Putnam and Washington in the bustling multitude of pioneer citizens and soldiers. And, perhaps, it is the first time in a novel these characters have ever appeared as ordinary mortals and not in the exaggerated rôle of some great achievement.

Brunetiere's "Balzac"

BRUNETIERE'S *Balzac** is a brilliant chapter in the history of the novel as a literary form. A biographer in the ordinary sense, Brunetière was not. He scorned literary gossip and anecdote, the "tittle-tattle of love affairs and the tedious narrative of quarrels with newspapers and publishers." The reader who is solely interested in what is ordinarily called the personal side of Balzac would do well to keep to the letters of Madame Hanska ("Lettres à l'Etrangère") to the publications of M. de Lovenjoul, or MM. Hanotaux and Vicaire. As pure literary criticism, moveover, there is nothing in the present volume to compare with the several essays on Balzac that have come from the hand of Mr. Henry James. But whoever cares for literary morphology, whoever delights in following the organic evolution of literary forms, will find in Brunetière's *Balzac* a work of genuine fascination.

At the outset, however, the reader should be warned that the fascination of Brunetière's study does not lie in its impersonal or scientific character. By a

[6] PATRICIA AT THE INN. *By J. C. Snaith.* New York: B. W. Dodge & Co. $1.50.

[11] AN EXPRESS OF '76. *By Lindley Murray Hubbard.* Boston: Little Brown & Co. $1.50.
* BALZAC. *By Ferdinand Brunetière.* Philadelphia: J. B. Lippincott. $1.25.

curious paradox such as we are always likely to become involved in when we strive hardest to avoid it, Brunetière, the apostle of the scientific method in criticism, was the most personal and partisan of critics. The reason for this is not hard to find. The generalization is the invariable instrument of the scientific method. Where it deals with the facts of observation, the generalization may have absolute and indisputable validity. But where it deals with matters of opinion, and especially with matters of taste, it has validity only for those who are willing to accept it. Now, Brunetière begins with the general assertion, which he holds for truth, that just as Molière "was not only the greatest of comic authors, but *comedy* itself, so Balzac was not only the greatest, the most fertile and diverse of novelists, but the *novel* itself." Immediately he puts himself on the defensive against every one who disagrees with his judgment, so that all that follows in his volume becomes an example of impassioned special pleading.

Having laid it down as the thesis that Balzac fixed the model of the novel as a literary form, Brunetière proceeds to show that the novel before Balzac was in process of evolution, that in Balzac the evolution reached its hight, and that the novel after Balzac, in so far as it deviated from the model of the "master" was in process of deterioration.

What, then, is the essential character of the true novel, of the novel of Balzac? "Balzac's novels," Brunetière answers, "are 'naturalistic,' that is to say, conformably, intentionally, and *de facto* to the reality of life. . . . His novels are not confessions of his life. . . . Their most apparent characteristic is precisely their objectivity." He goes on to show that the essence of the Balzacian novel, as of the positivist philosophy of Comte, is its literal, almost photographic, faithfulness to the real world of our observation. Here, in the novel which gives us an immediate representation of life, he would have us accept the norm, the standard by which to judge all novels.

And by what steps of evolution did the novel attain this hight? And what has been the reason for its decline? To begin with, we find the personal novel, such as "Gil Blas" and "Robinson Crusoe," "which consists essentially in the relation of adventures of which the narrator is the hero, and the object of which is not so much to bring to light his personal qualities and virtues, as to recount the purpose of a human life and the more or less singular fortunes of an individual. Such a novel is history that *might* have been." The second step appears in such books as Rousseau's "Confessions," Goethe's "Werther," Charlottte Brontë's "Jane Eyre," and in the works of the romanticists in general. Under the influence of romanticism, the personal novel becomes the "apotheosis of the ego." It deals, indeed, with exceptional cases, but with cases that, however abnormal, are nevertheless real. It is in this closer approximation to reality that the romantic novel surpasses its immediate predecessor, the novel of simple personal adventure. But the fault with the romanticists was that they believed in themselves to the exclusion of all things else, so that with them "ignorance became the active principle of their originality." The range of their interest was ridiculously limited. But with Balzac the novel extends the range of its curiosity to "everything which might interest a man in his time." With Balzac the representation of life, in the entirety of its range, becomes the "purpose and sole object of the novel." Here is the culmination of the novel's development, and any departure from this faithfulness to reality must be symptomatic of decline. In Flaubert the apostasy begins. In "Madame Bovary," for example, Brunetière declares that Flaubert would wish us to see, not a representation of life, but a work of art; that he is concerned not so much with life as with the use of life in the realization of an artistic theory. "When we tire of reading Balzac," Brunetière concludes, "of re-reading and admiring him, it will no doubt be because the novel itself has become moribund; literary forms are not eternal."

It is engaging argument, arbitrary no doubt, and of limited validity, but illuminating, suggestive, exhilarating. Brunetière entertained a hearty dislike of the romanticists, of men who were interested in life, not for its own sake,

but because it helped them to illustrate their theories of art. Yet in this study he permits criticism itself to become romantic; he is not concerned with the facts of literature so much as with the illustration by means of literature of a favorite critical theory. It is for this reason, perhaps, that the book appeals to one with all the delightful freshness of a work of creative art.

Iles's "Inventors at Work"

THE purpose of Iles's *Inventors at Work** is not evident. That the author had a purpose is to be presumed, but if he has carried it out it was a purpose so subtle as to escape the notice of the reader. It is a contribution to popular rather than technical literature, but in the main fails to fulfil the promise of its title in that it does not show us the inventor at work, but aims rather to catalog the results of invention in certain departments of the world's work.

The only key to the author's plan is found in his chapter headings. Under such general classifications as form, size, properties and measurement, as attributes of matter, he meanders thru chemistry, physics, civil engineering, electricity, naval architecture, mathematics, astronomy, gas and perhaps fifty other subjects, with incidental mention of hundreds more. The illustrations are numerous, but they seem unrelated and to a great extent haphazard. The net result is a book of no little interest, but unsatisfactory to the student and wholly disappointing to the reader desirous of really knowing anything about any subject. That it is full of facts presented in an interesting way is undoubtedly true, but the objection to it, and to all books of the same class, is that it treats facts as bits of colored glass are treated in a kaleidoscope, making attractive, but confusing, transient and usually futile combinations with each turn of the barrel.

As a stimulus to invention and discovery this book may or may not accomplish its apparent purpose, according to the temperament of the reader. If practical it would help him but little; if purely imaginative and prone to make inventions which are not needed and cannot be profitably developed it might prove an inspiration. In either case the end in view would be better served by much simpler means. How does the mind of the inventor work? This question was once answered to the satisfaction of the writer of this review from watching Thomas A. Edison in a railroad car. He was a passenger on a special train, one of a party going to celebrate the birthday of a great engineer. Being deaf, Mr. Edison took no part in the conversation, but sat alone. An empty cigar box was left on the seat beside him and forgotten. The landscape being uninteresting, Mr. Edison looked about him, noticed the cigar box, reached for it and began to examine it, not in the superficial way in which the average man would have looked at it, but with what John Burroughs calls "that steady aim of the eye," which both sees and perceives. He first looked it all over outside, examining its corners and noting how it was framed. Then he raised and lowered the lid to see how it was hinged, tested the thickness of its walls and its stiffness and strength under compression between his strong hands. By the time the examination was finished he probably knew all about a cigar box of the typical pattern and understood why everything about it was as it was. But he did not stop there. Unconscious of observation, he began a series of experiments to see what a cigar box, or something of that shape, was good for besides holding cigars. Being hollow and resonant, like a fiddle body, he put it to his teeth to see if it aided in transmitting sound vibrations to the organs of hearing. These tests were made in as many positions as its shape permitted. They were repeated with the cover slightly raised, more raised and wide open. Obviously here was an ingenious deaf man studying methods of improving the audiphone. What thought remained when he laid the box down no one but himself knew, but this piece of rubbish had certainly taught him all it was capable of imparting, and whether or not it repaid the attention it had received it was studied with exactly

* INVENTORS AT WORK. With Chapters on Discovery. *By George Iles.* New York: Doubleday, Page & Co. $2.50.

the kind of attention to things of unknown utility which has made Mr. Edison the great inventor he admittedly is. To observe an incident of this kind is like hunting with the camera. In no other way may one know what really are the habits of the animals concerning which he may be curious. The story of inventions as given to the world by inventors are rarely told truthfully. They are colored largely by imagination. But if they could be told exactly and in minute detail they would not be likely to be instructive to others, since no two minds work along exactly parallel lines, and not one man in a thousand, having attained a result, is able truthfully to describe the path he followed in reaching it.

On New Found River. By Thomas Nelson Page. New York: Charles Scribner's Sons. $1.50.

Mr. Page writes no new stories these days. The most he can be induced to do is to add a sort of Christmas codicil to some old one. *On New Found River* was a disappointment to many when it first appeared, and but for the illustrations, which are exquisite, this new holiday edition of the story is no improvement. It is simply an elaboration. However, this, or any of Mr. Page's stories of life in old Virginia, have a sentimental charm which recommends them to all who are interested in the romantic portrayal of the most romantic civilization that has existed in modern times.

The Illustrious O'Hagan. By Justin Huntly McCarthy. New York: Harper Brothers. $1.50.

There is no dependence to be placed in Justin Huntly McCarthy—that is, no spiritual dependence. The mind he has is too versatile, Christian, pagan, or wanton, as his mood and the theme suggest. It is not half a year since he followed the fortunes of the "Maid of France" thru a splendid romance with the high mind of a Sir Galahad. In that book he developed such a literary talent describing angels and innocence that one might easily believe him capable of seeing visions himself beneath the old Fairy Tree at Domremy. But the Illustrious O'Hagan has turned his head once more, and his last novel is an example of what he can do by way of interpreting the dissolute court life in a German principality during the eighteenth century. The O'Hagan is an Irish gentleman and soldier of fortune with a twin brother who fills the tale with a humorous duplicity by his very existence. All the men are rakes, all the women demimondes save one, and the curtain falls when The O'Hagan elopes with her. It is a stirring tale written with the author's accustomed grace and with a certain wanton sprightliness, which, for all its fascination, is a distinct lowering of his literary standards after the grave beauty and fine exaltation with which he wrote "The Flower of France."

Literary By-Paths of Old England. By Henry C. Shelley. With illustrations from photographs by the author. Boston: Little, Brown & Co. $3.00.

To carry in one's travels a complaisant stylograph and an accommodating kodak is always desirable, in the interests both of one's friends and of long evenings in later life. Mr. Shelley has done this well with respect to a dozen of the favorite Meccas of the literary pilgrim in England: Burns, Keats, Goldsmith, Gray, Hood, Spenser, Sidney, Gilbert White, and William Penn. It cannot be said that he has added much to the known facts set down in the later studies of these favorites of the muses and the historian, or that, by selection, picturesque description and charm of style he has contributed largely to the delight of those who love books for these graces; but in choice illustrative matter, well printed and copious, the reader will find much that brings home to him pleasantly the by-paths of the idlers. Among these by-paths one leads, in the Keats country, to the John Hamilton Reynolds family, and develops new and valuable material as to the concomitants of Wordsworth's "Peter Bell." Two or three letters there would alone justify the volume. Of interest and value also are the studies of Gray and Burns, as to the birthplace of the "Elegy" of the former and as to the three early homes of the latter.

Literary Notes

....A very useful handbook for the reading or study of one of the most important, but least understood, books of the Bible is Canon Driver's *The Book of the Prophet Jeremiah:* A Revised Translation with Introductions and Short Explanations. [Scribner. $1.50.] Especially helpful to the ordinary reader is the arrangement in paragraphs, with enlightening sectional headings.

....A collection of pleasant addresses, by Charles William Super, ex-president of Ohio University, called *A Liberal Education,* is supplemented in the appendix with a list of the world's best books. Such lists are a little like the menu of an elaborate banquet, no one would devour them all or find all to his taste, but, as such lists go, it is a good one "of fifteen hundred duodecimo volumes," by four hundred authors, and all accessible in English. (Syracuse: C. W. Bardeen, publisher.)

....The latest number of the "London Library" is *The Interpretation of Scripture and Other Essays,* by Benjamin Jowett. The title essay is reprinted from the celebrated "Essays and Reviews," and the other papers are the "Dissertations," also still valuable, from the "Epistles of St. Paul." The book is equipped with a paper on "Jowett's Life," by Sir Leslie Stephen, reprinted from the *National Review* of 1897. It would be difficult to find a volume containing more valuable material on Biblical subjects in cheaper form than is here offered. [Dutton. $1.]

....The Gettysburg edition of the *Works of Abraham Lincoln,* edited by Nicolay and Hay, is now completed by the publication of the eleventh volume, which is mostly taken up with a bibliography by Judge Fish of over a thousand books and pamphlets on Lincoln in all languages, and the twelfth volume, containing the index to the whole set. This is the edition which should be selected for purchase by any public or private library of importance on account of its completeness and reliability. It contains 2,254 speeches, letters, etc., which is 750 more than any other edition. It is published by the Francis D. Tandy Co., New York.

Farmhouses are usually unsanitary. There is great encouragement in the direction of better country homes in a book brought out by Whitcomb & Barrows, Boston (60 cents), called *The Healthful Farmhouse.* Mrs. Helen Dodd is the author and Mrs. Ellen H. Richards adds an introduction. We have enough advice to people who own or build pretentious country houses; but the real farmer, who must live in his farmhouse all the year round, needs instruction in sanitation and wholesome living, which is just what the book gives. The farmer's wife will find additional help in *Food Materials and Their Adulterations* ($1); a new edition of which is published by the same firm. In this book Mrs. Ellen H. Richards is practical, scientific and sensible, as always. It is not a sensational exposé, but a well digested fund of facts which will help the housewife in selecting food for her family. *Good Luncheons for Rural Schools Without a Kitchen,* by the same author and publishers, is another useful handbook. [Whitcomb & Barrows. 10 cents.]

Pebbles

"I HEARD of a stirring episode yesterday."

"So?"

"Jinks, of all persons, was found cooling off his tea."—*Harvard Lampoon.*

WHEN the jury decides upon the sanity of Harry Thaw it will do well to turn its attention to some of the special writers who are giving impressions of the trial.—*Cleveland Leader.*

"WHAT was all that noise about at your house this morning?"

"Oh, nothing at all. Johnny sat on his grandmother's false teeth and they bit him."—*California Pelican.*

AN American drove in a hansom up to the British Museum, leaped out, kicked aside the pigeons that were feeding in the court, and cried to the uniformed official at the door:

"Have you still got the Elgin marbles?"

"Yes, sir. Of course, sir."

"Good. And the Assyrian winged bulls?"

"They're still here, sir."

"What about those 6,000-year-old human remains on the second floor—they're not sold yet, are they?"

"No, indeed, sir. Won't you step in and see them?"

"No, thanks. I'll just take them as per catalog. You see, I've got Westminster, St. Paul's, the Houses of Parliament, and the South Kensington to do this morning, and I must get a train for Oxford in time to run over the colleges before starting for Stratford for the night. So long, sir."—*Tit-Bits.*

SENIOR REMINISCENCES.

The chapel clock peeled the hour for us and we ate it with epicurean enjoyment. We were walking together, the Senior and I, and I listened with baited breath while he told me a fish story. Arm in arm we walked, but suddenly he stopped, and drew his hand across his eyes. It was a good likeness, but obscured his vision a bit. Then he resumed:

"We sure were a bunch of hummers in our freshman year. In our snow-ball fight with the Sophs on Washington's Birthday, three of us gained the fence, and began to chop it up into small pieces for souvenirs. Suddenly a seven-foot Soph grabbed the smallest of my assistants, but with a well aimed snow-ball between the eyes, I laid him low, while scarlet streams rolled down his face and made intricate arabesques on his collar."

The Senior paused and fetched a sigh—goodness knows where from.

"But whence the scarlet streams?" I interrogated. "Was it blood?"

"No," he palpitated. "There was a tomato inside the snow-ball."

Then silence fell, but we sustained it between us.—*Yale Record.*

Editorials

The Railway Situation

Mr. Morgan said he had suggested to Mr. Roosevelt a conference with four railway presidents "as to what steps might be taken to allay public anxiety concerning the relations between the railroads and the Government." There was no such anxiety of a public character, nor has it been created by the severe depression and sharp fluctuations of the stock market since his brief visit at the White House. It is probably true that a considerable number of innocent stockholders have been frightened by the decline of market values, but anxiety as to the purposes of the Government with respect to railroads is confined in the main to the managers and capitalists who control the railway companies, and especially to those managers and capitalists whose sins have been exposed. The President intends to enforce the law and to punish those who break it. Naturally, this intention is a cause of anxiety in the minds of some persons; with the general public it is a cause of rejoicing.

Railroad officers complain that they find it difficult to borrow money except at very high rates, and that the people are unwilling to buy new securities issued by their companies. There is a warrant for high rates in the strain upon loanable funds at every money center in the civilized world. Railroad companies are not alone in being subjected to demands for high interest. This condition of the loan market here and abroad does not account, of course, for the attitude of the average American investor toward fresh issues of railway stock. For this there are other causes. Will any railroad president say he does not know what they are?

Manipulation of life insurance companies and surpluses, evidence as to the control of railway systems by Standard Oil capitalists and others of their kind, proof of capitalistic influence in support of rebates, proof that companies and investors have been deceived and robbed by officers' and bankers' syndicates—this brief list suggests some of the reasons which have discouraged investment. Harrimanism is a term that covers a considerable number of those acts which the people persist in regarding as offenses against the moral law, if not against the statutes. And now, when the complaints of the officers are louder than ever before, Mr. Harriman himself, fresh from the witness stand where he was pilloried, assumes the position of spokesman for American railway interests! Is there anything in this to inspire confidence in new issues of securities? Does the history of the Chicago & Alton stocks and bonds give force to his plea for "fair play"? Do not both the history and the plea increase the public's disgust?

If the railroad companies that increased their dividends last year had wisely husbanded their additional resources for the expenses of those improvements and extensions the necessity for which should have been foreseen, they would not now be so completely at the mercy of lenders. It is a prevailing belief that the most notable of those increases were made with a view to their effect upon speculation in stocks. This has not commended to the public the management of the companies by which the enlarged distribution was ordered.

Much of the current comment upon the condition of railway interests relates also to the decline of prices on the Stock Exchange and the sharp and sudden depression of the 14th inst. Much argument is based upon the assumption that this movement of Exchange prices has been a natural one, due to the sale of shares by persons who really owned them. Obviously, there have been reasons for some measure of liquidation. In addition to those of which we have already spoken, there have been the restrictive legislation of States and the gloomy predictions of railway officers and capitalists, especially of some who were under indictment. While these influences would account for a gradual downward movement of share prices, even in the face of general prosperity, they do not explain what has taken place. To account for the enormous transactions and the panicky fall of quotations, one must be familiar with the methods of

those who sell what they do not own, and with the power that can be exerted in the Exchange market by the skilful and relentless use of great quantities of capital.

After fair allowance has been made for legitimate sales by discouraged holders, and also for the "short" sales of a brood of small speculators who magnify depressing influences and take advantage of the actual sellers' fright, there remains (in these recent transactions) a volume of "trading" which can be explained only by the assumption that speculative capitalists of the first rank were at work. Was it their main purpose to make great profits? Or was it their aim to furnish proof that their own predictions had been warranted, and to exert influence upon some person or the public at large? They may have had all these purposes in view. In considering the relation of stock market depression to current railway problems, it should be borne in mind that the recent movement was due mainly to the operations of giant speculators.

It was not in accord with commercial and industrial conditions thruout the United States. Of this there is ample proof in the current reports of all the authorities to which we look for trustworthy information about production and trade.

We do not overlook the character of pending or completed railway legislation in the States. The probable effect of it upon the companies has been exaggerated by railway officers, but a part of it has been unwisely projected and hastily pushed to enactment. Railway capitalists who asserted not long ago that the Rate bill at Washington was an example of unwise and unjust centralization, now assert with as much emphasis their conviction that the supervision and regulation of railroads ought to be an exclusive function of the National Government.

This is said to be the opinion of Mr. Roosevelt. His program of legislation to be recommended to the new Congress includes, it is understood, a bill for supervision by means of Federal license. It also includes some other things. So far as it tends to substitute uniform and reasonable Federal restraint for hasty legislation in the States, it may win the approval of the railway capitalists themselves. But he would have also an official valuation of all the railway properties. He would not only prevent overcapitalization in the future, but also provide some cure for the evils of overcapitalization in the past. In this he will be opposed by the railway managers who now prefer the exercise of centralized power to the acts of State legislatures. Eventually their opposition will be overcome. The latest proof that such laws as Mr. Roosevelt has in mind are needed has been furnished by the Harriman investigation.

Mrs. Sage's Gift

MR. CARNEGIE has given his many millions for libraries and institutions of learning; Mr. Rockefeller has given his for education; Mrs. Sage gives her ten millions for "the improvement of social and living conditions in the United States." That is a very general statement of a very wide purpose. It underlies all the betterment of society and humanity. The further explanation of its purpose shows that its main work will be to study the causes of poverty and relieve its burden. It is not intended, like aid to education, to assist the ambitious and competent into superior success, but to consider the incompetent or the unfortunate, those who have been ground down by present social conditions, and to lift them back into courage and comfort.

For we are told, in the very admirably published statement, that it will "study the causes of adverse social conditions, including ignorance, poverty and vice," and may establish and maintain "charitable and beneficial activities," with a view to taking up "the large and more difficult problems." The scope of the plan is so broad that it can do anything whatever to relieve evil social conditions. It is left to a wise and experienced board to do this in any form they think best. There is no better way that those can take who have large wealth to give, but who do not feel that they have the experience to judge how best to distribute it; but we recall no other benefaction in which so great liberty is left to the trustees. Indeed, there seems to be no real limitations.

Yet the point of view probably will somewhat definitely direct the expendi-

ture of the income of this fund which may be $400,000 a year. Mrs. Sage is not looking at the magnificent forces which, working from the top, lift up all that is below, but at the evils and wrongs which exist at the bottom of society, and which grind so many people with desperate poverty and suffering. We are very sure that the money will all go to make poverty tolerable, and to relieve suffering. It is the submerged tenth that will be considered, and no one else. And we are glad that it is so, that they are not to be forgotten.

An apparently inspired interview on the subject tells us more definitely that we are learning that poverty arises from other causes than defects of character, such as drinking habits and shiftlessness. We are told that in the present complex social conditions an upright average citizen may find himself, thru no fault of his own, unable to support his family. He may develop tuberculosis. He cannot afford to go to a sanitarium, but this fund might provide for his case. The poor pay more for their fuel and food than the rich, because they have to buy coal by the pailful, and food by the meal. Provision might be made by which they could purchase what they need at wholesale rates. In the same way some plan might supply her little insurance to a poor scrubwoman, who gets but five or six dollars a week, at a cheaper rate than that which now allows a company "to put up a magnificent $15,000,000 building and pay big salaries and dividends."

These are suggestions, and they make us think; and they will make the trustees of the fund think. What are the underlying causes of poverty other than bad habits and shiftlessness? For these latter the cure is law, which will restrain from vice by removing either its temptations or its victims, and will send to workhouses those who can work but will not. Nothing but force can reach them. Some must be made to break stone; prohibition must shut the dramshops to others. But what change in social conditions can save those who would earn a living but cannot? The poorhouse is a barbarous relic in our civilization. The honest poor should not be shamed. But how can this new board help these poor without really doing more hurt than good? If these poor can be supplied with cheaper coal and food will not their wages be cut down again to the lowest vital limit? After all is not the assurance of fair wages for all who are able to work, and public provision for those who cannot work the only remedy under the present social system? And this again brings up the question, which at present seems impossible of solution, How can steady wages for all at remunerative rates be provided? Socialism has its easy answer, but with it come other dangers which we fear to face, chief among which is the apprehension of the laws of liberty, the advent of collective tyranny. But, putting Socialism aside, as we judge this board will do for many years, the basal question must be finally met, which asks how under our present social system a man or woman can be sure of continuous employment at wages that will support him and his family. The other remedies which this board will consider are important, for the present, but are only palliative. Palliatives are good, but we seek curatives. Yet even so, the task put on this board is of vast importance, and we are very grateful to Mrs. Sage and her wise advisers that it is to be taken up. The country will watch their expert investigation and be eager to learn their conclusions. And yet we shall ask whether the trustees are seeking to cure a long chronic disease, or are only giving opiates to make the condition of the sufferer more tolerable.

The Insurance of Reputations

THE field of insurance is being extended rapidly nowadays, but it has not exhausted its possibilities. A conspicuous omission is the neglect to make any provision for the insurance of reputations. A man's reputation is the most fragile and precious of his possessions, more valuable than his house, dearer to him even than his life, yet how easily it is destroyed, often thru no fault of his own. Plate glass is tough in comparison to popularity. The fickle favor of the mob is as liable to let a man drop suddenly as an elevator.

"Who steals my purse steals trash, . . . But he that filches from me my good name

Robs me of that which not enriches him
And makes me poor indeed."

But against the breaking of the windows of our glass houses, against the falling of our elevators and against burglars of our material possessions we have insurance, while no such protection is afforded to our reputations.

Were a company established for this purpose it would do as much to equalize the vicissitudes of fortune and to level the course of life as any other form of insurance. "In time of prosperity prepare for adversity" would be the motto of this new insurance as it is of the old. Every statesman at the zenith of his popularity, every general after winning a great victory, every actor while basking in the smiles of the matinée girls, and every author whose novel reached the 100,000 mark, would, as a matter of course, take out insurance, realizing that they cannot long stand in the limelight and that cheers are as naturally followed by jeers as lightning is followed by thunder. Then when the evil days come and the crowd bows before other idols, they could retire on a pension, and "let the jingling of the guinea heal the hurt that honor feels."

If, for example, Dewey had insured himself immediately after the battle of Manila Bay, and Hobson after the sinking of the *Merrimac*, they would at least have had some pecuniary compensation during their eclipse, fortunately temporary, from the sun of popular favor. When Port Arthur fell the world rang with the valor of its defenders. General Stoessel was rewarded for his bravery by the Kaiser. Now he is condemned by a court martial as a coward and a traitor to his country, saved from an ignominious death only by the clemency of the Czar. Military reputation, total loss; no insurance. The beginning of our Civil War affords similar instances to prove that all who seek the bubble reputation at the cannon's mouth should see that the bubble is insured.

And it is the same in all lines. Bismarck, Gladstone, Cæsar, Depew, Parnell, Grant, Wilde, Tupper, Job, Kipling, Napoleon I and III, Witte, McCurdy, the list of those whom fortune's wheel has raised and lowered can be extended indefinitely by any reader. Religious leaders especially should take out reputation policies; Madame Blavatsky, before Dr. Hodgson of the Society for Psychical Research investigated her, and Dowie, before he attempted to convert New York City. Crœsus, as he was chained to the burning pyre, realized what Solon meant when he said "Count no man happy till his death." Our modern Crœsuses would have to carry heavy insurance against popular envy, hatred, malice and all uncharitableness. Life insurance companies charge extra premium in the case one's calling takes him to the tropics. The same rule would doubtless apply in the insurance of reputations, especially for engineers on the Panama Canal.

True insurance is protective as well as compensatory. When a man applied for the insurance of his reputation the experienced examiner would, of course, point to him the dangers in his future career or the defects in his character liable to get him into trouble, and would insist on certain precautions in his conduct. All the while the policy was in force the company would watch over him carefully, warning him against impolitic acts and remarks, and threatening him with forfeiture of insurance if he persisted in his reckless conduct, somewhat as the fidelity insurance companies now act as the guardian angels of the bank clerks who hold their policies. Insurance companies have shown that they can do much to influence public opinion thru the discreet manipulation of the press by means of paid editorials and news items. This influence would be invaluable in the business of insuring reputations; and in case of an attack upon the character of a policy-holder the company would at once bring a libel suit against the newspaper publishing it and push to the bitter end with all the force of unlimited money and the best legal talent. If the candidate for public office could engrave on the corner of his card "Reputation insured in such-and-such companies," it would do much toward freeing the campaign of personalities. The assessing of the amount of damage a reputation had suffered, either by a change in the fashion of the heroes worshipped, or by an unpopular action or ridiculous blunder, would be difficult

sometimes, but we cannot think it beyond the power of Lloyd's calculus. Of course no reputation would be insured for more than two-thirds of its value. In the case of derelict authors, artists and actors, left stranded by the shifting of popular taste, it could be measured rather easily by the decrease in earning power. Just as fire insurance covers the damage, often greater, done by the water used to put the fire out, so the new insurance would protect one against injudicious friends as well as enemies. This, indeed, would be one of its greatest advantages. Only one possible objection to this scheme occurs to us; that is, who would insure the reputation of the insurance companies? They need it as much as any of us.

The Self-Education of the People

The real education of a people is a product of its own struggle for existence.

Whatever it may have obtained from historical sources, and whatever it may have been taught by those set apart and appointed to instruct children and youth, a people has to find out for itself what it can make of the natural resources of its environment, how it can mix and blend the miscellaneous elements of its population, and in so doing it has to re-think and reformulate the wisdom that has been transmitted to it from the experience of the race.

In America, the processes of popular self-education are going on actively and in interesting variety.

The political, legal and moral education is at this moment the most apparent phase. Whatever the differences of opinion about Mr. Roosevelt's wisdom, no one disputes his marvelous power and versatility. A personality so vital, so tremendously interested in so many things, so positive in his convictions, and so fearless in pushing his plans to realization, does not stand at the administrative center of national affairs once in a century. This fact in itself compels the people to think about their political problems, and especially those that are related to business matters, with a new seriousness which carries with it fresh keenness of perception.

But such a personality would play no such part in popular education as Mr. Roosevelt does under conditions different from those which exist in America today, and which have been created directly by the activity of the population in developing its economic opportunities. The enormous increase of agricultural production, of mining output, of manufacturing, of railway building and operation since the Civil War has brought with it those manifestations of individual and corporate ruthlessness, those violations of law and the moral code which have in recent years become the exhaustless material for a sensational literature of exposure. It is the contemplation of all these things, and the universal grappling with them by public opinion, as focused by Mr. Roosevelt's leadership, that constitutes today one of the chief factors in American popular education.

Next in importance to this political, legal and moral element in our educational process should be named the steadily increasing and widely diffused interest of the great agricultural population of the Middle West and the South in the practical problem of using the soil to the utmost advantage and of selecting and breeding those vegetal and animal products that are best suited to our lands and our markets. Scientific knowledge and the work of the agricultural colleges and experiment stations thruout the country are marvelously transforming both the economic condition and the mind of the agricultural population. The net result can be stated in a word. The American farmers are ceasing to be at the mercy of the elements. Dry and wet seasons no longer carry with them the same fatefulness that they once did. The farmer begins to understand that his fate is almost entirely in his own hands. He knows that he can be sure of the product of his own foresight, intelligence and industry, and he becomes thereby, as a thinking being, less superstitious, less the victim of alternating fear and hope, more the reasoning, calculating, scientific man of the world.

Can we say that popular education in those things that constitute the idealism, the refinement, the grace and the charm of a people is likewise going forward under the impulse of some fresh vitality

created by the conditions of our existence? This is a more difficult question to answer, but indications are not lacking that much real progress is being made. There is obviously an increasing consciousness that American materialism is more than a carping phrase. There is a growing feeling of need for attention to disinterestedness, to beauty, to manner and form. Movements for the preservation of natural beauty, for the esthetic transformation of towns and cities, for the quickening of art impulses are meeting with an increasingly gratifying response. For a long time the absorption of attention in the great economic and political problems that now confront us will prevent that generous devotion of thought and strength to the esthetic and idealistic interests which is necessary to lift a people to historic greatness in the realm of poetic and artistic creation. But toward those hights we are making a measure of cheering advance.

A Cardinal Academician

We have at hand the text of the oration of Cardinal Mathieu in honor of his predecessor in the French Academy, Cardinal Perraud, and the response of Count d'Haussonville in welcoming the new member. We are not surprised that both of these distinguished French Catholics offended the *reactionnaires* of the Church, and that the stanch monarchical organs have frankly expressed their dissatisfaction.

Cardinal Mathieu, Archbishop of Toulouse, takes the *fauteuil* in the Academy occupied by Cardinal Perraud, Bishop of Autun. It was the duty of the new member on taking his seat to present a eulogy on his predecessor, and Cardinal Mathieu did it in such a way as to indicate his sympathy with the liberal views of Cardinal Perraud. In his youth Perraud owed much to the inspiration of his teacher, Gratry—a disciple of Lammenais and Lacordaire—a theologian who was charged with modern views in philosophy, but his friendship Perraud refused to discard, even when it came near losing him ecclesiastical promotion. The Papal Nuncio objected to his nomination as Bishop of Autun, because he had joined Gratry in opposing infallibility, but Perraud replied: "If I were offered ten miters I would not disavow the man to whom I owe my faith and my call to the priesthood." This touch of liberalism in Perraud Cardinal Mathieu commends, as also his joining with Gratry in the opening of the Oratoire, where the purpose of the much-questioned preaching was "to enroll liberty, art and progress in all its forms in the service of Jesus Christ."

But it was the response of the Count d'Haussonville, and his eulogy of Cardinal Mathieu and his writings, which has offended the Royalist and Ultramontane journals. Before he was created Cardinal, Mathieu had published two volumes on French history, in which he had spoken some good words of the Revolution. He did not denounce it as all the work of the devil, but declared that society was previously suffering from such profound evils that one could almost say that it needed a "revolution." Yet those were the Royalist days so dear to French ecclesiastics. He even added that the basal purpose of the Revolution, however great its evils and cruelties, its declaration of the rights of man, was of the essential spirit of Christianity. Count d'Haussonville particularly offends the *reactionnaires* by quoting what was said once of Cardinal Consalvi, who had the power to make Rome learn that "the world moves." "Under that red *calotte,* Monsieur, there are liberal ideas"; and then turning to Cardinal Mathieu, he said: "You need not take off your *calotte* to show that under it there are ideas no less liberal than those of Consalvi."

It may be fairly gathered that on such an occasion Count d'Haussonville was careful not to say anything that would offend the Cardinal whom he was addressing. Therefore of no little interest is his strong language as to the evils of the Concordat, and we can hardly fail to discover a satisfaction that the Church is now free, whatever the wrongs of the legislation which freed it. We recall that Count d'Haussonville was one of those who signed, with

M. Brunetière, the famous address to the Pope in favor of conciliation. He says:

"Allow me to cherish the dream of a French Church which will ask nothing from the State and will draw its resources solely from the generosity of Catholics, in which the pastors will live in intimate communion with the faithful, to whom they will no longer appear as inaccessible officials (*lointains fonctionnaires*) in whose lot one would be entitled to take no interest, in which the faithful themselves will not be considered as a dumb flock of contributors, but, on the contrary, associated, as far as respect for the hierarchy would permit, in the management of temporal property, in which the House of God, built, kept in repair, and ornamented at the expense of all, should remain the house of all. In my humble judgment this transformation forces itself upon the Church, at all events in France. The day that the Church decides to draw from the heart of the people the elements of its life, like a transplanted tree which plunges afresh its roots in the bowels of the earth, it will recover vigor and its rejuvenated trunk will put forth verdant branches in a cloudless sky."

This noble and eloquent passage must express the better anticipations of the more liberal French clergy. If, as we believe, it fairly expresses the views also of Cardinal Mathieu, we can well understand how it is that the bishops are far from being as irreconcilable as is the Pope, and that they would easily come to an understanding with the Government if they were not forbidden by a higher authority at Rome. The misfortune is that nowadays Rome seems to include all questions, whether political or social, under the category of religious, and to claim to bind the believers. Thus we learn that it is against religion for churches to have trustees, against religion for the priest to be responsible for the repair of the sacred buildings, against religion for the State to forbid foreigners and members of the orders to be priests of French parishes, even altho canon law makes the same prohibition.

The Presage of Spring in the City

Every year, some time about the middle of March, comes a certain joyous day. It has no distinctive name, and it is not marked on the calendar. It is the day which announces the approaching end of winter and the near arrival of spring. There may be snow on the ground, the air may be somewhat chill, there may be no smallest leaf showing on shrub or tree; but out of the shifting mood of light and air come indefinable but unmistakable signs of what is to be. Touched by this environing mood of the day, one may in imagination see the airy forces of winter raising their long siege and preparing to retreat to the northland, while from the southland, sweeping over plain and wood, come the viewless battalions of spring.

Such a day in this city was last Saturday. The snow had not yet been entirely cleaned from the streets, while in the parks it lay in irregular heaps and patches. But the sun, strong and clear, issued out of his wintry door, within which he has been keeping himself like an Oriental monarch these last three months, and showered upon the city a largess of liquid gold. Tho the air was slightly chill, it was charged with an indefinable balminess, and the dullest sense was made aware that another winter was passing to its end.

Madison Square is in the heart of the city. Towering buildings encompass it. It lies like a tiny mesa surrounded by mountains which are cleft by deep ravines. Here, in the early morning of such a day, an observer may get a memorable effect if he have an inward sense to complement his seeing and hearing. Seated upon a park bench, you look above at the wide-spreading nets of black branched limbs and thru them at the sky. Not a cloud rests on its pure surface. Like a blue sea, flooded with a golden light, and foamless and quiet, it smiles down upon you. At your feet are patches of melting snow, and here and there, among the tufts of brown grass, a few frail shoots of green sparkle with a dewy radiance.

There are as yet no winged heralds of spring, flashing in their fresh plumage from tree to tree. The robin and the bluebird are yet on their way north. But all about you is a blithe babel of voices from flocks of little sparrows. They have been here all the winter. Cold and dark days have no terrors for them. But now a new impulse has been communicated to their blood, and they romp about in a kind of mad riot thru the flooding sunshine.

And now the sun has climbed nearer

the zenith, the air has grown softer, the shadows about the columns and walls in the distance have disappeared, and the sunlight lies warmly upon every observable thing. You look upon shrub or tree, and you know what is going on within their fibers. The sap, the tree-blood, which has lain dormant so long, begins again to stir, the tree-nerves throb again, and with half-closed eyes you can see leaf and bud putting forth from their shaggy sheaths. The flowery May is presaged in every sight and sound that comes to you.

In the deep woods you will, of course, see a greater pageantry attend the coming of spring. It is here that spring loves to dress nature with an Orient excess. But it is in a more human guise, with a sort of mother tenderness, that spring comes to the shut-in souls among the walls of a great city.

Hopeful Signs

From time to time it has been the duty of The Independent to call attention to the lack of justice and mercy in the dealings of the whites in the South with their neighbors, dependants and fellow citizens the negroes. Nor would we neglect on the other hand to report many hopeful signs of a better feeling and more friendly adjustment of their mutual difficulties. This we have lately done in reporting Governor Northen's campaign in Georgia. The following incidents have recently came to our notice, properly vouched for, and altho the names are withheld here, we have them in our possession:

During the recent race riots in Atlanta, the streets of a certain suburb were patroled night and day by police, and bands of men were abroad looking for a negro who had committed the atrocious crime near this place. The better class of negroes becoming alarmed for their safety went in a body to their white neighbors and asked for protection. They were at once taken into the homes of their white friends, one of them John Temple Graves, where they slept night after night till all danger was past.

In another town less than fifty miles away a negro man met a white woman in a buggy and insulted her. She escaped by driving rapidly. The husband of this woman went to two or three influential negroes and told them what had happened. They immediately arrested the culprit, empaneled a court, with a jury of negro men, took her testimony and his, and after a fair trial they found him guilty. They gave him the choice between being prosecuted in the courts or receiving twenty-five lashes. He chose the latter and the negroes administered the flogging. They have given assurance to the town that hereafter they will be glad to atend immediately to "all such cases to the best of their knowledge and ability." But, whereas this community has been notorious for the bad behavior of its negro citizens, no offenses have been committed since this announcement.

Now we all know how prone Hell is to break loose in Georgia, and how even when the people take a notion to abide by the law, they cannot always do it till they get it into their own hands, and far be it from us to recommend such dangerous practice, but we do claim that these incidents intimate a more intelligent and kindly relation between the whites and blacks than could be gathered from the lurid details published at the time of the trouble.

London's Lost Letter

In our issue of February 14th we published a series of remarkable coincidences in thought and language between Jack London's "Call of the Wild" and Dr. Egerton R. Young's "My Dogs in the Northland," which had appeared several years earlier than Mr. London's story. Mr. London in his comment said: "So far as the source of much of my material [having been Mr. Young's book], I plead guilty. A couple of years ago, in the course of writing to Mr. Young, I mentioned the same fact, and thanked him for the use his book has been to me." This letter of Mr. London's acknowledging his indebtedness for much of his material to the genial missionary doctor of the Northland, written a year and a half after the publication of "The Call of the Wild," seems to have gone astray, for Dr. Young writes as follows to Mrs. Bosworth,

whose article in THE INDEPENDENT called attention to the parallelism:

DEAR MRS. BOSWORTH—A friend has had the kindness to send me a copy of your painstaking article in the New York INDEPENDENT concerning Jack London's plagiarism of so much of "My Dogs in the Northland."

When I read "The Call of the Wild," of course I noticed the similarity of much that was in it, to what, from my long experience, I had written, but in my *charity*, and, I now presume, *simplicity*, I had supposed that, like myself, Jack London had undergone similar experiences during long years in some Arctic regions, and had written his book as the *result* of *what* he *had seen* and *suffered*. So I naturally congratulated myself that such a famous writer, from actual experience, should so endorse my assertions.

The more serious part of the matter is the statement: "In the course of writing to Mr. Young I mentioned," etc. Well, the fact is, I never had any letter or communication, directly or indirectly, from Jack London. In fact, as the name is so peculiar, I was partly under the impression that it was only a *nom-de-plume*. . . . *How* he would explain this I can hardly surmise, and I am not even going to trouble him for an answer.

EGERTON R. YOUNG.

Helicon Hall Burned

Our readers have an especial interest in Helicon Hall, since it was Upton's Sinclair's article in THE INDEPENDENT, June 14th, 1906, on the difficulties of housekeeping and child-raising under modern conditions that led to the starting of this experiment in co-operative living, and again in our issue of February 7, 1907, he told of its six months' success and favorable prospects. But on the night of March 15th the handsome building was totally destroyed by fire of unknown origin. All of the colonists had a narrow escape. Several were badly burned or sprained, and Mr. Briggs, a carpenter, was killed. Coming as it does at a critical period in the life of the colony, the disaster may put an end to this interesting experiment. Helicon Hall has often been compared with Brook Farm. The analogy will be still closer if the burning of the building breaks up the community. The growth of cities and the development of steel architecture have made something like Fourier's phalanstery inevitable. The only question is whether it will be capitalistic or co-operative. So far the only successful phalansteries are capitalistic, the modern apartment houses, which are objectionable in several ways. It would, therefore, be a great pity if this accident should nip in the bud the only attempt to establish a co-operative phalanstery.

Senator Bailey's Vengeance

The Texas papers print in full Senator Bailey's speech to the Texas Legislature when, by a majority vote, he had been acquitted of the crime of paid subserviency to the railroads. In that speech he freely let out all the venom in his soul. He threatened those who had accused him. This was what he said:

"Mark my words, not one of the men who organized and sought to accomplish this conspiracy will ever again wear the honors of Texas Democracy. . . . The leader of the contest was a man who has gambled with negroes, and if he dares to deny it I will prove it on him. . . . One of them committed an embezzlement. . . . If I might borrow a sentiment from the great infidel, Robert G. Ingersoll, I would say that I sometimes wish that I might possess words of pure hate, words that would writhe and hiss like snakes, for thus only could I express my opinion of these men. . . . If I live I will devote my best energies to seeing that not one of their kind goes as a delegate to the National Convention. If I live, not one of their kind will ever again disgrace the State of Texas by holding an office under its authority. . . . I never intend to retire until all of them are buried, politically speaking. . . . . We are going to bury them face downward, so that the harder they scratch to get out the deeper they will go toward their eternal resting place. . . . They have drawn the line. Let us take our place on the side of Christian Democrats, while they take their side with the infidel Republicans and Socialists. . . . The Lieutenant Governor packed the Senate Committee on Investigation against me. I will pay him for it. If God lets me live I will pay him for it. . . . I warn you that the man who does not hate his enemies never loves his friends. . . . In my home I intend to put the photograph of this Legislature. Two pictures will embrace that photograph. Over the one I am going to write 'The Roll of Honor.' Over the other I am going to write, 'The Rogues' Gallery,' . . . and I am going to swear my children never to forget the one or to forgive the other."

Thus, in a Christian spirit, he consigns his enemies, who, he says, are the emissaries of Hearst, to Populism and the Pit. Possibly he may regret later that he did not suppress his bile as once did Dr. Newman Hall, who wrote a bitter pamphlet against a critic. He read it to a distinguished clergyman, who praised it and asked him if he had considered the title. He had not, and his friend suggested, "Go to the Devil; by the author of 'Come to Jesus.'"

As the Old Cock Crows

There is a commonly expressed hope that somehow the condition of society is going to be improved, without any radical change in legislation, by the fact that the next generation of privileged people is going to be less grasping and more generous. Here is a true story of an incident that may be taken as a straw in the wind. A certain future capitalist, now aged seven, came home the other day and told his father, a wealthy business man, that he had "done business" with a certain poor little boy in the neighborhood. This poor boy had informed him that they had a new baby at their house but that they had no baby carriage for it. Whereupon the rich man's son remembered that there was in the barn at home an old worn-out baby carriage that he and his small brother had used. He told the poor boy that he could have this old carriage in exchange for a rooster and two hens. Then he thought that that was not enough. So he said that the father of the poor boy must come and work for his father, helping the gardener for a day. The next day he came and the business man, instead of reproving his son, commended him for his business sagacity.

"As the old cocks crows, sae the young one learns.
Tak' guid care what ye' dae before bairns,
For their heeds are muckle tho their limbs are wee,
And Ah, the wee tots, they're sae gleg o' the ee."

A View of the Clergy

Mr. William Winter is angry because a Pennsylvania clergyman has misrepresented his views as to the dramatic profession. He replies in a letter in *The Tribune,* which makes mincemeat of the poor clergyman, whose statement was "an impudent calumny." Mr. Winter tells us that he has been a writer on the theater for more than fifty years, forty-two years on *The Tribune,* and his writings on the subject "fill more than fifty huge volumes." So "any person who designates me as an enemy of the stage is either an ignoramus, a fool, or a malicious liar." Then Mr. Winter turns from this single clergyman upon his profession. He is "weary of the babble of clergymen about the theater." They know nothing about it. He believes "the theater as an institution to be as powerful for good as the pulpit is, and I know it is far more interesting." "The members of the dramatic profession, as a class, are as moral and as respectable as the members of the clergy." And he concludes:

"I also think that Lord Clarendon was right when he expressed the opinion that clergymen, as a class, in their meddlesome interference with public affairs, are the most mischievous people in the world."

We have observed that such is the view held by others than Lord Clarendon and William Winter. It is that of the Tammany leaders, and was expressed by the Saloon opponents of the Bishops' Act before the New Jersey Legislature the other day.

The San Francisco School Board has taken the Japanese children into their schools, as promised by Mayor Schmitz to President Roosevelt, and the President has, as promised, withdrawn the suit which was to settle the legal question. But there is not a bit of generosity in the San Francisco concession, for the Koreans are still shut out, and must go with the Chinese to an Oriental school. Somehow we feel no hilarity over this victory, and we doubt if the President feels like chuckling. All was done in accordance with this message sent to President Roosevelt:

"At regular meeting Board of Education tomorrow resolutions agreed upon will be adopted. Would suggest notice of dismissal of suit by you same day. Will live up to spirit and letter of agreement.

"EUGENE SCHMITZ, Mayor."

From this time forth, by the consolidation with it of Allegheny City, Pittsburg is, and is likely to continue, the sixth city in the United States. It surpasses in population Cincinnati, San Francisco, Buffalo and Cleveland, and is surpassed only by New York, Chicago, Philadelphia, St. Louis and Boston, with Baltimore a close rival.

A committee of New York clergymen, worried by the decline in attendance at religious services, have called upon President Roosevelt to fill their pews. The President has promised to assist them, which he will probably do in his usual way, by sending Secretary Taft.

Insurance

Equitable Life Assurance Society

At the recently held annual meeting of the Equitable Life Assurance Society, the financial statement of the company was made public and certain promotions of officers were announced which cannot fail to be of public interest. Paul Morton was re-elected president. William A. Day, who entered the service of the company about two years ago as vice-president and comptroller, was elected first vice-president. Mr. Day was born in Wilmington, Del., in 1850, and was educated in the public schools and a classical academy in Delaware and the Harvard Law School. He subsequently practiced law in Illinois and was Auditor of the Treasurer under President Cleveland and counsel to the Interstate Commerce Commission. He has been special Assistant Attorney-General and was the first Assistant Attorney-General under Attorney-Generals Knox and Moody. George T. Wilson, formerly third vice-president, who entered the service of the company as a boy and has risen thru merit step by step, was elected second vice-president. Charles E. Phelps, from Iowa, who has been trained in the railroad business, having been in the service of the C., B. & Q. Railroad under President Morton and who entered the service of the Equitable a year ago as assistant secretary, has been elected treasurer. Gerald R. Brown, the deputy comptroller, was elected comptroller. Mr. Brown came to the Equitable in January of 1876 as a boy to the usher, studied stenography, became private secretary to vice-president Samuel Barrowe, attended to the collecting of rents and rose step by step, taking charge of the real estate and finally became superintendent of the bond and mortgage departments and deputy comptroller. All the promotions are heartily approved, and tend to give increased confidence to the administration of President Morton.

In connection with the foregoing, a report issued on March 1st, over the signature of President Morton, contains the highly interesting, as well as significant statement that the Equitable Life has never since its existence been in better financial condition than at the present time, nor have its assets ever been more securely invested. The total assets on January 1st aggregated $434,582,375, which is an increase of over $14,000,000. Increases in responsibility were made in every direction, notwithstanding the exceedingly adverse conditions which have existed in insurance circles and which still exist. The Society is complying with the spirit as well as the letter of the new insurance laws of this State in the endeavor to so manage the Equitable Life that it will continue to commend itself to the insuring public. The Equitable Society, under the administration of Paul Morton, has fully justified the hopes of its friends and well wishers, and is easily maintaining its old place as one of the three giants.

The New York Life Insurance Company in some of its recent literature calls attention to the fact that the present year has thus far been characterized by a remarkably large number of disasters, that have been exceedingly costly in human life. Here is a list of some of the more important ones since the first of January, which is highly significant from a life insurance standpoint, viz.:

	Killed.
Jan. 2—Rock Island Railroad Wreck..	35
Jan. 14—Kingston Earthquake	1,000
Jan. 19—"Big Four" Railroad Wreck...	52
Jan. 22—New York Central Railroad Wreck	7
Jan. 29—Boston & Maine Railroad Wreck	6
Jan. 30—West Virginia Mine Explosion.	91
Feb. 8—Wilkes-Barre Mine Explosion..	7
Feb. 12—Steamship "Larchmont" Sunk.	100
Feb. 16—New York Central Railroad Wreck	23
Feb. 18—Mexican Mine Explosion.....	100
Feb. 21—Steamship "Berlin" Wrecked...	130
Feb. 23—Pennsylvania Railroad Wreck..	—

In addition to these the minor railroad accidents have added 50 dead to the list. There have also been a number of barges and small craft sunk along the coast, drowning about a score of men all told.

Financial

The Movement in Stocks

On the 14th the culmination of the recent decline in current values on the Stock Exchange was reached in a panicky market. Sales on the 12th had been only a little more than 800,000 shares. The number was nearly 2,300,000 on the 13th, and on the 14th it rose to 2,540,000, while losses in leading stocks ranged from 5 to 20 points. Below are shown the highest quotations of sixteen representative securities in 1906, the lowest quotations on the 14th, and the loss (on that date) since January 1st:

	Highest, 1906.	Lowest, Mar. 14.	Loss Since Jan. 1.
Atchison	110½	93	23
Balt. & Ohio.....	125⅛	95	26
Brooklyn R. T.....	94⅛	45¼	34
St. Paul	199⅝	125	24⅝
Great Northern...	348	132	57¾
Missouri Pac.....	106¾	64	28¼
N. Y. Central.....	156¼	111½	20⅜
North. Pac.....	232½	115	73
Pennsylvania	147½	114	24¾
Reading	164	91	44½
South. Pac.....	97½	69¾	23⅜
Union Pac.....	195⅜	120¼	60¼
Amalg. Copper....	118¼	80	35½
Anaconda	75	53	19¾
U. S. Steel.....	50¼	33	15½
U. S. Steel, pref...	113¼	95½	9⅜

On the 15th there was a sharp recovery. This was continued on the 16th, and the week ended with advances from Thursday's lowest which ranged all the way from 4 to 18 points. At last accounts no failures in the financial district had been reported. Business conditions thruout the country continue to be excellent, as a rule. Spring trade is expanding, and leading industries have orders covering their production for a long time to come.

Annual Steel Report

The annual report of that great company, the United States Steel Corporation, issued last week, clearly shows the extraordinary activity of business in 1906. Gross earnings were $696,756,926, an increase of $111,425,190, or 19 per cent. A gain of $36,836,614, or more than 30 per cent., made the net earnings $156,624,273. The average of prices received was about 5 per cent. higher than in 1905. A considerable advance might have been warranted by higher wages and freight rates, but the company pursued a conservative course. It is interesting to know that the orders received since January 1st, 1907, have exceeded in volume those received in the corresponding months of 1906. By the addition of 22,289 the number of employees has been increased to 202,457. Wage payments were $147,765,540, or more by 15½ per cent. than in 1905. This was due in part to an increase of wage rates amounting to about $6,000,000 in a year. Exports were 1,079,319 tons, an increase of 13 per cent. An interesting account of work on the new plant and town at Gary, Ind., is given. For this work nearly $5,000,000 was expended last year, and $40,000,000 more is to be spent upon projects there already planned and approved. This year, as in years past, the company is to be commended for the frankness and comprehensive character of its official statement.

....It is shown by the statement issued with the usual quarterly dividend of the Western Union Telegraph Company that after payment of the dividend the surplus will remain practically unchanged, being $17,024,904, against $17,026,616 on December 31st.

....Frank W. Kinsman, Jr., who for the past five years has been president of the Hamilton Bank, was recently elected president of the New Amsterdam National Bank, of which Charles W. Morse is vice-president. Mr. Kinsman was born in Augusta, Me., and previous to his connection with the Hamilton Bank was a director and one of the organizers of the Fourteenth Street Bank. In 1901 he sold out the controlling interest in the Hamilton Bank. The other vice-president of the New Amsterdam Bank is John G. Hemerich, who was born in New York in 1870. He was connected with the Lenox Hill Bank for one year and with the Fourteenth Street Bank for two years, and he entered the employ of the New Amsterdam Bank in 1900. Edward O. Eldredge continues as cashier. The capital of the New Amsterdam is $1,000,000, its surplus is $200,000, and its total resources are $8,268,576.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Municipal Corruption in San Francisco

Nearly one hundred indictments filed with the Superior Court in San Francisco last week reveal municipal corruption so extensive and foul that even the most sensational statements published after the arrest of Mayor Schmitz and Boss Ruef now appear to have been well within the bounds of truth. Evidence thus far laid before the grand jury by confessions and otherwise proves the payment of more than $800,000 in bribes to municipal and county officers. The work of detection has been done by Francis J. Heney, who successfully prosecuted the public land thieves in Oregon and elsewhere, and by Secret Service Agent William J. Burns. San Francisco's Board of Supervisors has eighteen members; seventeen of them, all guilty of taking bribes, have made full confession to the grand jury. George F. Duffey, who was a member when the bribes were paid, is now president of the Board of Public Works. It is said that he can gain immunity only by adding to a confession as to his offenses as a supervisor, a further confession concerning similar corruption in the department over which he now presides. The first confession is said to have been made by Supervisor Thomas F. Lonergan. Supervisor W. W. Sanderson, being ill and fearing that he was on his deathbed, added his story to Lonergan's. Then all their associates hastened to confess in order that they might obtain such measure of immunity as the prosecutor would offer. The bribes to which the indictments thus far filed relate were given in connection with certain franchises. The money was first paid to Abraham Ruef. In most cases he paid a part of it to Supervisor James L. Gallagher, who distributed it among the supervisors. The portion retained by Ruef is said to have been divided between him and Mayor Schmitz. Gallagher was Acting Mayor during Schmitz's recent visit to Washington and the conferences there with President Roosevelt concerning the Japanese school children. On the 20th, seventy-five indictments were filed, and twenty-two were added on the 23d. They involve the United Railroads Company (controlling the street railways of the city), the Gas and Electric Company, the Home Telephone Company, the Pacific States Telephone and Telegraph Company, and what is called the Fight Trust, a combination of four men who bought an exclusive privilege of conducting prize fights in the city, their franchise permitting twelve such fights in a year. After the earthquake, the street railway company, which had been using cables, sought a franchise for the use of overhead trolleys. It is understood that some one placed in Ruef's hands $450,000 to be used in obtaining such a franchise. There are sixty-five indictments against Ruef; seventeen of them relate to this matter. They assert that he paid (for the desired votes) $15,000 to Gallagher, $10,000 to Andrew M. Wilson (now a State Railroad Commissioner), and $4,000 to each of fifteen other supervisors. It is said, but not in the indictments, that he shared the remainder with Mayor Schmitz. The Home Telephone Company wanted a franchise for competition with the Pacific States Company,

which monopolized the business. In this case there was a contest of corruptionists. In thirteen of the Ruef indictments it is charged that he bribed thirteen supervisors in the interest of the Home Company, paying $6,000 apiece to four of them, and $3,500 apiece to nine others. It is alleged that these nine had already received $5,000 each from T. V. Halsey, general agent of the Pacific Company, upon the understanding that they would vote against the Home franchise. Halsay himself is indicted fourteen times, for paying $5,000 apiece to thirteen supervisors and $10,000 to Gallagher. He is now in Manila, installing a telephone system, and has been arrested there. He is a brother-in-law of Louis Glass, president of the Philippine Telephone Company, and of the late John I. Sabin, who was at the head of the telephone service in Chicago. Glass (formerly vice-president of the Pacific Company), was indicted nine times on the 23d. In eighteen indictments Ruef is charged with bribing as many supervisors with $750 apiece to vote for making the price of gas 85 cents instead of 75 cents; in eighteen more the charges are that he paid $500 apiece to eighteen supervisors for the Fight Trust franchise. Four men, Graney, Britt, Coffroth and Levy, paid Ruef $20,000 for this privilege; the supervisors got not quite half of it. Levy has confessed. Among the indictments made known on the 23d are thirteen against Abraham K. Detwiler, a capitalist, of Toledo, Ohio, who is accused of paying $59,500 in bribes to thirteen supervisors, in the interest of the Home Telephone Company. Ruef's bail was fixed at $650,000.

Mr. Heney's Purpose

Prosecutor Heney says this is only a beginning. It is reported that no supervisor will be indicted, nor is it probable that any of them will be removed from office. There is no provision in the local laws for removal, unless a supervisor is convicted. Prosecution to conviction now would compel Mr. Heney to disclose and use against the supervisors the evidence with which he hopes to convict and punish the responsible officers of public service corporations who gave the bribes or authorized the use of money for corrupt purposes. Evidence connecting these officers with the payments made to Ruef is not yet sufficient. Some expect that Ruef by a confession will supply what is lacking. He is closely guarded in a hotel by State Senator Biggy (commissioned by the court to perform this duty) and two armed men. Neither the sheriff nor the police are fully trusted. Schmitz is closely watched. Nothing is said about evidence against him. In a long statement, Supervisor Lonergan gives his experience. He never solicited a bribe, he says, but took what was offered. Gallagher handled the bribe money, except in the case of the Pacific Telephone Company. After Halsey had made direct payments of $5,000 apiece to him and others for that company, and had promised $2,500 more, Lonergan was warned by Gallagher that "the administration" was on the side of the Home company. "So when the time came we all voted for the Home franchise." A few days later he received $3,500 from Gallagher. "I wish," says Lonergan, "I had taken the advice of my broken-hearted wife and remained on the driver's seat of Foley's bakery wagon."

Railway Questions

Only one of the four railroad presidents whose names were given to Mr. Roosevelt by Mr. Morgan has called at the White House. This one is Mr. Mellen, who had a brief interview with the President on the 19th. A report that the subject of the President's conversation with Governor Deneen was the promotion of Secretary Taft's candidacy for the Presidential nomination has been denied, apparently by authority. There are indications that the conversation related to the issues of Alton securities and to State legislation on railway questions. Senator Cullom called upon the President last week and, upon leaving the White House, said to the newspaper correspondents: "I told Mr. Roosevelt that if I could have my way, and if there was law for it, I would send Harriman to the penitentiary for his work in the Alton deal, and keep him there long enough to make him pay the full penalty for looting the road and bringing about conditions for which the

bondholders will have to suffer." President Ripley, of the Atchison road, says that Mr. Roosevelt's intentions are always good, but that he "must be held responsible for starting a brush fire which has now apparently become a conflagration." Government ownership, he adds, "would mean the downfall of the Republic." A rambling interview with John D. Rockefeller has been published. He says in it that the railroads are "vastly overcapitalized," but that it is now practically impossible to reduce the capitalization; that Federal control would be better for the roads than State control. Replying to a question for his opinion concerning the general financial condition of the country, he says: "I do not like the outlook." Conditions are good on the surface, he adds, but there is "an undercurrent that doesn't look good." Commenting upon this, Mr. Harriman says the roads are not overcapitalized. President Hadley, of Yale, remarked last week in a public address that if a fair valuation of the roads should be made "we should probably find that they are not paying more than 4½ per cent." In an address to students of the Wharton School of Finance at the University of Pennsylvania, last week, Stuyvesant Fish, formerly president of the Illinois Central, defended Mr. Roosevelt. While he still believes that the Rate bill was unconstitutional and economically unsound, he could not blame the President for the recent fall in stock exchange prices.

"The fact is that he saw, as others had seen, that there was something wrong in the railroad situation, and, feeling it to be his duty, ordered an investigation which has brought to light conditions and practises which cannot be characterized without language that might be called vituperative. . . . It was to those conditions and practises that the recent catastrophe on the Stock Exchange was due, and not at all to any act or omission on the part of the President or the Interstate Commerce Commission. These gentlemen simply acted in the line of their duty. Their action was like that of a prosecuting officer in bringing out the details of a robbery or a murder."

Thomas F. Ryan says the railroads are really owned by the people, and not by Wall Street brokers. "They should be taken out of Wall Street, and the stock quotation tickers should be taken out of the railroad offices." Railroad officers and practical railroad men who are charged with the responsibility of operating the roads, he adds, should be in absolute control, and should welcome every opportunity to confer with Mr. Roosevelt. Ex-President Cleveland says we shall be ashamed by and by of the popular outcry against railroads, which "have had a hard time lately," with "every man's hand against them." Remarking that he appreciates "the justice which lies beneath the present clamor against corporations," he believes that this clamor "as a frenzy will pass." He urges Democrats "to lose no time in bringing to the front the issue of tariff reform and in focusing the attention of the country upon it."

Pennsylvania's New Capitol

An investigation now in progress at Harrisburg, Pa., concerning the cost of furnishing the new capitol has brought out interesting facts in support of the charges made by Mr. Berry (now State Treasurer) and others in recent political campaigns. The cost of the building was about $4,000,000, and $9,000,000 more was spent for furniture, decorations, etc. Nearly all of the work under the head of furnishing was given to one contractor, John H. Sanderson, to whom something more than $5,000,000 has already been paid. Altho the advertisements authorized by the Board of Public Buildings were so worded as to lead bidders to believe that separate bids for the several classes of supplies or kinds of work were invited, it now appears that the Board had adopted a resolution, proposed by Governor Pennypacker, preventing the acceptance of any bid which did not cover all that was to be done or furnished. The testimony of unsuccessful bidders indicates that this restriction was known to none of them, but that it was known to Mr. Sanderson. The latter's profits were extraordinary. This has been shown by comparing the prices he paid to sub-contractors with those which he received from the State. For example, he paid $2,060 for two rostrums, and received for them $90,748. For furnishing four rooms he paid $8,101 and received $76,312. An unsuccessful bidder had offered to paint a certain number of square feet of surface for $164,473; for this work Sanderson received $789,743.

The Panama Canal Secretary Taft started on the 23d for Panama, Cuba and Porto Rico, accompanied by Senator Kittredge, Representatives Burton and De Armond, and three civil engineers—Alfred Noble, of New York, formerly a member of Canal Commissions; Frederick P. Stearns, of Boston, and John Ripley Freeman, of Providence. These engineers were invited by the Secretary to make a thoro inspection of the borings for the foundations of the proposed dam at Gatun. This structure is conceded to be the key to the lock plan, and upon their report may depend the final decision as to the type of the canal. Secretary Taft sails from Charleston on the "Mayflower" and will be absent from Washington for about a month.——Leroy Park, an agent of the War Department, has been in Europe for several months soliciting foreign labor for the canal. Since October last he has forwarded to the Isthmus 4,500 men, nearly all of them Spaniards or Italians. They agree to pay for their transportation hereafter out of their wages, at the rate of $4 a month. Employment at 20 cents an hour is guaranteed, with free lodgings and medical attendance, and three meals a day at 20 cents each. Park has encountered much opposition from the Spanish and Italian Governments. —— The forty-six members of Congress who went to the Isthmus returned last week. They spent four days in inspecting the canal work and were very favorably impressed. Some of them think the cost of the canal has been underestimated. All commend the administration of Chief Engineer Stevens, speak of his popularity on the Isthmus, and regret that he has resigned.

The War in Central America Nicaragua won a series of victories last week in her war with Honduras. Trujillo, the chief port of Honduras, was captured on the 18th by 1,500 men who had been landed from Nicaragua's three gunboats. The port of Ceiba was taken a day or two later, and before the end of the week the entire northern coast of Honduras was in the hands of the enemy. Honduras also lost her naval vessel, the "Olympia," a converted fruit steamship, carrying four rapid-fire guns and having 2,000 rifles on board. American marines were landed at Trujillo and Ceiba to protect American property. While these ports were surrendering to Nicaragua's little navy, Honduras was hard pressed by Zelaya's army. On the 10th, Salvador had sent 3,500 men to the aid of Honduras, but these reinforcements were of little value. On the 18th, at the end of a three days' battle near Namisiquo, the united armies of Honduras and Salvador (led by General Presa of Salvador) were routed. Four days later, the allied forces suffered another defeat, near Choluteca. Among the prisoners taken were the Honduran Minister of War and General Lee Christmas, an American soldier of fortune from Tennessee. It was expected that Tegucigalpa, the capital of Honduras, would soon be captured. Choluteca was taken on the 24th, and the flight of President Bonilla was reported. At the end of last week, the governments of the United States and Mexico were preparing to make another effort for a restoration of peace. Their first offer of good offices had been rejected; it was thought at Washington that if the second one should not be accepted, joint intervention would follow. Our Government has two warships on one coast and two on the other. It appears that Minister Merry did have a quarrel with President Zelaya. Having obtained what seemed to be conclusive evidence that his cable messages had been tampered with by Zelaya, the American Minister closed his legation at Managua and started for Costa Rica. While he was waiting at Corinto, the steamship "Barracouta" arrived at that port from Panama. The Nicaraguan Minister of War demanded all her papers and attempted to examine her cargo. Mr. Merry went on board, raised the flag of his legation, and prepared to defend the ship. He informed the Nicaraguan officers that the ship was the American legation. No search was made.

French Legislation A bill has been introduced into the Chamber of Deputies for the reform of the parliamentary electoral system. It has been drawn up by the universal suffrage committee of the Chamber and provides for proportional representation. Each voter is

to have as many votes as there are deputies to be elected in his district, and he may either distribute them among the candidates or cast them all for one. The object of the arrangement is to secure proper representation of minorities in the national legislative body. In case of the resignation of death of a deputy it is provided that the vacancies shall be filled by the candidate receiving the next highest number of votes. The deputies are to hold office for six years instead of four, and the number is to be reduced from 591 to 490.——The income tax bill is being amended so much that it is doubtful whether it will pass. In order to prevent driving away wealthy foreigners desiring to reside in Paris, a clause has been added exempting from the income tax aliens, who do not exercise any profession or trade, staying in France less than ten months. After that time they will pay 10 per cent. of the rent of the house in which they live.——The Committee on Hygiene has reported in favor of a law totally prohibiting the distillation, importation, traffic and sale of absinthe at the end of two years.——The Senate is considering a measure for the reduction of the death rate of infants by the protection of mothers during the period of child-bearing. It is intended to prohibit women from laboring for the period before and after child-birth, and to pay working women a franc a day during such time. The Minister of Finance, Caillaux, approves the bill theoretically, but points out that it is hardly practicable as it means an addition of some $9,000,000 to the expenses of the Government.——Charges were brought by the Socialist members against the Government on account of atrocities and tortures inflicted upon the soldiers serving in the disciplinary battalions in Africa. Minister of War Picquart declared the reports much exaggerated, altho he admitted that abuses of discipline had been committed.——The Chamber of Deputies has voted the honor of a national funeral to M. Berthelot, who was the most distinguished of French chemists, and appropriated $4,000 for that purpose. The clerical Deputies voted against the honor because Berthelot was an outspoken free thinker.——The Chamber of Deputies approved of a proposal presented by the Socialists calling for the appointment of a commission to examine and make public the contents of the documents seized by the Papal Nunciature. The committee is composed of twenty-two members, including M. Jaurès and M. Pelletan. The Vatican protests against this as another violation of international law, but disclaims all responsibility for the private diary of Mgr. Montagnini, which is the most sensational of the papers on account of the light it throws on the intrigues of French politics and faults in the character of certain ecclesiastics.

Stolypin's Proposals

The program of legislation prepared by the Government was laid before the Duma, assembled in the Hall of the Nobility, by Premier Stolypin. The ministerial program provided for a large number of reform measures which, if carried out, would be a very great step in advance for Russia, but the lack of confidence on the part of the Duma in a Ministry over which the representatives of the people have no control, prevented the proposed reforms from being received with approval. The Premier began by stating that Russia must be transformed into a constitutional state. Legal measures must be adopted to define and determine the rights of the State and the rights of persons, and to abolish contradictions between the old and the new laws and the altogether arbitrary interpretation put upon them by private persons and by officers. The laws which he was about to lay before the Duma were of urgent importance, in establishing the new régime in Russia. The Government had already assisted in alleviating the conditions of the peasants by promulgating laws handing over crown lands and imperial estates to the peasants and freeing them from their attachment to their native communes. In carrying out the principle of liberty of conscience laid down in the Czar's manifesto of October 30th, 1905, it must be firmly recognized that Russia was a Christian State in which the Orthodox religion was privileged. The Russian nation had always been inspired by the Orthodox religion, which was the glory and power of Russia. Nevertheless, the

rights of the Orthodox Church must not infringe on the rights of other religions, and the Government was bringing forward a series of laws dealing with proselytism, the holding of services, etc. To secure inviolability of person it had been decided to do away with the system of exile by administrative process. The three degrees of "exceptional security" would be abolished and a single form of martial law substituted. Except where martial law was in force only the proper judicial authorities would have the right to interfere with personal freedom. Criminal and civil procedure would be reformed, beginning with the election of justices of the peace by the local population. Full liberty of action for employers and workmen would be granted, including the right of economic strikes. Bills would be introduced for the insurance of workingmen, for old age and medical relief, prohibiting night work and underground work for women and children, and establishing shorter hours for all workmen. Local self-government would be increased by the establishment of the volost as the smallest association and administrative unit of self-government without class distinction of any sort. Education for the people was to be free, and later made compulsory. The Trans-Siberian Railroad would be completed to the Pacific thru Russian territory. At the conclusion of the Premier's speech, Prince Zeretelli, member from the Caucasus, spoke for the Social Democrats and declared that the first thing to be done was the overthrow of the present Government and the substitution of one by the will of the people. "Carthage must be destroyed." The ensuing discussion was confined to the extreme Left and the Right. The Constitutional Democrats took no part in it and finally voted to proceed to the order of the day. The power of the moderate party in the new Duma, of which the Constitutional Democrats form the main element, was shown on the following day when the question of famine relief was taken up. The Socialists proposed that a commission be appointed by the Duma to act independently of the Government in the distribution of food and to investigate the whole system of famine relief for the last two years and to prosecute the officials who had been guilty of graft in connection with the purchase of grain for the famine districts. This resolution was voted down by 325 to 149, and instead of it was passed the resolution favored by the Constitutional Democrats, that the Duma appoint a commission of thirty-three to supervise the administration of the famine relief fund. This was accepted by Premier Stolypin in behalf of the Government.

Moroccan Difficulties

The delay in carrying out the program of the Algeciras Convention prevents any improvement in the condition of this unhappy country. The Maghzen are spending recklessly the money which they borrowed, and have applied for another loan of $2,000,000 from the State Bank established by the representatives of the Powers. Yet they have obstructed all efforts to put into effect the reforms recommended by the Powers, such as policing of the ports, opening of the country to commerce, and permitting Europeans to purchase land. Col. Armin Muller, of the Swiss army, who was designated as the chief of the Moroccan police, has been accepted by the Sultan and has arrived at Tangier, but he has not yet been able to organize his force. The Sultan's troops, camped near Tangier, have not been paid for months and complain that they are on the verge of starvation. They failed entirely in their effort to capture Raisuli, who is now reported to have left with fifty horsemen and a camel train to join the Pretender, who is fighting for the Moroccan throne. Raisuli, after his expulsion from his mountain fastness, took refuge with the Ben-Iarous tribesmen. The Sultan's troops pursued and attacked the tribe, burning seven villages, killing twenty men, and taking a number of prisoners, but Raisuli slipped thru their fingers, altho they supposed that they had closed every path of retreat. A serious affair, which is likely to bring matters to a head, occurred in the city of Morocco, or Marakesh. Here Dr. Mauchamp, the French Consul and member of the French Geodetic Mission, was assassinated by a native mob, who stabbed and stoned him

to death. The signal posts of the Geodetic Survey, which had been placed upon the roof of a house, had aroused their suspicion and fanaticism. The other European houses in the capital were also attacked. The British Consulate was besieged, but repelled the mob, killing two of them. The French cruisers, "Jeanne d'Arc" and "Lalande," have been ordered to proceed to Tangier, and the French Government will probably now change its policy from "pacific penetration" to active intervention.

The Transvaal Parliament

The first Parliament of the Transvaal under the new constitution was held at Pretoria March 21st. A large crowd assembled in Government Square, where two regiments of British Infantry were drawn up as honorary escort of the High Commissioner for South Africa, Earl Selborne. The members of the Lower House took the oath on the balcony overlooking the square from which President Kruger used to deliver his biblical addresses. The House organized by the election of General Beyers as Speaker, on nomination of the Premier, General Botha. Considering the fact that the members of the assembly were so recently at war with each other, the proceedings were remarkably harmonious. The only difficulty occurred on the language question, the Afrikanders persisting in the use of Dutch and shouting "Speak Dutch" to any officer or member who addressed the House in English. Lord Selborne, in his speech to Parliament, expressed the hope that the institution of self-government in the Transvaal would remove the causes of misunderstanding and disunion and result in permanent peace and progress. The election, he said, had been characterized by a remarkable absence of racial bitterness and this was a happy augury for the union of the two white races. He announced that the employment of Chinese in the mines would cease at the earliest possible moment, and that the Chinese already employed would return at the end of their indentures, unless the Government were convinced that there was no effective substitute, either in the form of other unskilled labor or improved mechanical appliances. The Government had taken steps to increase the supply of natives and to give the mining industry every assistance. The first act of the Lower House was the introduction and immediate passage of the Asiatic ordinance, which excludes Japanese and other Asiatics who have been emigrating to South Africa in increasing numbers. Small white traders in the Transvaal are being crowded out by natives of India. On the following day the Asiatic ordinance was passed by the Upper House.

Agrarian Riots in Rumania

The peasants of Moldavia, the northern province of Rumania, have risen against the landlords and are attacking the towns and ravaging the estates. The riots, like those of Kishineff and other towns in Bessarabia, on the Russian side of the Pruth River, are anti-Semitic, and to the religious and racial antagonism is added a conflict of economic interests. The disturbed district is almost exclusively agricultural, and the land has been gradually acquired by syndicates, whose only object is to squeeze as much rent as possible out of the peasants. It is said that half the cultivable land of Moldavia is owned or leased by a trust of three Jewish families, Fischer, Costenia and Juster. The absentee landlords take no interest in their estates, except as a source of revenue, and they put them in charge of rack-renters of their own race. The present riots were concerted and well planned. Organized mobs of thousands of peasants marched simultaneously against the towns, applied to the mayors for permission to sack the Jewish quarter, and, whether this was given or not, proceeded to do it. In some places they had official approval or connivance, in others the local authorities were powerless to prevent the atrocities. The only town making effective resistance was Jassy, which was with difficulty defended by 8,000 troops for six days against a still greater number of peasants. At Vaslui, Dorohoi and Botuchany and their environs the mob had full sway. Jewish merchants and managers were tortured, their wives and daughters outraged, and their children tied in sacks and thrown into the rivers. Some 400 estates were pillaged and over 10,000 homeless Jews fled across the bor-

der into Austria. The Rumanian troops have not been able to cope with the mob, and in some cases they seemed more disposed to fraternize with the peasants than to protect the Jews. One troop going to the disturbed district stopped their train to wreck a synagog. The reserves, amounting to about 30,000 men, have been called out, but the disorder seems likely to spread thruout Moldavia and into Wallachia. Austrian troops are massed on the frontier to prevent a similar outbreak in that country. The students and some of the professors of the University of Jassy sympathize with the peasants and have assisted in the circulation of incendiary literature. A delegation of the students went to Bucharest to urge the cause of the peasants, but King Charles refused to receive them. Some of the circulars distributed among the people urging them to drive all the Jews out of the country purport to be signed by Queen Elizabeth, better known to us under her pen name of Carmen Sylva. Russian agents from the eastern border are said to have been active in exciting the pogroms. Premier Cantacuzene announced to the Chamber of Deputies that the Government would do everything in its power to put down the anarchy in Moldavia, but he appealed to all political parties to remove the cause by taking "severe legal measures against the agricultural trusts, which monopolize to an enormous extent the land, grinding the peasants until they are reduced to desperation." The laws proposed restrict the power of large tenants and absentee farmers. The Conservative Ministry has resigned and ex-Premier Sturdza has formed a Liberal Cabinet.

China

The Pekin correspondent of the London *Times* has recently passed thru the heart of China from the capital to Ha-noi, the seat of the French Government in Tongking. He reports a marvelous change in the character and temper of the Chinese people in the last few years. Even in the provinces which were formerly hostile to foreigners he was treated with uniform friendliness. Half of the journey from north to south he was able to make by the Pekin-Hankau railroad, now owned and operated by the Chinese. In all the important towns and in some of the villages he found schools opened where foreign learning was being taught after a fashion. The demand for teachers of English is far beyond the supply. In Kweilin there is a complete educational system from the preparatory to the high school. In one of the grades a Frenchman was teaching the Chinese boys to sing English songs to the accompaniment of a Japanese harmonium. The maps, globes and anatomical charts were prepared in Japan for the Chinese schools. Military drill and physical exercises are being taught in all these schools. The correspondent reports that no attention is paid in the interior to the edicts prohibiting the manufacture, sale and use of opium. Reports from Pekin do not give so roseate a view of the reform movement in China. The Government, which a few months ago was encouraging it, is now decidedly reactionary. Viceroy Yaun Shih-kai has appealed in vain to the throne for financial aid for his schools, which he says must be closed unless relief comes soon. An imperial edict has been issued ordering that Chinese learning shall be given the leading place in the curriculum of the schools; that foreign learning shall be regarded merely as an adjunct; that the principles of morality as laid down by Confucius shall be inculcated; that all honor shall be paid to the Confucian philosophy; and that the selection of instructors for the memorial school in Chifu shall be made a matter of consultation with Chang Chih-tung, a reactionary viceroy. Tong Shao-yi, a progressive leader educated in America, has been dismissed from his position as vice-president of the Board of Foreign Affairs and made under secretary of the board.——It is estimated that 20,000 persons have perished of starvation in the famine districts and ten times as many may yet starve. The British and American donations to the relief fund now amount to $325,000.——The last battalion of Russian troops was withdrawn from Harbin this week. The Japanese are also evacuating Manchuria. Both nations will leave sufficient soldiers to guard their respective sections of the Manchurian railway.

EDWARD HENRY HARRIMAN.
From a painting by Otto von Krumhaar.

The Railroads and the People

BY EDWARD HENRY HARRIMAN

[The present article is based on an interview with Mr. Harriman, published in the New York *Times*, and has been revised and corrected by him in the present form. It will be remembered that Mr. Harriman lately had an interview with the President, in which he explained his desire that there should be co-operation and not antagonism between the railroads and the general Government, and that the public should be fully informed as to the methods employed in conducting the business of the railroads.—EDITOR.]

UNLESS there can be a franker understanding between the people and those who conduct the business of the railroads we might just as well stop trying to do our share in the development of the country. What I said in Washington I say now, that there has got to be co-operation on the part of the railroads on the one hand, and the public and the Government on the other. We have tried other methods; we have left it to our lawyers to take care of legis-

lation by whatever means might be most effective, and to our subordinates to explain things to the general public. It won't do. We have produced a flood of legislation thruout the country, some of it of doubtful purpose, and some the result of misdirected zeal inspired by the National Administration; and if we are ever to extricate the railroads we have got to come out in the open and tell the people the railroads' side of the matter.

Take the situation where this Interstate Commerce Commission enquiry started. There were pending arrangements between several large corporations and foreign capitalists running into the tens of millions. These arrangements were on very favorable terms. As soon as the foreigners heard that the Interstate Commerce Commission was going after the Union Pacific they came to the conclusion that American corporations in general were in a pretty bad way and the negotiations were broken off.

Now if those arrangements had been completed it would have established a standard of credit for all good American enterprises that wanted to raise funds abroad. All that was stopped, for the time being, by the timidity of foreign capital produced by the institution of the enquiry.

If we are unable to meet the further development of the country, railroads become fetters for the country's business interests. We can see the causes of this situation if we go back fifteen or twenty years in railroad development.

Back of 1893 for a decade there had been a period of rapid construction of railroads, the great period of railroad expansion as the country began to recover from the effects of the Civil War. The railroads in that era unquestionably built beyond the ability of the country to support them. When a reverse in business came in the early nineties, as such things do come from time to time, here was all this railroad construction for which there was no corresponding demand. The receivership period was the logical result.

Then we had the period of receiverships and reorganizations which was practically contemporaneous with the recovery of the country from the depression of 1893. But in that period practically nothing was done by the railroads to anticipate the future development of the country. They had all they could do holding their own and making two ends meet after what had gone before. Now suddenly the country emerges from the years of business depression into six or eight years of the greatest development it has ever known. The railroads have been obliged to crowd into this period all the new work of providing new facilities that should have been distributed thru as many years more preceding. And at the same time they have had to anticipate, so far as possible, future development of the country.

Now how do we find the railroads prepared to meet this national development? The present facilities are inadequate to transport with economy either to the shipper or the railroads, the goods which are to be carried. This is the all-important point for co-operation between the railroads and the public; for the failure on the part of the shipper to handle the business economically has generally been charged up against the railroads, while the railroads' inability to handle it economically has meant less effective service and a tendency to higher rates.

Now, take an example. The other week I went up to Groton, Mass., where my boy is going to school. I lived in my car while I was there, and I couldn't help noticing conditions in the station yard. There were three coal cars and one box car on a siding, and unloading the three coal cars were two single horse carts. At one of the cars they were actually screening the coal as they unloaded it.

Now, right on the other side of those cars there was a coal shed. If that coal had been unloaded into the shed instead of into the carts, the cars might have been moved out on the road again to carry somebody else's coal. But, no, they had to unload it, a cart at a time, and to tie up three cars for about three times as long as was necessary. On that basis the service of two cars was lost for the entire time that the three cars were allowed to remain at Groton.

If you multiply that sort of thing by the number of sidings in all the towns and villages of the country you will see what I mean by saying that the facilities provided by the railroads have over-

lapped the facilities provided by the shippers. Yet it is put up to the railroads to increase their facilities so as to eliminate the congestion. That is what we are trying to do, but you will not get any correct conception of the magnitude of the task until you consider just for a little while the problem of terminal facilities. That is where we have got to have the co-operation of the public more than anywhere else, for we have reached the limit of providing terminal facilities as the present development goes.

The ability of the railroads to render service is absolutely dependent upon the matter of terminal facilities. And those are conditioned, not upon the length of the yards, but the number of tracks and the capacity of the cars.

For instance, if you have a hundred cars on a limited number of tracks and you want to pick out any twenty cars to move out somewhere, it is necessary, in practice, to move virtually the entire hundred. But if you have the total amount of freight distributed among fewer cars of larger capacity, or have the hundred cars distributed over a greater number of tracks, there is a proportionate reduction of the number of cars that will have to be moved in order to pick out the twenty.

You come now against the flat limitations in this matter of terminal facilities. There is only a given amount of space available on all the island of Manhattan that you can cover with tracks, and we have practically reached the limit of carloads on the existing gauge.

It is a matter of practical experience that if we could go on increasing the width of the cars up to a standard that would be permissible on a six-foot gauge, or even a five-foot gauge, we would be able to get a great deal more car capacity for a given increase in dead weight.

Furthermore, we would gain in the loading and unloading. If, for instance, by increased car capacity, you put into twenty cars freight which had previously taken up thirty cars, you require less terminal trackage for the handling of the freight, you are able to get it on and off with greater speed and you have the other ten cars out on the line earning something in the meantime. But right here we come up against the matter of motive power, and in that we have reached the limit of development under steam, so long as the present gauge is employed.

You will see why this is when you remember that there are three ways in which an engine can grow to get more tractive power. It must either be lengthened, be broadened, or be made higher. And in all three directions we have made our engines grow as far as they can on the present standard gauge of four feet eight. We have already increased the length, width and hight of our locomotives to their utmost limit. If we increase our car capacity we increase the unproductive dead weight that is to be drawn disproportionately to the increase of the load, and in so doing we are making demands upon tractive power that has already reached the limit of its development under present conditions. The obvious relief then would be by widening the gauge to six feet, and I am not sure that the railroads will not come to that in the end.

If the country after the Civil War had adopted the six-foot gauge that some of the railroads in the South then employed, or even a five-foot gauge, we would be in much better shape today, for we could increase the hight and breadth of our locomotives to get greater tractive power per engine, and could increase the capacity of our cars without disproportionately increasing the dead weight that has to be drawn in moving a given trainload.

But perhaps it is chimerical to think now of rebuilding the railroads of the entire country and of replacing the entire railroad equipment. If so, what is the next best thing?

Obviously electricity. And I believe that the railroads will have to come to that, not only for the purpose of getting a larger unit of motive power and of distributing it over the trainload, but on account of the fuel proposition.

That brings up another phase of existing conditions. We have to use up fuel to carry our fuel, and there are certain limitations along this line, just as much as there are in the matter of car capacity or of motive power, particularly when you consider the distribution of the

coal-producing regions with respect to the major avenues of traffic.

The great saving resulting from the use of electricity is apparent, quite aside from the matter of increasing the tractive power and the trainload, but there is this additional consideration, that when you are operating by electricity you are not losing money when you stop your train. That must not be lost sight of. The train makes money when it is going somewhere, when it is carrying something that somebody wants. When it stops it ceases to make money and becomes a losing proposition because it goes right on burning up coal without doing any work. Your electric train when it stops isn't using up any power, and the only fuel waste is that incidental to the maintenance of the system.

Now I have gone into these things in detail to show first, that the railroads in handling the increased volume of traffic under present conditions, or anything approximating them, must do it at an ever increasing ratio of expense that will tend some day to become prohibitive if present rates are to be maintained or fair returns realized for their shareholders; and, second, that the only relief which can be obtained thru economies of physical operation must come thru the outlay of enormous amounts of money such as would be involved in a general electrification or a change in gauge.

The railroads are now developing their facilities just as fast as conditions allow. The necessity of double-tracking the transcontinental lines is recognized universally, and we are all lengthening our sidings and our spur tracks in anticipation of the day when we can joint up the sections and have two-track roads across the country. But, do the best they will, the railroads are face to face with physical conditions, such as I have described in small part, which make it impossible to handle a larger traffic without a constantly increasing ratio of expense. It is up to them and to the people whom they serve to devise some means of more economical operation if returns are to be continued to shareholders, or rates even maintained on their present basis.

But before we go on to that, there is one other factor of increased cost that the railroads cannot escape from, whatever their economies, and that is the cost of labor, not only directly employed by them, but entering into every item of their new construction, their equipment, and their improved terminal facilities.

It is no more than a fair conclusion that the tendency of rates, for the present at least, must be to remain level, if, indeed, increases are not demanded in some quarters. Yet what is the situation all over the country? The agitation against the railroads taken up by the Legislatures in a dozen States, in pursuance of what has been believed to be the attitude of the National Administration, has produced a flood of bills for rate reductions, for restrictions of operation, and for a thousand and one other things which would make it impossible for the railroads to render service.

In all the laws propounded by the States there is the question of constitutionality. I do not propose to discuss that here, because it is for the lawyers to determine to what extent a State, by means of some specific measure, can interfere with interstate commerce which is placed under the control of the Federal Government. But one thing is obvious, and that is that the railroads have got to fight these measures as they come along and at the same time undertake to educate the public on the primary questions involved.

It is proper to consider here the general question of the distribution of traffic during the year. We have been going on the basis of moving the great crops of the country in three or four months out of the twelve, with the expectation that the railroads will have ample equipment available for handling the cotton and the corn and the wheat from October, say, until the middle of January, and then will be able to employ all this equipment during the other eight or nine months of the year, so as to make it continuously productive. I suppose that idea will never get entirely out of people's minds, but it is at least one important thing upon which there should be co-operation between the railroads and the shippers, if the roads are going to render the best service possible at the lowest rates, and have any care as well for the interests of their stockholders.

You can find examples in the coal troubles out on our lines, which have recently been reported in the newspapers. Those troubles would have been almost entirely eliminated if the users of coal had only allowed us to carry it for them in the summer season when we had an opportunity to handle it expeditiously. But no, altho we make substantial inducements to them to move their coal in the summer, they don't want to move it then. They want to wait until the busy season comes, and then want their coal in a hurry. There are thus two sides to that proposition.

This brings us to another consideration that we may well take note of before we consider what remedies can be applied if the railroads and the public will get together. The traffic men are placed between the demands of their customers on the one hand and the limitations of railroad operation on the other, and it is my opinion that most of the special concession evils that the country has seen in one form or another have arisen primarily from the desire of the traffic men to serve the people who furnish them their business.

Improper favors of various kinds come in the same class, such as allowing cars to stand an unduly long time on sidings, and the like. All these the railroads are doing their best to eliminate, and it is a sincere effort, for the railroads appreciate that economy in operation is the thing most to be striven for, and economy is not gained by giving special favors to a few at the expense of the many.

The Government might help both the railroads and the people if it would recognize by Federal statute the making of enforceable agreements between railroads for a distribution of traffic, and have such agreements binding for a given period of years.

I do not believe in pooling. The railroads never accomplished anything by it when it was legal. If you will go back over the history of all the railroad pools that were ever attempted, you will find that there was always somebody who broke the agreement and made things worse than they were before, or else that when the railroads had arranged to pool the business at a certain point some outsider came along with a proposition to build a line in there, and wanted either a part of the business or a *quid pro quo*.

The agreements that I have in mind would apply to the distribution of traffic so that it could be handled economically. As I have said in the last few days, the President started the movement for it on the part of the Government in his message last December, when he declared that railroads should be allowed to make agreements under certain conditions. I believe that he realizes the necessity for something of this kind, if the railroads are going to practise anything like the economies that the present situation demands, and it is right here that the railroads need the co-operation of the Government.

Suppose we had such a law in operation and could arrange for the distribution of the transcontinental traffic between the various lines according to the possibilities of each, then the road with a low grade and small curvature could relieve the high grade winding road of the excess of traffic that it could not carry profitably. Similarly, a distribution of classes of freight could be accomplished—which is absolutely impossible under present operating conditions—with resultant economies that are apparent when you consider what I have said about the existing state of things. Such agreements would stop railroad mergers right away.

The railroad that doesn't seek to build up the territory thru which it passes by offering good service pursues a policy that can only bring it to grief in the long run. It dries up its territory; the territory doesn't produce anything, and then there comes a day when there is nothing for the railroad to carry. It is like knocking the piers out from under a bridge, and a railroad can no more afford to disregard such natural conditions than a bridge builder.

One thing that I think ought to be done is to allow the railroads to vary their freight schedules, so that the man who wants extra quick service, which can only be rendered at an increased operating cost, could be allowed to pay for it and get it, just as a man who wants to go to Chicago in eighteen hours is allowed to pay for the extra service

he receives, and does not have to take a twenty-four hour train just because there is only one rate.

Of course, in all this there must be supervision by the Government. The railroads must recognize the necessity for that if they are going to get from the Government the relief they need. But it is only fair that they should ask that the States leave such supervision to the Federal Government and not enmesh them in a mass of conflicting legislation which tends to destroy all continuity of management and defeats every attempt at economy. Of course, we are not going to reach the millennium, whatever legislative condition we get, and whatever the degree of co-operation between the railroads and the public, but we may perhaps bring about a condition where the railroads can properly minister to the country's development of the next twenty or fifty years, which they will be shut out from doing if matters go on as they are.

This is the sort of thing that I want to have the people understand, so that they may deal intelligently with the railroad problems as they arise. It has always been my idea to have the largest possible number of people interested in the railroads which I manage. The financing of them has been done with the idea of increasing the stockholding body rather than diminishing it. I am opposed to the idea of railroad consolidation which seeks to eliminate the stockholder by making him a creditor of the road. The road needs his interest just as it needs the interest of its patrons, and in return the stockholder is entitled to a fair remuneration for the investment or risk of his money.

But a general timidity such as has been engendered by the agitation against the railroads that has been sweeping the country operates to hurt both the stockholder and the public. It makes the railroad, in the first place, pay more for the money needed for its developments than it would have to pay under ordinary conditions, putting that additional charge upon the earning capacity of the property, and in the second place it cripples the railroad in endeavoring to equip itself to render efficient service.

That is the reason why I have pointed recently to the fact that the Union Pacific system has spent $250,000,000 in improvements and extensions since 1900, has laid 7,500 miles of new track, and replaced altogether 14,000 or 15,000 miles of track.

Those things are indications of the service rendered in building up the country, and I want to do what I can to develop such a feeling of co-operation between the people and the railroads that the Union Pacific and the other systems may not be shut off from further contributing to the country's development.

NEW YORK CITY.

Easter's Redemption

BY SUSIE M BEST

LET me arise. Roll from my tomb
The sealing stone of sin;
Release my soul that hath been shut
So long therein;
Let me come from the grave without
The envelope of crippling doubt.

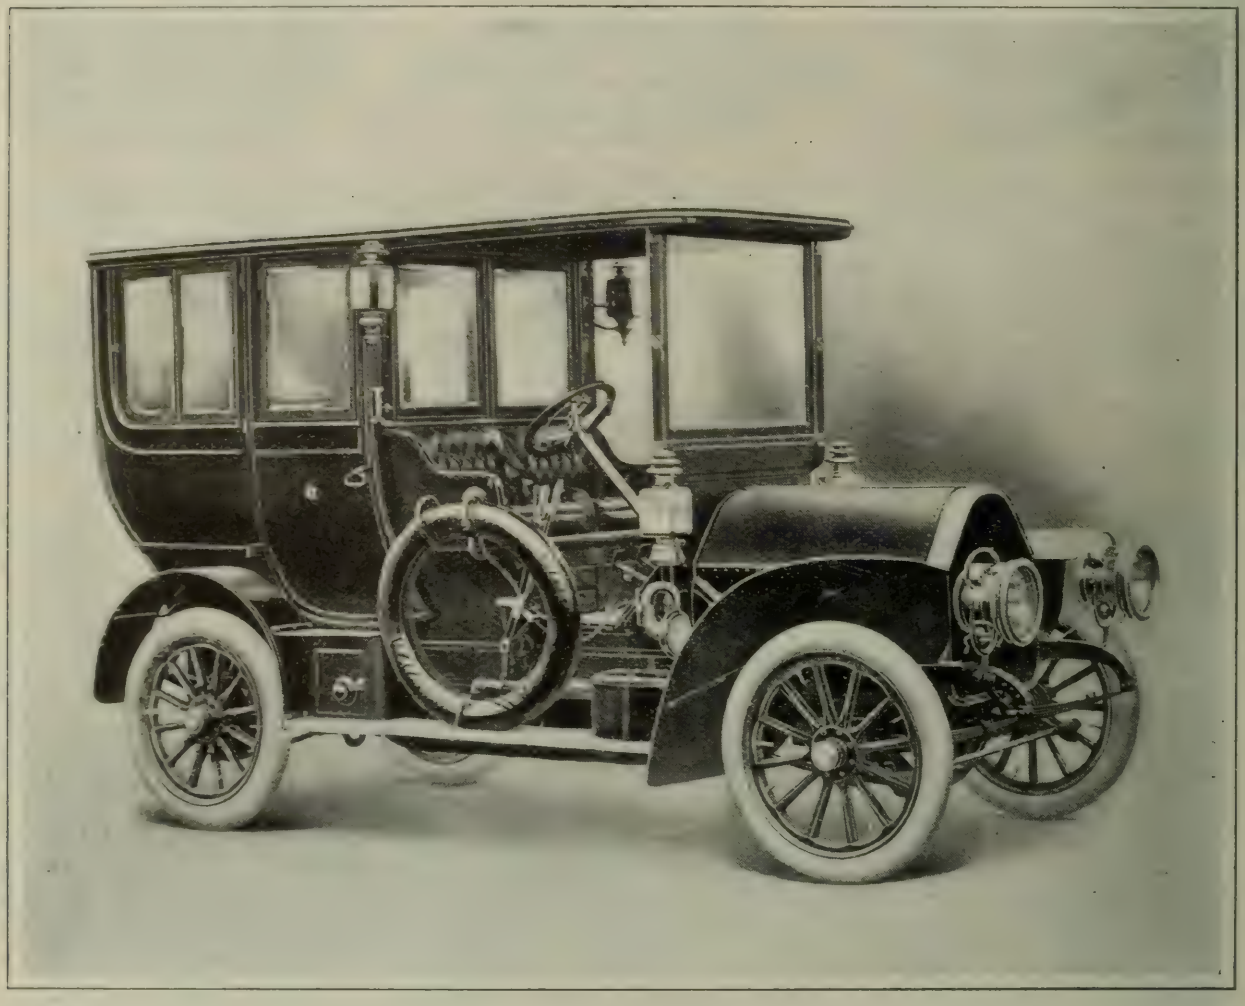
Let me arise freed from the bonds
Of foolish, fettering creeds,
Tuned to the holy truth that meets
The spirit's needs;
Roused from the torpor of a clod.
Remade into thy image, God.

CINCINNATI, OHIO.

THE NOVELTIES OF MOTORING

BY
GEORGE
ETHELBERT
WALSH

THE extreme evolution of the automobile has its amusing as well as its practical and technical side. Its employment as a baby perambulator on the streets of Paris last year was eclipsed this season by the appearance of a "dog motor car" to give the household pets of a wealthy family their daily airing. The washerwomen's motor car for collecting and distributing laundry has also become a popular feature in Paris, and over in Germany the old Yankee tin-peddler seems to have taken a new lease of life in adapting huge motor cars to the novelty of his business. The motors are old discarded stages,



FIRST AUTOMOBILE THAT WAS RUN IN NEW YORK.

The automobile is not a modern product, as most people think. One was running in the streets of New York a half century ago. It was invented by Robert Dudgeon, who built the "Steam Road Wagon," as it was called, to carry him to and from business and to convey his family to church. It was a noisy apparatus and consumed two bushels of coal and nearly a hogshead of water on each trip. Mr. Dudgeon rode in it for ten years, when the city authorities forbade his further use of it. The machine is still in existence at the inventor's Long Island home. A similar automobile, built by Mr. Dudgeon, was exhibited at the Crystal Palace, London.

fitted up to carry a miscellaneous collection of tin pans, pails and similar housesold articles which were formerly exchanged for rags in our New England States.

The development of the automobile is sometimes better understood by pictorial contrasts. Dr. Church's old London and Birmingham motor car, built at Birmingham, England, in 1833, has the appearance of a typical juggernaut car constructed for the purpose of running down ruthlessly all obstacles in its way. Its clumsy, unwieldy appearance is in sharp contrast with the automobiles of today. Somewhat more modern in external effect is the motor car "Enterprise," built at Stratford, England, in the same year by Mr. Hancock, to make trips between London and Paddington.

From these old prints of the prototypes of our modern motors the impression is gathered that in external form we have made progress no less than in the internal mechanism which drives the modern high-speed automobile. An up-to-date six-cylinder car, with 60 to 120 horse-power motor, and every convenience and luxury to make travel a pleasure, marks the extreme evolution of an industry that typifies the spirit and atmosphere of the age. Speed, luxury and safety have been the factors which have controlled the development of the industry, and these we have in abundance.

MODERN PULLMAN CAR.
Equipped with every imaginable luxury and convenience for touring.

A modern palatial Pullman motor car has all the luxuries and conveniences of a private hotel on wheels. Small fortunes are spent in the upholstering of the handsome limousine bodies of the cars, and the inside is a revelation to many. Cleverly designed pockets and doors are arranged for holding visiting cards, handkerchiefs, writing materials and clean linen. There is a complete cellaret, a writing desk that opens and closes by a spring, electric lights over-

head and foot warmers below, an ice-box with compartments for food, a motor clock, a small gasoline or electric cooking stove with chafing dish accompaniments, and complete sets of perfume bottles, silver mirrors, clothes-brushes, tooth-brushes and whisk-brooms.

Outside there are powerful search-lights to make the route of travel plain, supplementary springs to absorb any shock in traveling over rough roads, a chime horn of the calliope type which can be used to play tunes by the exhaust pressure of the engine, an electric annunciator which can be worked from the inside to give explicit directions to the driver, and a speedometer, odometer, grade indicator, barometer and thermometer. There are even accommodations for sleeping on richly upholstered couches, which slide out of the way under the seats when not in use, and toilet arrangements for long touring trips

A great many wealthy owners of motor cars have designed improved devices for making touring trips comfortable. Some of these include complete tent equipments which can be used for camping on the roadside, commissary departments which when stocked will last a week or more, special equipments to prevent accidents and to make repairing simple and easy, and duplicate sets of tires and springs for hard service. Libraries filled with choice books are furnished in some cars, and even complete shaving outfits. To prevent accident thru wilful neglect of the chauffeur, an up-to-date Pullman automobile is provided with an inside lever which the owner can manipulate to shut off the spark and stop the gasoline supply. He can bring the car to a stop at will, taking the power entirely from the driver. There are also attachments by which tires can be inflated from the inside by

UP-TO-DATE TOURING CAR.

Equipped with high power engine, odometer, speedometer, gradometer, ice-chests, and all necessities for long distance trips.

SNOW DRIFTS HAVE NO TERRORS FOR THE MODERN HIGH-POWER MOTOR CAR.

MODERN MOTOR CAR EQUIPPED WITH NON-SKIDDING TIRES.
It operates over snow and icy streets without slipping.

MR. HANCOCK'S LONDON AND PADDINGTON MOTOR CAR "ENTERPRISE."
Built at Stratford, 1833. Drawn by W. Summers. Eng'd by C. Hunt.

DR CHURCH'S LONDON AND BIRMINGHAM MOTOR CAR BUILT AT BIRMINGHAM, 1833.
John Cooke, Delin. Engraved by Josiah Allen, Birmingham.

means of the power of the engine, and the owner driving his own car does not have to descend from his seat to perform this erstwhile dirty and unpleasant work.

The cost of these luxuries range in prices from a few hundred dollars up to a thousand or two. A $3,000 car may carry with it a thousand or even two thousand dollars' worth of extra equipments. The upholstering of a special type may alone cost $500, and a glass screen, folding top and sides and powerful lights may easily cost another $500. Side baskets, hampers, ice chest and tables may run up to nearly as much. There is no limit to the most of the luxuries, one man even paying $200 for a small mahogany, pearl-inlaid table and writing desk combined.

The use of the automobile is almost as unlimited as its extreme development in special luxuries. In the West it has become an important mining factor, connecting the mines in the Arizona deserts across which man and beast cannot travel except at great risk to life and health. On the farms it serves as a means of communication between the superintendent and his different workmen, and is employed for carrying farm products to the railroad stations. In the forests it has recently been adapted for hauling logs and even as a portable sawmill. The latter work is achieved by equipping the car with a powerful motor which can be equally utilized for driving the heavy traction wheels and a complete circular saw outfit. As a feeder for railroads the gasoline motor, an extreme type of the modern traction automobile, has solved the problem of transportation in many parts of the sparsely settled regions of the country, and a number of the trunk lines are building dozens of new motor cars to make regular trips in connection with their rural service.

In the East the motor car has added innumerable pleasures to the traveling public. It has brought the city into closer touch with the suburbs, and extended the possibilities of rural life. In the cities it has crowded out several thousand horses in the past year, increasing thereby the possibilities of traffic and reducing the amount of space required for each vehicle. Delivery wagons and heavy trucks are rapidly being harnessed to motors for almost every conceivable class of work. The touring cars are becoming popular features of our annual summer vacation. Last year several thousand people took their vacations in motor cars across the country, and the past winter has witnessed a great exodus of motor car parties to the countries south of us. The so-called invasion of Europe next summer by American touring machines will further add to the pleasures of vacation motoring. Besides the cars which will enter this touring competition, several hundred others will accompany them simply as sightseers. Touring Europe in motor cars will thus soon become almost as popular as traveling from place to place in the regulation passenger trains. To make this work simpler for visitors, French and German agencies have been established for accommodating visiting Americans with reliable cars, drivers and road maps.

The development of the motor boat has been the result of the improvement in automobile manufacture, and "motoring on the water" is almost as popular as on the land. Typical automobile engines are transferred to large and small boats, and the navigation of our inland waters, bays and rivers in speedy craft is as simple and luxurious as traveling on land. The doom of the small yacht is thus sounded, and the man who could not afford a steam yacht finds today that he has a fair substitute in the motor boat.

The terrors of snow and ice have been partly banished by the automobile. With the improved non-skidding tires motoring is carried on today over snow and ice where no horse-drawn vehicle could go. The past winter has demonstrated the feasibility of traveling in automobiles over the snow. Even with the heavy drifts of snow of February traveling was not seriously interrupted. The development of the motor sleigh has also steadily advanced, and with traction wheels cutting into the snow or ice the vehicle is propelled on runners across almost any kind of a smooth surface of snow. In Canada a number of touring parties were made up to go hunting and exploring in the out of the way corners

of the wilderness. These were typical, up to date sleighing parties. The vehicles were equipped with adjustable sleigh runners and the power supplied by automobile motors. The wheels obtained their tractive power by means of sharp spikes embedded in the tires.

Motoring is a special feature in connection with the new sport of ballooning. Parties follow the balloons in their motor cars, and keep in touch with the aeronauts either by means of wireless telegraphy or by telephone lines connecting the cars and flying machines. Those who do not care to make ascensions can thus enjoy the thrills of flying thru the air by proxy.

NEW YORK CITY.

Upton Sinclair and Helicon Hall

BY MRS. L. H. HARRIS

ON the 16th of March Helicon Hall was burned, and during the six months that it was the home of Mr. Sinclair and his colony, it probably sheltered more ungrateful guests and ignoble spies than any other home in the State of New Jersey—visitors who smelled the butter and tested hospitality by the kind of food they got, college students who hired themselves as servants and thought it was funny to write about what they heard and saw for the New York papers. If the servants of private families ever discover what popular literary material they have at their command, the servant problem will become more complicated than it is and the tales told will surpass anything ever written about Helicon Hall. So many things are ridiculously true which have had no bearing upon the real significance of Mr. Sinclair's experiment. The reporters have usually missed that in their effort to make fun of the rubber trees. However, Mr. Sinclair is likely to find out how really friendly people were to him all the time. He will get many messages, and more offers of help than he can accept.

But now I come to what I have to say myself about Sinclair and his colony. I draw the curtain gently but firmly upon the scene of our first meeting. When a reviewer has said that an author has a "buzzard genius," it is none of the reader's business to know what happened when they met face to face. It is enough to say that eventually the reviewer not only withdrew the objectionable description of his genius (altho still holding that "The Jungle" is a book of horrors and indescribable odors!), and that she was for a short time in Helicon Hall as Mr. Sinclair's guest. And what follows is in the nature of suggestions for the new colony which is now being planned, based upon some impressions I received of the old colony, and in doing so I do not expect Mr. Sinclair to have the wisdom to carry them out, but at least I shall have discharged my duty.

This first colony was planned according to the ideas advanced in a very clever article on Co-operative Homes, written by the most brilliant woman economist in America and published in THE INDEPENDENT July 14th, 1904, and in doing that Mr. Sinclair unconsciously took a cruel advantage of the author.

Sinclair nearly realized the thing she advocated, and he filled it with people of much the same views and quality, but she would not live there.

But this is not censure; it is a plain statement of inevitable human nature. And few of us know how soon we would show the same kind if our theory were put to the test. Fortunately, few of us have to reckon so unexpectedly with an idealist like Sinclair, who has a pioneer zeal for creating a little new heaven and a little new earth, if he exhausts all economics and the pragmatic philosophy for the making and doing his own scriptures.

The thing that at once excited my doubts as to the success of the Helicon Hall colony was the plain inference that

everything possible was done to secure happiness, as if the people were already epicurean in their demands. The place was beautiful and clean, and possessed more "attractions" than a summer hotel that must cater to the whims of a vacation crowd. I thought of a rich old man who bought a patent bath tub, a thousand dollar bed, and hired an expensive cook. Before the end of the year he was bathing in a spring branch, sleeping on a pallet, and eating ash-cake. That is not the perversity of human nature; it is just the *nature* of human nature. And, just so, you cannot make people happy, because they do not want to be. They only *think* they want happiness, but by actual experiment they can bear less of it patiently than any other kind of experience. Sinclair ought to have known better than to arrange a system of living at Helicon Hall which offered in the most aggravating, ostentatious way the very thing people do not want. And in building the home for his new colony he should bear this in mind. I hesitate to mention the things he could do without lest I lay myself under the suspicion of making fun, first of his prosperity, and then of his misfortune. But, really, there was no need of a pipe organ. And, after all, that beautiful chimney was expensive and dangerous.

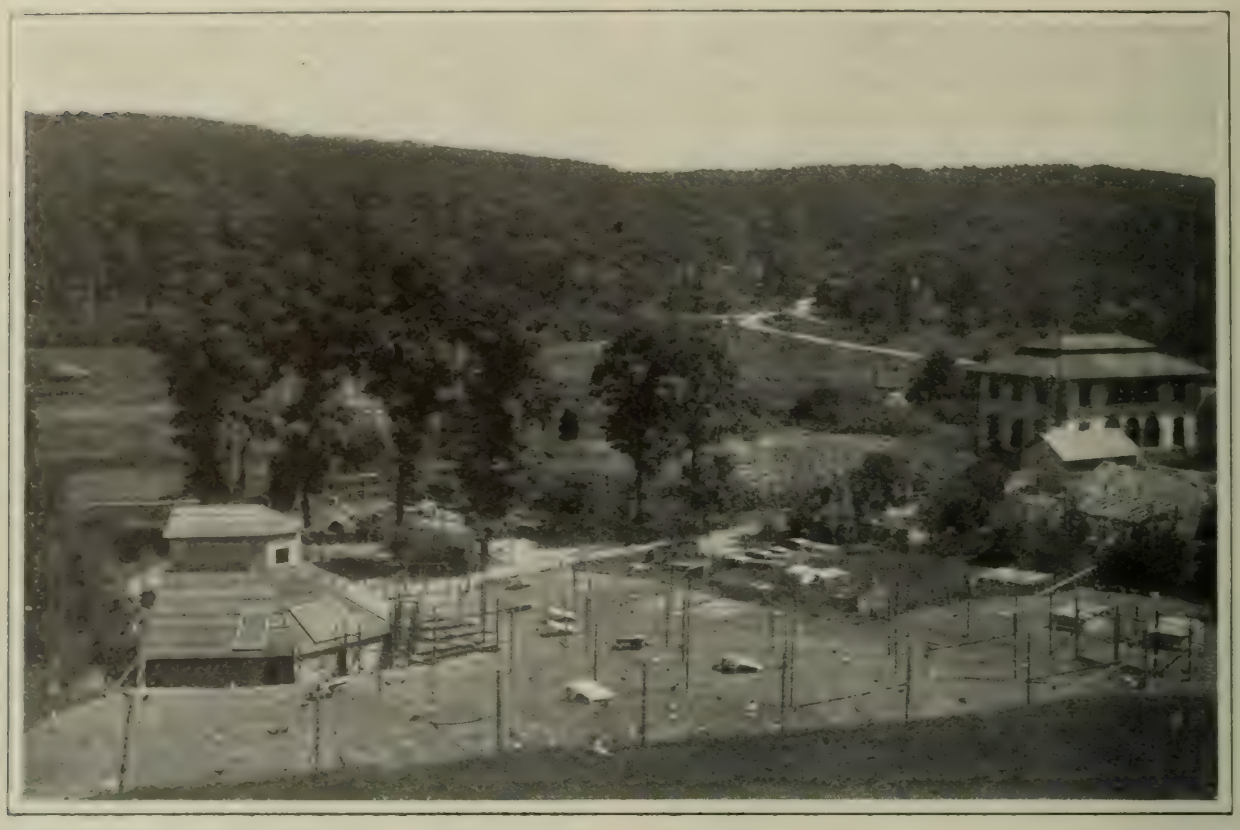
And what was the result of this strain after happiness? Every member of the colony wore an obviously redeemed look, much too bright to last. I have seen the same expression immediately after revivals, but I never knew it to wear well. It is a spiritual pose of the face. Now, the face, with all its gifts of expression and reserve, is a kind of government intended by nature to conceal the privacy of the soul. I thought Mr. Sinclair's colonists looked too much as if they were having their pictures taken to illustrate happiness. They will not wear that beatific look while they are rebuilding their homes, but they will be really happier.

Every one who knew of my visit to Helicon Hall asked me about "the fare"—that is a significant circumstance. When they get down to the living particulars, people always ask first about "the fare." It is the way they are made, in spite of all you can do. Now there were many things about the old home of the colony fashioned upon a nobler scale than "the fare," but, I repeat, it was good, well cooked and there was a plenty. It is at this point that Mr. Sinclair must be warned. If you want to excite base ingratitude in mortal man give him wholesome food three hundred and sixty-five days in the year. What he wants is occasional hardships in diet and occasional debauches in feasting. In his savage state this has always been his disposition, and civilization has only intensified it. And that is not all. A man will eat bread and bacon the year around at his own table without a murmur, who will sulk if his landlady (even if she is a co-operative landlady at that!) gives him turkey three times in succession. The angels in heaven cannot make a co-operative feeder out of such an animal. Now if Mr. Sinclair will consider what I am about to say it will save some wear and tear to his philosophy. Let the colonists live together as they did before, if they really like the herd life that much, but let each family have a little gas-stove kitchen of its own, where they can gratify that part of their nature which is not socialistic, nor co-operative, but primitively individualistic. This would not be so economical, of course; but, after all, being economical ought not to be the chief end of existence, any more than extravagance should be. The chief end of life is to do your job, and to bring up a private personal family of your own, even at the extra expense of kitchen furniture, and a greater variety of foods which may not always be digestible. I have no doubt that every colonist in Helicon Hall had a bag of things injurious to eat in his closet, because the food at the table was so healthy. There is something mean and contradictory in every man's stomach which makes him crave an occasional indigestion.

And now a word about Mr. Sinclair in his larger relation to the public. For, whatever we may think of his views, he has become the stepfather of a very large class of American citizens who are in need of chastening. He is not a man of sufficient dignity to do it without exciting humorous comments, but he has the will and the courage, two qualities often

found lacking in persons of monumental dignity. He is also entitled to the respect accorded everywhere to absolute sincerity. And he wins admiration when we consider that neither hardship nor success have made him less an idealist or covetous, for he does not know the meaning of avarice. His limitations are of another order, and so curious that they should be of special interest to people interested in psychic phenomena. He has identified himself so thoroly with characters whom he came to admire during the formative years of his life as to have acquired a second composite nature, made up almost childishly of the leading traits of his models. He had "three friends," he says, who had the "molding" of his character. These were Jesus, Hamlet and Shelley. I do not know where Shelley comes in unless it is in what somebody called Shelley's disposition to beat his "luminous wings in the void." And this is an absurd exaggeration except that Sinclair really has a splendor of the mind which so far has been darkened by a kind of incoherence or hysteria. How much his hardships had to do with this remains to be seen. His resemblance to Hamlet is easier to define, for he has actually convinced a good many people that he is a little mad. He is, however, shrewdly sane, with an unconscious trick of counterfeiting Hamlet. He has a gaze and a manner at times that make the beholder want to call Yorick. And there is an egotistical remoteness, at first puzzling. It is not a pose, but a conviction, a sedate exaltation, that puts him out of drawing with his own smaller personality, a solemn self-achieved caricature, so to speak. You will understand by remembering that Jesus is one of his friends, and he has missed his cue by falling into a histrionic imitation of the Great Galilean. It is the dramatic difference between being a prophet and a disciple.

The experiment of a co-operative home colony can only be an incident with such a man. If I were a prophet or even the son of a prophet I would predict that he will be the first to sell out his interest in that enterprise. It is impossible to say whether he is really so different from other people, but evidence goes to show that he is, and he feels it so keenly himself that he will never be satisfied until he can compare his own shadow with that of the lone palm tree in the wide desert.



NASHVILLE, TENN.

Daybreak

BY GEORGE HERBERT CLARKE

Sun! Sun! Sun! Sun!
Chorus of earth-birds, chorus of sky-birds, myriad matins begun,
Cross-tangled adventurous music, anthems of awe,
Of appeal, adoration: litanies now of law,
And now raptured singings of trust in the truth of the light,
The Lighter's proud power, and the rich-altared East, all bedight
With the glimmer, the glow, and the glory, till it mounts into flame,
And the mass-music mightily swells to the sovereign Name—
Sun!
As his garment, incredibly golden, the edge of the world has won,
And life is astir, and love is alive, and the sighing and sleeping are done,
Sun! Sun! Sun!

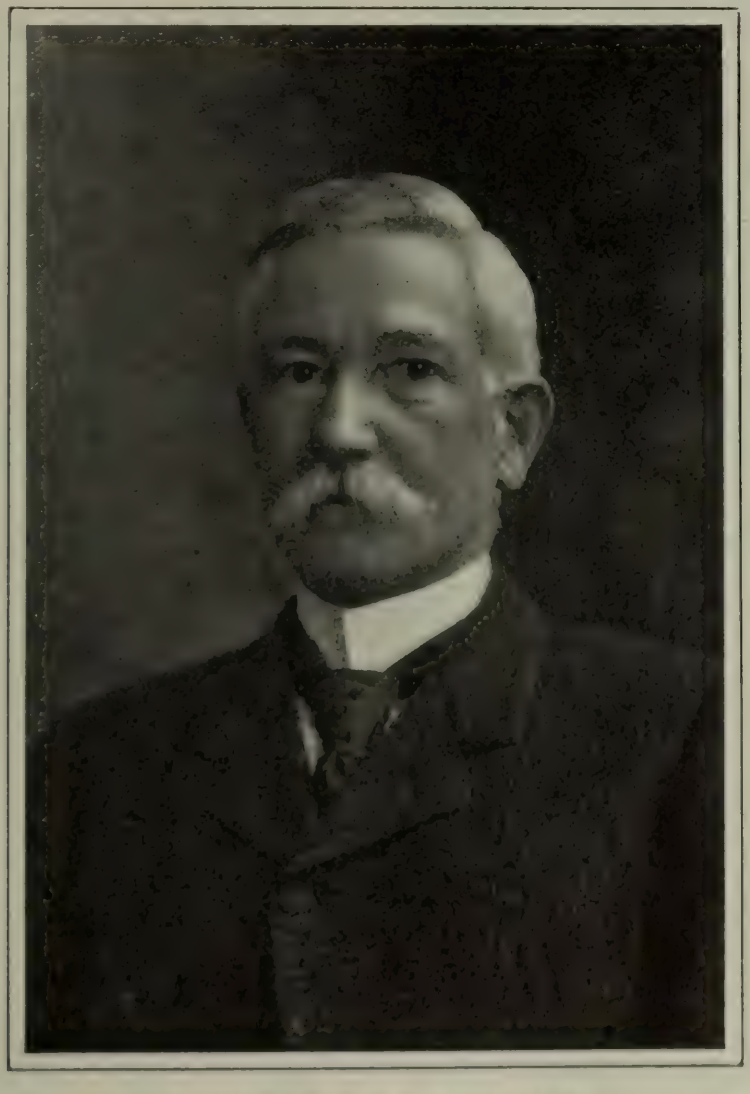
MACON, GA.

THE LABORATORY AND CHICKEN-YARD OF THE CARNEGIE STATION FOR EXPERIMENTAL EVOLUTION AT COLD SPRING HARBOR, LONG ISLAND.

The Work of the Carnegie Institution

BY R. S. WOODWARD

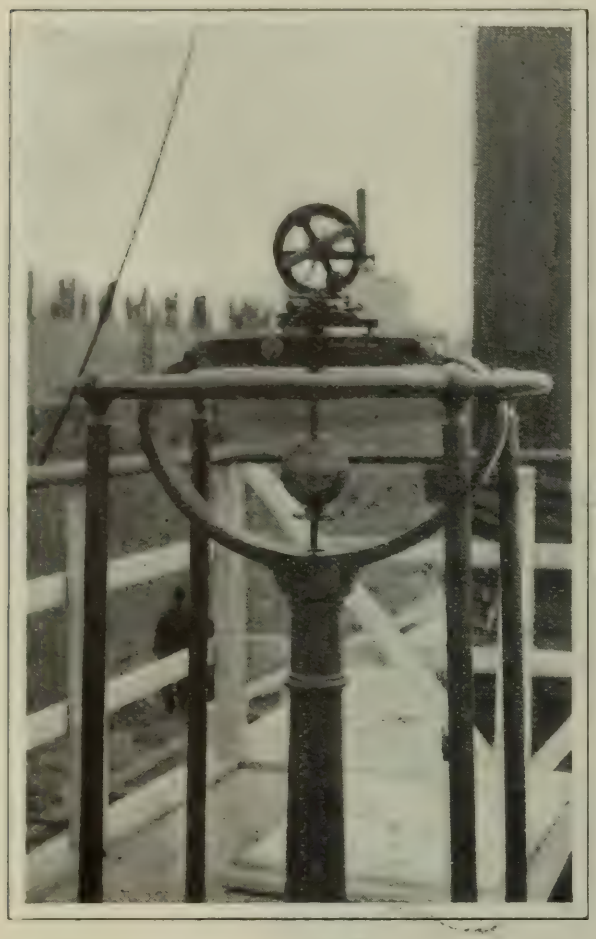
PRESIDENT OF THE CARNEGIE INSTITUTION



WHILE the Carnegie Institution has been in existence a sufficient length of time for the public to be familiar at least with the general purposes for which it was founded, it may be well to quote these paragraphs from the articles of its incorporation:

"The objects of the corporation shall be to encourage in the broadest and most liberal manner, investigation, research and discovery and the application of knowledge to the improvement of mankind, and in particular to conduct, endow and assist investigation in any department of science, literature and art, and to this end to co-operate with governments, universities, colleges, technical schools, learned societies and individuals."

Even this brief outline indicates the great possibilities and broad scope of activities in which the Institution can engage. Five years have elapsed since the date of its original organization, and with each year its work has so expanded and increased in importance that those who have kept in touch with it realize not only the wide field which it occupies, but the essential part it is already filling in human progress. When I say that at the present time the Institution is working in co-operation with about one hundred others, thru no less than four hundred individuals, a clearer idea can be gained of the extent of its interests. During the year just closed another department has been added. This new department is occupied with measurements of the positions and the motions of the so-called fixed stars, and it contemplates, as one of the essential parts of its program, the temporary establishment of an observatory in the Southern Hemisphere. Since the work of this department is chiefly devoted to meridian measurements and their applications, it may be conveniently designated as the Department of Meridian Astrometry. The work of the Desert Botanical Laboratory.



which was previously conducted by a non-resident advisory committee, has been enlarged and placed under the charge of Dr. Daniel T. MacDougal as resident director. Since the scope of the work is chiefly botanical in this department, it has been designated as the Department of Botanical Research. With these the larger projects now under way are enumerated in the following list: Botanical Research, Economics and Sociology, Experimental Evolution, Historical Research, Horticulture, Marine Biology, Meridian Astrometry, Nutrition, Solar Physics, Terrestrial Magnetism, Work in Geophysics.

It is obvious that these departments embrace so many lines of investigation and research that little more than a reference to them can be made in an article of the present character. However, a brief outline of some of their accomplishments may be included. That devoted to botanical research has had a reservation of 840 acres set apart for its use by the Territory of Arizona. On this tract, which is situated near the city of Tucson, a laboratory was erected, which, during the year has been enlarged, thus giving the investigators of desert plant life, much needed room. In addition, however, several stations have been established for studying the conditions of plant life at Alpine hights. This department has taken up the study of vegetation in the Southern basin of California, which offers especial opportunities for ascertaining the origin of the specialized flora which inhabit this and other portions of the arid regions of North America. Several years have already been given to the study with im-

portant results. The influence of altitude and climatic factors upon vegetation has been another feature of the work in the botanical department; also the move-

LLOYD-CREAK DIP CIRCLE
For measuring the dip of the magnetic needle and the strength of the earth's total magnetic force.

ments and distribution of desert vegetation, root habits, soil and air temperatures. Obviously field work has been of much importance and has been carried on extensively.

One of the most promising as well as novel and interesting departments of work started by the Institution is that devoted to experimental evolution, at Cold Spring Harbor, L. I., under the direction of Prof. Charles B. Davenport. In this department an attempt is being made to determine by direct observation and experiment the characteristic relations or laws manifested by the complicated process of evolution in plants and animals. Thus the phenomena of heredity, hybridization, mutation, etc., are here studied by substantially the same methods as those applied by the astronomer to the stars or by the chemist to inorganic matter. And just as these methods have yielded an abundant harvest of valuable results in the latter sciences, so may we confidently anticipate at least equally valuable results from the application of like methods to the problems of evolution. The intrinsic difficulties of these problems are very great, however, and they demand, therefore, an ample allowance of time as well as a peculiar degree of patience for their solution. For the work of this department especially, and for nearly all of the departmental work of the Institution in fact, a decade is the smallest convenient time unit for measuring the progress of the more important investigations now under way.

The two years of work at this station have been largely preparatory, but enough has been done to prove that the department will be one of the most important of the Institution, for such subjects as the inheritance of characteristics, the rôle of selection, origin of new characteristics and identity of evolutionary processes in plants and animals have received careful consideration and are under investigation. The expansion of the botanical work has made it necessary to rent a parcel of land situated about a mile distant from the station. The investigations upon insects have made more rapid progress as the technical difficulties of breeding them have been overcome. They have proved excellent material for experiments on the influence of changed conditions of life. Valuable results have been gained on the inheritance of different types of variations.

Experiments in the biological division have been conducted on a somewhat elaborate scale owing to increased facilities provided for it. Sixty distinct sets of experiments were made with poultry. Approximately 10,000 eggs were recorded, with few exceptions, from exactly known mother and father. The number of chicks hatched was 2,985; and more or less complete records were obtained also from about 3,000 chicks that developed, but did not hatch. All of these have been described and the records tabulated, to be used for immediate publication of results, or to be held awaiting further information. The births of the

year include six goats, six sheep and twenty cats, all of which are under observation for the purpose of obtaining data as to evolution and other phases. Experiments in the growth of hybrid vegetation have also been conducted, and a large collection of flora made for the herbarium.

The efforts of Mr. Luther Burbank in California are independent of work in progress on Long Island. A committee of the Institution has been in consultation with Mr. Burbank and plans adopted for its future. Several investigators associated with the Institution have also visited his experimental farms to observe his methods, and as a result have been greatly benefited. An idea of what he is accomplishing may be gained from the fact that at his station in the past year the work of crossing and the continual selection of promising variations has continued as before, and an unusual number of new species and varieties of wild and locally known plants have been received and are being carefully inspected for characters of value either for economic or scientific purposes. Five hundred and twenty-two native species and varieties were received from native collectors in South America, 241 from Australia and New Zealand, and nearly 200 from various other parts of the world, among them many promising new types of solanums, opuntias, native wild fruits and vegetables, locally known, and medicinal plants, trees, shrubs and flowers, nearly all from seeds, thus obviating danger of insect pests and greatly lessening the expense and giving a better opportunity for selection by having greater numbers.

Geophysical investigations have been carried on independently during the year along three distinct lines by three investigators, and many results have been announced. Among these it may suffice

Solar Observatory, Mount Wilson, Cal.

here to instance two only, namely, the volume by Professor Adams and his associate, Professor Coker, on the elastic properties of some of the principal rocks, of interest and value alike to the geologist and the engineer; and the process developed by Dr. Day for the production of the remarkable substance known as quartz glass, which promises to be of great practical value by reason of its high melting point and its low rate of expansion under temperature changes.

The novel experimental work under the direction of Dr. Day requires unusual laboratory facilities, especially in the way of high temperature and high pressure equipment and ample space therefor. To meet this requirement the trustees at their last meeting, in response to a recommendation of the executive committee, voted an appropriation of $150,000 for the purchase of a site and for the construction and equipment of a laboratory adequate to this work. Accordingly a site of five acres of land, on an isolated hill in the subdivision known as Azadia, in the District of Columbia, was purchased. Title was acquired to this site in 1906. Plans for the proposed laboratory were prepared and the contract for the construction was let in 1906. Work of construction is now moving rapidly forward, and it is expected that the laboratory will be ready for occupancy not later than July 1st, 1907.

The location of the laboratory of the Department of Marine Biology at Dry Tortugas, Fla., has required a development along somewhat different lines from those followed by other departments. Altho this location is uniquely favorable in respect to abundance of marine fauna available, it is so isolated and so subject to tropical storms that the laboratory may not be safely kept open for investigation thruout the year. Thus far, therefore, the director, Dr. Mayer, has not sought to attach to his department a permanent scientific staff. Instead of doing so he has invited, during each of the past two summer seasons, a number of trained investigators to become guests of and to pursue investigations at the laboratory. Under the administration of Dr. Mayer this tentative plan has worked so promisingly that it appears to be well worthy of consideration with a view to its application to some other departments. By a proper selection of associate investigators and by limiting eligibility to men and women of proved capacity for research, an extension of this plan to other departments may be expected not only to stimulate fruitful activity among competent investigators, but also to mitigate the difficulties which beset the administration of minor grants to miscellaneous applicants.

The operations of the Department of Solar Physics, under the direction of Prof. George E. Hale, of Mount Wilson, and at Pasadena, Cal., have made gratifying progress during the year. While the artificers have been busily engaged, at San Francisco and at the shops of the department at Pasadena, in perfecting the mountings and equipment of the 60-inch reflecting telescope, the staff at the Solar Observatory on Mount Wilson has been equally active with the present limited equipment in the work of observation and in the more difficult work of interpreting the observed data.

The telescope just mentioned is now being mounted in a testing laboratory at Pasadena, and its parts are expected to be ready for transportation to the summit of Mount Wilson early next spring. An indispensable adjunct to the observatory on Mount Wilson is a physical laboratory, which has been completed, equipped and put in operation during the year. By means of this laboratory many of the phenomena observed in the sun may be reproduced artificially and studied thus deliberately and repeatedly.

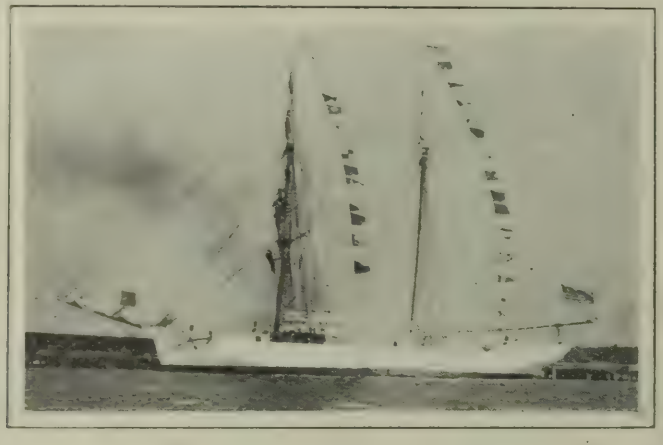
The work of investigation during the year has been done with the aid of the Snow telescope, equipped with the large spectroheliograph and the Littrow spectrograph. The sun is now photographed every clear morning and afternoon with this spectroheliograph, the daily record comprising photographs taken with calcium, hydrogen and iron lines, together with photographs of the chromosphere and prominences in calcium light.

Excellent photographs of sun-spot spectra have been obtained with the aid of the Littrow spectrograph, and these have served, in connection with laboratory studies, in the investigation of the cause of the characteristic phenomena of

spot spectra. The same instrument has been used in a spectrographic investigation of the solar rotation, which has already yielded excellent results.

The extensive researches of the Department of Terrestrial Magnetism have secured during the year large additions to magnetic data from widely separated parts of the earth. Land observations for magnetic elements have been made at numerous stations in the United States, Canada, the Pacific Islands and China, while the observing ship "Galilee" has been continued during the year in the magnetic survey of the Pacific Ocean started during the preceding year. During her first voyage, beginning August 5, 1905, and ending December 9, 1905, this ship traversed circuits aggregating 11,000 nautical miles. During her second voyage, beginning March 2, 1906, and ending October 13, 1906, she traversed circuits aggregating 15,000 nautical miles. The success attending these expeditions has been highly satisfactory from the points of view jointly of quantity and quality of the observations obtained. From the extensive additions to existing knowledge of the magnetic elements of the Pacific thus gained it will soon be practicable to produce greatly improved magnetic charts for the benefit of the rapidly growing commerce of this ocean.

The importance of the problem of human nutrition has caused the Institution to make investigations along three distinct lines. The investigations which have been conducted at Yale University, Wesleyan University and the Connecticut Agricultural Experiment Station have already made important additions to the data which has heretofore been obtained regarding food properties and the effect of feeding and fasting on the human and animal systems. Much has been accomplished thru chemical analysis, especially in determining the composition of various proteins. Grain, vegetables, nuts, seeds of different kinds



INTERIOR OF SPECTROSCOPIC LABORATORY.

as well as flesh, milk and eggs are being examined to determine the proportion of glutanimic acid and other substances yielded. As wheat flour is used so extensively, this grain has been subjected to a very exhaustive study to determine the chemistry of its constituents. The result of these investigations will be to throw much additional light on the conditions producing abnormal nutrition and the remedies which may be available.

The subject of astronomy is being given such attention that the Institution expects to complete a catalog within the next decade, in which all stars down to those of the seventh magnitude inclusive will be located as to their precise positions in the heavens. This work has been in progress under the supervision of Prof. Lewis Boss. To accomplish it successfully a series of observations will be necessary in the Southern Hemisphere as well as our own, consequently a meridian observatory for this purpose will be established in the hemisphere for a period of years at least, as over 15,000 stars must be studied with the view of accurately determining their motion. In fact, a list of about 25,000 is being prepared for observation, of which about one-third are south of the equator. A further idea of the magnitude of this undertaking may be gained when it is stated that a preliminary catalog now in preparation will contain the computed positions and motions of 6,000 stars.

The trustees of the Institution have determined to aid liberally all of the projects which have been decided to be of sufficient importance. Nearly $450,000 will be disbursed during the present year in grants to the various departments and larger undertakings, while about $100,000 has been provided for minor investigations and for the expense of associates and assistants in research. It has been decided to apply a fund of $70,000 for publication, owing to the wide distribution and demand for literature of the Institution. The extent of publication is evidenced by the fact that out of fifty-seven works thus far issued on various subjects, nineteen came from the press during the past year, while thirty-one are now in press. In connection with this a brief reference may be made to a most important division of the Institution's activity—the Department of Historical Research, under the present supervision of Prof. J. F. Jameson. It has revealed remarkable opportunities for the suitable collection and compilation of historical data, especially regarding America, and has further demonstrated the great necessity for such work.

WASHINGTON, D. C.

Crosby Called Back

(Ernest Crosby, poet and reformer, died January 3, 1907.)

BY EDWIN MARKHAM

Author of "The Man With the Hoe," etc.

Crosby, why did you leave us?
We needed you here in the fight.
Why did the high gods bereave us?
We needed your strong arm, believe us,
To carry the torch in the night.

They sounded recall and you started,
And now you are There upon guard,
In the band of the heroes departed,
Still fighting our battle, high-hearted,
Our Captain, our Brother, our Bard.

You went as a knight goes a-faring,
To join the brave comrades above,
To rally where Lincoln and Waring
And Greeley and all of the daring
Still fight in the battle of love.

The Herods of hatred assailed you;
They pricked you with thorns and with spears:
But up in the Light, when Earth failed you,
The heroes of heav'n, they hailed you—
Jones, Garrison, George, and the seers.

High souls that had valor and vision,
High souls that passed under the rod;
Yet held on through scourge and derision,
Still calling the world to decision,
To choose between Mammon and God.

From purple and pomp, you elected
To walk in the gray common road.
To keep your free soul, high-erected,
You joined the despised, the rejected,
To lift at the terrible load.

We saw you, with strong face unfearing,
Make way through the noise of the horde—
Right on through the jibe and the jeering;
And ever to laughter and fleering,
Your song was your answering sword.

What voice will now speak for the humble,
O Crosby—yea speak for us all?
What hand light the way where we stumble?
What hand stay the pillars that crumble,
And put back the stones in the wall?

And now that your errand is ended,
And now that your steps go afar,
What strong soul will catch up the splendid
High dream that your spirit attended—
The purpose of God for our star?

Staten Island, N. Y.

The New President of the University of Chicago

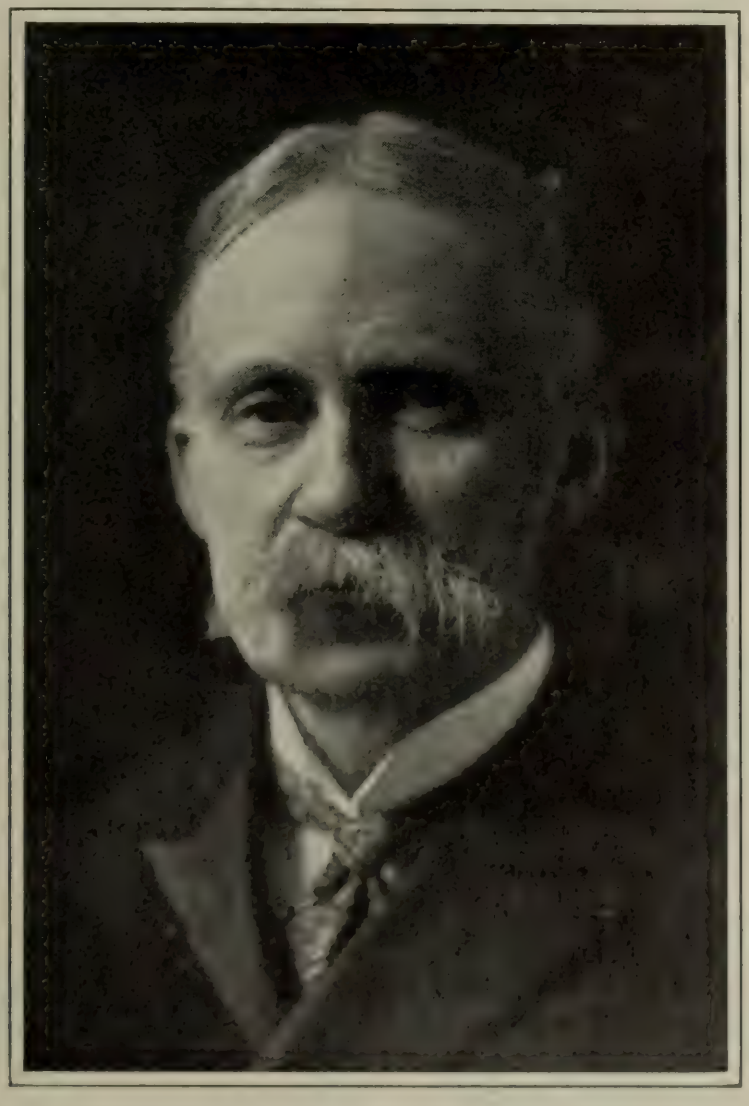
BY SHAILER MATHEWS, A.M., D.D.

[Professor Mathews is Dean of the Divinity School of the University of Chicago, the author of "The Social Teaching of Jesus," "The French Revolution—a Sketch," etc., and other volumes on religious and social subjects. He is also the editor of *The World Today*, the able monthly magazine of current events published in Chicago.—EDITOR.]

NOT long go I asked an exceedingly clever man to write a sketch of one of his friends. His reply was a polite refusal. He said he knew him too well.

Friendship lays no such penalty upon one who knows President Judson. It will permit one to differ with him in matters of policy to the point of frank criticism, but it does not enjoin a public appreciation of his career and fitness for his present position.

Harry Pratt Judson is in the best sense of the word a school man. He is not a creature of that process of precocious specialization with which our higher education is at present afflicted. From 1870 to 1885 he was a teacher and principal of the High School in Troy, N. Y., going there directly upon his graduation at Williams College. For seven years after that he was Professor of History in the University of Minnesota, and in 1892 he came to the University of Chicago as one of the first three choices of President Harper. From that time until this he has borne increasingly the burden of administration of an institution whose administrative like its academic policies have had few precedents and many changes. Thruout these years he has been at the head of the Department of Political Science; has written a number of books especially adapted for schools and the larger reading public; has directed some of the most important research work that has been done in the field of constructive politics; was the first president of the Quadrangle Club; has been dean of the Graduate School and then of the faculties, and has always been a loyal friend and colleague.



In the field of university administration he has been easily the most prominent man in the faculties. It was he who next to President Harper carried into actual working the scheme of the university's management. Other men in the university have talked more and have figured more in the public eye, but Dr. Judson's regulative motive has been efficiency rather than display. He has never sought to be prominent, but has devoted himself to the university with a self-effacement that was as unstudied as it was sincere.

No man in the university has been more concerned in public affairs. For a number of years he was deeply interested in local politics, seeking to advance reform movements by co-operation with that section of the party known as "The Machine." It must be admitted that some of his friends doubted the wisdom of his alignment, and from the point of view of theoretical reform it was certainly somewhat paradoxical. But his influence was none the less felt, and he was enabled to bring about the nomination and election of certain candidates who had some share in developing such moderate reforms as Cook County Republicanism could endure. What was most important, he was instrumental in bringing about legislation insuring direct primaries and a constitutional amendment making it possible for Chicago to seek a new charter.

But President Judson possesses the *savoir faire* which is more than tact, for it is the outcome of a sincerely and genially helpful nature. Since his election to the presidency he has had a number of capital opportunities to make small blunders, but he has not seized one of them. On the evening of his election he attended a banquet given by members of the faculty in honor of one of the former

members of the university, Professor H. H. Donaldson, now of Wister Institute. A less tactful man might have easily spoiled the occasion or at least have diverted it from its original importance. President Judson in an extremely happy way swung an interest that at one moment threatened to center about himself back to its real center, at the same time paying respect to a former colleague.

This sincerity of purpose and utter absence of anything in any way resembling self-seeking is a prophecy of a successful administration. Two years ago men speculated as to who ever could take up President Harper's work. As a matter of fact, fate cast the decision into the lap of circumstance and events made the choice. During the year preceding and the year following President Harper's death, the administration of the university increasingly centered about Dr. Judson as dean of the faculties and as acting president. Until within the last few weeks of his administration in the latter capacity there was practically no discussion as to Dr. Harper's successor. His loss was still too recent and too much felt, but when the question at last was faced the answer had already been given. Dr. Judson was already *de facto* president; it remained only to make him *de jure*.

HARRY PRATT JUDSON.

The new president has made no inaugural statement or speeches upon his future policy. It is doubtful whether he will announce any program beyond one of the most general nature. He is not an educational speculator, but an educational administrator. In a very true sense he is the creature of the university's own life. There can be little doubt that under his administration the share of the faculties in the management

of the institution will be as great as under President Harper, probably greater. The university's business will be conducted with dispatch. President Judson is a man of quick decisions on all matters where large policies are not involved. Then he tempers promptness with reflection. Already there are evidences that research work in the graduate school will be developed. The question of segregation, which flared up so fiercely several years ago, tho all but never mentioned now upon the campus, will not be again agitated. New dormitories for women as well as other buildings will be built. President Judson has already committed himself to the raising of salaries of others than the heads of departments. He is a friend of the undergraduates, but even more of worthy scholarship, and the past year has seen a quiet but steady pruning of undergraduate lists of incompetents or those otherwise undesirable.

The attitude of the faculties toward President Judson is one of cordial support. There will be honest differences of opinion as to policy between them and him in the future as in the past, but unless all signs fail the University of Chicago under President Judson is passing into a new stage of solidarity and development. No man is better calculated than he to serve as leader in this new epoch. He respects the limits set by budgets, he dares refuse requests he would rather grant. He knows the university as no other man now living; he has always been a factor in shaping its general policies; he sympathizes with its ambitions, and he knows its needs and its possibilities. Under him it may be expected to express more fully its own institutional self-consciousness and to enter a period of intensive and extensive but always healthy growth along the lines already established under the leadership of President Harper, and to a very large degree by President Judson himself.

CHICAGO, ILL.

A Simple Solution of the Spelling Reform Controversy

BY FRANK CRANE

OVER and over again have the advocates of spelling reform proved their case, only to be baffled each time by the obstinacy of vested interests and the indifference of the public. To be sure, there is something to be said on both sides; indeed, so much to be said on both sides that we may as well despair of ever reducing our printing to "visible speech." There is, however, a solution of this whole controversy; it is the one herewith submitted, with the glad assurance that it can awaken the antagonism of no one, that it is simple and understandable and practical, that it appeals to all minds who love reason, and that it cuts in one stroke the Gordian knot of our difficulty. It is this:

Instead of trying to conform our spelling to our speech, let us conform our speech to our spelling.

Those who do not at once recognize the dazzling brilliancy of this suggestion may be helped by the following considerations:

1. Spoken sounds are, in the nature of the case, shifting; they change with the generations, and they are different in different parts of the country. The Southerner's words do not sound at all like the Yankee's, neither does an inhabitant of Chicago talk like a native of London. But printed words are fixed. In turning our attention to a reform in speech, therefore, we are dealing with the more pliable material.

2. To change our printed words would involve an enormous expense. All that

vast literature now in type would be rendered useless. School text books would have to be made anew, a point which cannot fail to appeal to the heads of large families. This argument is placed thus foremost, as one which comes home to all classes; to the rich, because they have now hardly enough for their luxuries, and to the poor, because they have little to spare from their necessities.

3. In pronouncing words exactly as they are spelled we would be doing no more than is now done by other races, the German and the Italian, for instance. I remember once trying to ask an Italian lady how she spelled a certain word, unfamiliar to me, that she had used. To my confusion I could not think of the Italian for "spell." Having recourse to the dictionary I was still further dismayed to find that there was no such word in the language. The Italians have no word for "spelling," because they do not have the thing. Instead of lettering a word they "syllabize" it (*sillabare*). When they pronounce a word slowly, syllable by syllable, there can be no question as to how it is spelled.

Now, think of cutting out all spelling books and all the weary hours spent over them; a most unsatisfactory labor, for Dr. Johnson tells us that, while it is no credit to us to be called a good speller, it is a disgrace to be a poor speller. Reflect upon the moments of anguish we have spent wondering whether it was *ie* or *ei*, and no dictionary at hand! All this could be rectified by simply pronouncing the words as they are spelled. It is so easy I am almost ashamed to suggest it.

4. To illustrate how it should be done, let us take a concrete example. Of course we must agree upon certain invariable sounds for each letter or combination of letters. Suppose we take, for convenience' sake, the Continental method, or, more precisely, the Italian, which all acknowledge to be the easiest to pronounce and the most cognate to the English in its sounds. We find here no nasals or gutturals, no German *umlaut* sounds nor French *u*'s. In our proposed speech, therefore, *a* is always *ah*, *e* is *a* as in *bake*, *i* is *e* as in *me*, *o* is as in *bone*, *c* is *k* (following the Latin), *ow* is pronounced as in *how* or *cow*, *y* is simply another form of *i*. We should then read the first verse of "Mary Had a Little Lamb" this wise:

"Mah-ree hahd ah lee-tlay lahmb
Whoh-say flay-kay wahs whee-tay ahs snow (ou)
Ahnd ay-vay-ree whay-ray thaht Mah-ree waynt
Thay lahmb wahs soo-ray toh go."

The rhyme is not, in this instance, as Henri Murger would say, *"assez millionaire,"* but what we lose in consonance we would gain in picturesqueness.

Patrick Henry's famous words would sound thus:

"Ee cah-ray noht what coh-oor-say oh-thayrs mah-ee poor-soo-ay, boot ahs fohr may, gee-vay may lee-bayr-tee ohr gee-vay may day-ahth!"

I leave it to the unprejudiced reader if this does not sound much more as if it would provoke people to fight than the same words as ordinarily recited.

5. There would be no such insuperable obstacles in the way of pronouncing words as they are spelled as there are in the way of spelling words as they are pronounced. To mention but one obstacle, the publishers all oppose spelling reform, and every author knows that the insides of these gentlemen are of brass. The whole country is swarming with geniuses whose young hopes have been blighted by their tyrannical and unreasonable prejudices. But so long as this is a free country we may talk as we please, even if there be certain pestiferous obstacles in the way of writing as we please.

6. The objection may arise that it would be difficult to persuade our fellow citizens to adopt our plain and logical performances with the tongue. The answer is that we should not expect them to come with us all at once. At first only a few choice souls, who are open to the sweet reasonableness of our new style of expression, would adopt the new way. And this would have its advantages. We should be a sort of an intellectual aristocracy. One could tell an educated man just by hearing him talk; just as today, when you hear a person say *law* instead of *lor*, and *idea* instead of *ideer*, you know that there has been something wrong with his bringing up. The policeman at the crossing would have no difficulty, under

the new régime, in recognizing as cultured people a gentleman and lady who should greet one another on this wise:

"'Mee day-ahr Mees Whee-tay. Ee ahm char-mayd toh say yow.'

'Whee! gohd mohrn-eeng, Mees-tayr Smeeth! How ah-ray yow toh-dah-ee, ahnd how ah-ray vowr wee-fay ahnd bah-bee?'

'Ee thahnk yow; nay-vayr bayt-tayr! Eeet ees ah fee-nay dah-ee, ees eet noht?'

'Bay-ah-oo-tee-fool wee-aht-heer een-dayd! Gohd ahf-tayr-noh-on, Mees-tayr Smeeth!'

'Ah-de-ay-oo, Mees Whee-tay!'"

There is naturally much more to be said to strengthen the proposition here made, but it is the aim of this article to be suggestive merely, not exhaustive. Of one thing we may be sure, that if a President of the United States should decide to converse and make his public addresses in this way he could not be blocked on his pathway to reform by any jealous and reactionary legislative body. All the legislators could do would be to accuse him of swearing.

WORCESTER, MASS.

Are We Approaching the End of Our Economic Resources?

BY AARON SAKOLSKI

[Mr. James J. Hill's assertions and predictions always deserve attention. It does not follow, however, that they are proof against criticism. In the following article Dr. Sakolski has carefully examined Mr. Hill's recent utterances concerning an alleged neglect of agriculture, the probable growth of our population, and the size of our supply of iron ore. It will be recalled that Mr. Hill's railroad companies sold or leased, a few weeks ago, to the United States Steel Corporation, deposits of iron ore variously estimated to be from 500,000,000 to 1,000,000,000 tons. Dr. Sakolski is an expert statistician and has done considerable work for the Bureau of Labor at Washington.—EDITOR.]

GLOOMY forebodings of economic disaster are not uncommon in our age. The profession of the prophet, tho no longer specialized, is not altogether non-existent. All men of public affairs exercise it, more or less. The distinction between the true statesman and the public wrangler is merely a difference in their methods of forecasting future events. The statesman seeks to prepare the commonwealth for approaching calamities without creating fear in the minds of the populace, whereas the demagog or professional politician is constantly pointing out possible disasters while neglecting a proper insight into preventatives.

Certainly Mr. James J. Hill, the great railroad promoter, cannot be said to belong to the latter class. His successful career as a captain of industry gives special prominence to his statements, especially when these concern the economic welfare of the country. In a recent address at the Minnesota State Fair, Mr. Hill, among other things, declared: "There must be a national revolt against the worship of manufacture and trade as the only forms of progressive activity." "The tillage of the soil," he proclaimed, "is the most desirable occupation for man, to which every other is subsidiary, and to which all else must yield." Our neglect of this principle will soon bring us face to face with a national economic crisis, for:

"Within forty-four years we shall have to meet the wants of more than 200,000,000 people. In less than twenty years from this moment the United States will have 130,000,000 people. Where are these people, not of some dim, distant age, but of this very generation now growing to manhood, to be employed and how supported? When the searchlight is thus suddenly turned on we recognize not a mere speculation, but the grim face of that specter which confronts the unemployed, tramping hateful streets in hope of food and shelter.

"In the year 1950, so far as our own resources are concerned, we will approach an ironless age. For a population of 200,000,000 people our home supply of iron will have re-

treated almost to the company of the precious metals. There is no substitute whose production and preparation for practical use is not far more expensive. Not merely our manufacturing industries, but our whole complex industrial life, so intimately built upon cheap iron and coal, will feel the strain and must suffer realignment. The peril is not of remote geologic time, but of this generation, and where is there a sign of preparation for it?"

Such bold prediction of economic distress should not be permitted to pass unchallenged, even tho emanating from one so well versed in industrial matters as Mr. Hill.

In the first place, let us examine whether the estimate of our future population, as given by Mr. Hill, is justified. That the population of the United States is growing at a wonderfully rapid rate can hardly be denied. The present ratio of increase is probably double the average rate of Europe, is nearly double that of Canada, exceeds by one-sixth that of Mexico and by one-tenth that of Australia. But we must take into consideration that the United States is not only a new and partially unsettled country, but is also rich in natural resources. Practically speaking, the frontier of settlement of Continental United States was reached about 1880; but since that time the vast tracts of unsettled area have been considerably broken into by isolated bodies of settlement. By means of irrigation and better transportation facilities whole sections of desert land are being converted into populous areas. Continental United States, therefore, may still be said to be extending its borders, tho no territorial growth has occurred since 1870. Only when all the isolated tracts of unsettled area are made habitable will the possibility of growth of population by this means have received a check.

Mr. Hill's estimate of 200,000,000 population during the coming forty years is based upon the assumption that present rate of growth in the number of the inhabitants will be maintained. This, however, is an unwarranted assumption. In fact, from the time of the Civil War there has been a gradual decline in the rate of increase of Continental United States. Between 1880-1890 the increase was 24.9 per cent., and between 1890-1900 it was 24.7 per cent. With the present limitation of territory there may even be an accelerated decline in the rate of increase. This, however, will depend principally upon three factors: (1) the efficiency of labor and capital; (2) the birth rate; and (3) immigration. Under modern conditions of international trade, in countries where manufacturing predominates, almost unlimited numbers of people may be accommodated, since growth is then not limited by the extent of tillable soil, but rather by the growth of capital and the efficiency of labor. If the growth of capital is rapid, the possibilities of employment will be greater, the larger will be the amount of immigration and the greater the excess of births over deaths. In the United States, in 1900, the total amount of capital invested was seventeen and a half times the amount in 1850. During the same period population tripled. Hence we may conclude that altho population will continue to increase as capital increases, the rate will probably decline, and we need fear no such growth in numbers as predicted by Mr. Hill.

Several additional arguments may be stated in support of this view. Among the most important may be mentioned the declining efficiency of labor. By efficiency of labor is meant the possibility of labor creating a greater value than that of raw product worked up. Where raw products are plentiful and the methods of production are economical, the efficiency of labor is usually high. As raw products become less plentiful and more difficult to obtain, however, and as economies in the methods of manufacture are introduced less rapidly, the efficiency of labor, as well as capital, decreases. Under this condition an increasing or steady rate of growth in the population may be looked upon as an economic evil. Both wages and profits decline, while at the same time commodities become more expensive. The result is either a lowering of the standard of living or a rapid falling off of immigration and a lower birth rate. Mr. Hill, therefore, is right in calling attention to the dependence of economic welfare directly upon our supplies of raw materials such as coal and iron.

But is there an approaching danger of

the exhaustion of our natural products? And is it true, as Mr. Hill asserts, that we are neglecting agriculture, the fundamental industry for supporting mankind? Undoubtedly much more could be accomplished along the lines of agricultural development than has been yet attempted in this country, but the query is whether a greater net return employed therein will be created thereby. There never was a time in the world's history when the product of each unit of rural population sufficed to support so large a number of other members of society. This increase in the productiveness of labor in agriculture, arising principally from improvements in farming methods and the use of implements and machinery, is indicated by the decline in the ratio of male agricultural workers to the numbers of acres tilled. In 1880, to every adult male engaged in agriculture, 23.3 acres were under cultivation, while in 1890 the ratio was 27.5 acres and in 1900 it was 31.0 acres to every male worker. The efficiency of labor in agriculture instead of declining, therefore, has been increasing; and the rural exodus of surplus labor has rather helped than hindered the attainment of this result.

Moreover, since 1850 the crop-producing area has increased much faster than the population. The country not only supplies its people with more and better food and with more material for clothing than ever before, but is able, in addition, to export a large part of what would otherwise be surplus produce. If the area of improved land increased at no greater rate than the national population (229 per cent.) in 1900 it would have only been 371,877,300 acres, or 42,915,891 acres less than the actual amount (414,793,191). This large expansion of cultivated areas has come about in spite of continual declines in farm values in New York and New England.

Tho the extent of cultivated area has increased greatly during the last half century, the ratio of improved to unimproved farm land has varied only slightly. This may be evidence of lack of intensive cultivation; but it by no means indicates lack of agricultural development. While intensive farming is profitable in certain countries of Europe under existing conditions, in the United States it cannot compete with the system of large scale farming. Under the latter system it is impossible to employ advantageously the most improved machinery and mechanical power. Production in this way is cheapened even tho the quantity of product per acre may be less than under intensive cultivation. The development of transportation facilities frequently places the small intensive cultivator at a disadvantage. The fact that nowadays produce is shipped from the Western plains and the Pacific coast in refrigerating cars at a relatively small cost, is one of the principal causes of the decline in farming values and the numbers of rural population in sections of New York and New England. Under the present state of agricultural development no section of the country has reached such a degree of self-sufficiency as to be independent of other sections, both for means of subsistence and for materials of manufacture. The development of large centers of trade and agriculture, therefore, is dependent upon the distribution of staples to various consuming uses thruout the world. Whether a certain country becomes a manufacturing or an agricultural region will depend largely upon the possibility of successfully competing in these directions with other countries. Each country ultimately will produce that which it can produce with the greatest net returns to capital and labor.

But does not this principle frequently lead to economic disaster thru the sacrifice of future welfare to present net gain? This thought was undoubtedly in Mr. Hill's mind when he called attention to the danger of too rapid consumption of our supplies of coal and iron. Here again, however, Mr. Hill's predictions may be seriously contested. It is now about forty years since the English economist, Prof. W. Stanley Jevons, made use of the same argument in his book on "The Coal Question," in which he predicted that by the end of the century England's commercial and industrial supremacy would be checked by her inability to supply the ever-growing demand for fuel. This prophecy, tho based upon sound scientific reasoning, however, has proven false. New countries have opened up for Great Britain new sources of supply. In addition to this she has been enabled to

maintain a leading place among the nations by reason of superior industrial organization. But the United States, as far as natural resources are concerned, has always been more strongly fortified than Great Britain, and consequently the exhaustion of her supplies may be placed at a far more remote date. Prophecies of the exhaustion of iron ore and coal depend for their fulfilment on a practical continuance of existing conditions. Yet other fuel or means of procuring mechanical power are gradually taking the place of coal, and other metals and construction material successfully compete with iron. The long-distance transmission of electrical power, generated by means of natural waterfalls, is no longer in the experimental stage; while concrete is rapidly displacing iron and steel in the construction of buildings and bridges.

But setting aside these considerations, is there a possibility of the exhaustion of our important mineral deposits within the half century period stated by Mr. Hill? It must be admitted at the outset that there are no reliable estimates of the full supply of iron ore or of coal deposits in either the United States or Europe. The question today is of the world's supply; but there is nothing upon which we may even base an approximate estimate of the mineral value of the earth's crust. Limiting our inquiry to the supply of anthracite coal, practically all of which is contained in Eastern Pennsylvania, in a region of 1,700 square miles, there is probably some ground for estimating the full supply. Such estimates, however, have been nothing more than guesswork carried to an extreme. In 1877 Mr. R. P. Rothwell, in the *Engineering and Mining Journal*, computed the probable exhaustion of the supply in ninety years, *i.e.*, in 1963. Other estimates placed the year of exhaustion, on the basis of the present rate of consumption (50,000,000 tons annually), at 2031 and 2060. All authorities agree that the difficulties of mining anthracite in the future will tend to greatly increase its cost and diminish the demand. Accordingly, for all practical purposes, the exhaustion of anthracite is not so remote as to be incalculable. Such is not the case, however, with the bituminous coal, which is rapidly displacing anthracite in many uses. Bituminous coal occurs in so extended a territory in the United States—known deposits covering about 300,000 square miles—that it is utterly impossible to form any estimate of the total amount available for the future.

Regarding the supply of iron ore in the United States, a capable authority, Mr. John Birkenbine, who has been an expert of the United States Geological Survey during the last seventeen years, scoffs at the idea of a scarcity of the product in any but remote times. New discoveries of iron ore deposits are constantly being made, while mines which have been worked for a period of from fifty to one hundred years are still producing ore. Future supplies, however, will undoubtedly be more expensive to obtain unless cheaper methods of mining and handling are constantly introduced and much of the waste in the process of smelting is eliminated. At the present time each ton of pig iron produced requires about 2½ tons of ore.

One of the gravest considerations in connection with the probable exhaustion of our coal and iron deposits is the enormous increase in the rate of consumption of these products during the past century.

In 1850 the per capita production of coal was only 0.278 tons. In 1880 it had increased to 1.43 tons per inhabitant, in 1890 it was 2.05 tons and in 1900 it rose to 3.53 tons. While the population of the country between 1850 and 1900 increased 230 per cent., the production of coal increased 4,084 per cent. The increase in the production of pig iron has been on a somewhat similar scale. During the first half of the nineteenth century this country produced 11,000,000 tons; between 1850 and 1875, 31,000,000 tons, and during the remaining period up to 1904, 245,000,000 tons were produced. Assuming that this rate of increase in production will continue, about 7,500,000,000 tons of iron ore will have to be taken from the ground for our own use during the present century, since, as we have already pointed out, it takes about 2½ tons of ore to produce one ton of pig iron. The United States now leads the world in the production of pig iron in proportion to population. In 1850 it ranked second, producing but 53 pounds per inhabitant, whereas the United King-

dom produced 190 pounds. In 1903, however, the per capita production of the United Kingdom was 470, while that of the United States was 504 per cent.

Do these figures represent a waste of our natural resources? Or are we uselessly consuming in this age what should be saved for the next? It is a well-known fact that not only was a large portion of the anthracite deposits needlessly wasted in the mad rush to bring it to the markets, but our natural gas and oil deposits have been ruthlessly exploited. The constantly rising price of these products warns us of their impending exhaustion. That the same condition does not prevail in the bituminous or iron industries should not lead us into the belief that the supply of these materials is inexhaustible. Several centuries may pass before even a slight scarcity may be felt, but even a remote period of time deserves our consideration. It is the duty of the Government to provide for the welfare of the future generations, but in our own case this duty has been sadly neglected. By our game and fish laws we aim to prevent the extinction of certain forms of animal life which serve as food supply. The same principle may be extended to the preservation of our mineral and metal supplies, which do so much toward the satisfaction of human wants.

NEW YORK CITY.

The Knight and the Priest

BY IVAN SWIFT

A SINGLE taper flaming dim and low
  Played fitfully on relic altar-gold;
  Thru windows wrought with miracles of old
Fell faint the saffron of the afterglow.

Before the penance-bench Sir Hardistan,
  Scarce more than youth, of sturdy limb and fair,
  Knelt down as under longer years' despair
That marked his brow with age ere age began.

Within the shadow stooped the solemn priest,
  In patience with the sorrows of the years—
  His cup of life o'erfilled of others' tears,
Had spilled his tragedy as theirs increased.

"Sir Knight, I keep the refuge of the poor—
  Here knees of plaintive misery are bent
  When worldly wares and light of life are spent.
Thou'rt not of these, but yet in strength secure."

"Father, I wander thru the endless night,
  And the pale moon to me appears but rare
  I seek, the last, thy famed candle flare
To light my way and stumbling steed aright."

"What meanest thou, Sir Knight?—Hast naught of home?"
  "Aye, Father, home—such home as all men seek—
  And wife and child—and stud and stables sleek,
And gold to grace a triumphry of Rome."

"Grieve not, Sir Knight, if erst thy jousting failed."
  "No conflict but a conquest, holy one—
  The bravest have engaged me and are done
With tournaments, whilst I am victor hailed."

"Find'st no weal in neighbor, friend or kin?"
  "Thy pardon, sire—thou speak'st in language worn.
  Can mortal fellowship be bred of scorn?
The wolf am I; the whimpering folds are men."

"Mayhap thy alms are sown to thankless soil."
  "Alms? Alms?—Wouldst fling thy beads to craven oaves?
  My gift is steady steel—outlasting loaves!
But haste!—the serpent Night doth loose her coil!"

"Haste romps, Sir Knight, without the cloister gates—
  With such as thou on worldly roads it runs.
  In vain pursuit of far retreating suns!
My humble lamp will serve but him who waits.

"Thy pride, thy steel may ward the wanton's way!
  God's love for love; His mercy for thine own!
  Turn back whence thou has come—contrite, alone—
Beyond the east awaits the dawn of day!"

HARBOR SPRINGS, MICH.

Literature

Wells on America*

"To see oursels as ithers see us" is a privilege granted to Americans without stint, since every European visitor who "writes" tells the world how our immensity impresses him. But few observers come so well equipped as Mr. Wells to understand our crude modernity. He welcomes joyously the scientific and mechanical spirit that is transforming the material world; he casts no backward, reluctant glances as he sees us flying from the ages of romance; he sees ahead

H. G. WELLS.

a more healthy, just and intelligent society into which our uproarious, chaotic age may pass. So clear and far-reaching were his theories before he left Liverpool that one suspects many of these pages were virtually composed ere he sighted Liberty statue.

Tho a few of the pages might have been modified had the writer prolonged his visit, none the less they are worth perusal, not alone for the criticisms themselves, but also for the charm of the literary art with which they are expressed. Mr. Wells skimmed, bird-like, over our bustling continent in search of the American guiding idea, the purpose that thru our whole activity runs. He was disappointed not to find among our leaders more thought upon our destiny, more deliberate planning for distant ends. Mr. Wells sees that in practice we have well nigh abandoned the narrow, benumbing conception prevalent so long that the government should merely keep the ring while individuals fight for the spoils. This conception is no longer accepted except in musty, remote classrooms. But a positive purpose for our civilization has not yet been substituted. We have been so busy collecting the materials for a higher civilization that we have not had time to decide upon the complete plans for the structure. America's early political philosophy, summed up in the injunction: "Give free scope to personal effort and then common welfare will inevitably be fostered," was favored by the conditions under which the continent was opened. Only

* The Future of America. By H. G. Wells. New York: Harper & Bros. $2.00

within the last decade or so have industrial developments forced upon reluctant Americans the truth that equality of opportunity cannot be preserved except thru patient, collective regulation of industry.

Mr. Wells was astonished to find that the dim, pulsating crowds of recent immigrants already had money to spend. So far their enterprise in coming had been justified to themselves. But the national problem set by their ever-increasing swarms, Mr. Wells suggests, as well as the menacing problems of the race question and of the souring conflict between laborers and employers, we are not taking with sufficient thought and seriousousness, tho they are sphinx riddles which we can leave unanswered only on pain of being devoured.

That such problems will solve themselves if the politicians and statesmen will but leave them alone has been the fatalistic assumption of most Americans hitherto, and Mr. Wells laments the endurance of that happy-go-lucky attitude. His chapter on "The Tragedy of Color" has helped to stir the thought which he rightly considers essential to a solution, for it has been widely read by Southern negroes, and is quoted by them now to visiting Northerners. Mr. Wells did not discover the whole of the stiff thinking and eager discussion upon our national problems that goes on in White House, universities, schools, magazine offices and private libraries. It was also a trifle unfair for him to expect that young America should have clearer conceptions of its future than has the ancient land of his birth. He hoped too much from democracy. Nevertheless, the present ferment over the railroads, the agitation about municipal ownership, the work of child-labor committees, the enthusiasm for popular education, the real tho belated progress of the South in the provision of schools and colleges, and the output of sociological articles by magazines, both popular and academic, all indicate that America is waking to the consciousness that upon its informed decision and moralized will, rather than upon chance developments and witless competition, should rest the future of America.

Poetry, Old and New

THERE is nothing in the collection of

ILLUSTRATION FROM DUNBAR'S "JOGGIN' ERLONG."
Dodd, Mead & Co.

Paul Lawrence Dunbar's work, under the name of *Joggin' Erlong*,[1] published after his death, to compare with some of his earlier poems, and the book is in its make-up decidedly overdressed. If the poems were more distinctive, the pho-

[1] JOGGIN' ERLONG. *By Paul Lawrence Dunbar.* New York: Dodd, Mead & Co. $1.50.

tographic illustrations of negro types and the bandanna cover would not overweigh them to such an extent, but the elaborate marginal decorations are inharmonious in any case. The only approach to poetry in the book is the last dialect poem that was written by the well known singer, beginning:

"Sling along, sling along, sling along,
De moon done riz,
Dem eyes o' his,
Done sighted you,
Where you stopped to woo.
Sling along, sling along,
It ain't no use fu' to try to hide,
De moonbeam allus at yo' side,
He hang f'om de fence, he drap f'om de limb,
Dey ain't no use bein' skeered o' him.
Sling along, sling along."

A characteristic sketch of the negro of today, with excellent illustrations, is "An Ante-Bellum Sermon." But the volume *Joggin' Erlong* will add nothing to the laurels won by the young negro poet, and it is only just to recall in this connection a stanza from his "A Death Song" in an earlier book.

"Lay me down beneaf de willers in de grass,
Whah de branch'll go a-singin' as it pass,
An when I's a-layin' low,
I kin hyeah it as it go,
Singin', "Sleep, my honey, tek yo' res' at las'."

The larger part of the fugitive verse of Mildred I. McNeal-Sweeney in *When Yesterday Was Young*[2] is descriptive, and suggests that the brush might have served her better than the pen as a means of expression. Also nearly every one of the poems in the book seems a *tour de force*. A phrase, a line, or, at the most, a stanza speaks; the rest is deliberate verse-making—elaboration. Those poems most condensed are the best. Most of them are too long; in these, the occasional poetic touch does not suffice to carry them. Many of the poems are general, more are descriptive of nature or of places, as "The Dawn Child," "The Clover," "Bells of Amalfi," "New York Bay at Dusk." A few are legendary, historical or personal.

There are anthologies without end, but the question is are not the minor poets better employed in rearranging and reprinting great compositions of the past than in making little ones of the present. *The Friendly Town*[3] is compiled by an anthologist who had already collated poetic testimony to the supremacy of the country and of nature. This volume sings of things urban, sophisticated. Says the compiler, in his foreword:

"When still in the season
Of sunshine and leisure,
While blithe yet we wander
O'er meadow and down
O say is it treason
To think of the treasure
Heaped up for us yonder
In gray London town?

The contents of this volume (which gives no American poets except Longfellow, Holmes and Lowell) offer weighty burden of proof in prose and verse, from Lamb's eulogy to roast pig to Landor's epigram:

"I strove with none, for none was worth my strife;
Nature I loved, and, next to nature, art;
I warmed both hands before the fire of life;
It sinks, and I am ready to depart."

The Pilgrim's Staff[4] is a collection of Poems Divine and Moral. Here the theme that inspires the selection is universal, the pieces are many of them masterpieces, and all are expressions of the greatest reflections of great men. The little volume cannot but be weighty. Typographically it is perfect. Done in the manner of the seventeenth century book, it is illustrated with portraits excellently reproduced from old engravings. The cover bears a Crusader's arms, crowned by the Pilgrim's hat and garlanded with lilies and palms. In all this lofty sentiment upon the critical aspects of life from Spencer to our own time we have reason to be proud of our moderns. Henley's brave "Invictus" is here:

"Beyond this place of wrath and tears
Looms but the Horror of the shade,
And yet the menace of the years
Finds and shall find me unafraid."

and Stevenson's dauntless Requiem:

"Under the wide and starry sky
Dig the grave and let me lie:
Glad did I live and gladly die,
And I laid me down with a will.
This be the verse you grave for me:
Here he lies where he long'd to be;
Home is the sailor, home from the sea,
And the hunter home from the hill."

However ungracious we may be to *new*

[2] When Yesterday Was Young. *By Mildred I. McNeal-Sweeney.* New York: Robert Grier Cooke. $1.50.

[3] The Friendly Town. *By Edward V. Lucas.* New York: Henry Holt & Co. $1.50.

[4] The Pilgrim's Staff. *By Ida Rey Carrington.* New York: Duffield & Co. 75 cents.

poets, we are always overflowing with appreciation for those singers whose minstrelsy has already won us; and we sympathize fully with the Indiana State Teachers' Association who insisted on paying tribute to James Whitcomb Riley in spite of the latter's well known aversion to public demonstration. The little volume[5] giving an account of this assembly in the poet's honor includes, besides the witty and genial addresses made by Senator Beveridge, Meredeth Nicholson, Henry Watterson and others, and the response by Mr. Riley, a sketch of the latter's life. In this is recounted the hoax that he and a friend perpetrated in connection with the writing of "Leonainie," which they represented as a hitherto unpublished poem by Poe. They were all too successful, and had very shortly to reveal the genuine author in order to quell the excitement they had created and its consequences.

Modern Poets and Christian Teaching

THE six small volumes of this title* serve a valuable purpose. Philosophy and psychology are learning that the emotions may bring us truth that the reason alone cannot reach, and religion, which is profounder than a mere rational science, claims a formidable ally in the poet with his intuitive grasp of truth. The volume on Tennyson most justly declares of that poet: "He opened the way, almost before its philosophers and priests had found it, for the reconciliation between the conclusions of science and the intuitions of the heart concerning the reality of the spirit and the personality of God," but wisely refrains from any definite formulation of the poet's belief, admitting that his insight is spiritual and not formal. The writer is particularly happy in interpreting the poet's thought in the light of the intellectual turmoil of his age, quoting Jowett's remark to the laureate: "Your poetry has an element of philosophy more to be considered than any regular philosophy in England." That he was infused with a deeply moral emotion is evidenced by the serious undercurrent of almost every important poem, yet it must not be forgotten that the conscious moral is secondary in the poet's mind; the primary motive of art is the infinite cry for expression of emotions that cannot be stifled, and the moral character of his work is the reflection of the man back on his art, not its first purpose. And this is better, since we get a vision wider and deeper than his formulated moral thinking, as inspiration must always be deeper than logic.

Browning's militant optimism, as the author of that volume shows, was far stronger than a merely rational faith, and leads the poet, somewhat to the commentator's dismay, to attack the validity of the human reason, seeing that to find reason always valid and sufficient discredits emotion which oft-times transcends reason, yet it is by the eternal truth of the spirit's intuition that Browning knows "all's right with the world." The poet's conception of love as the universal force, the gospel of salvation, the conclusive argument for a personal and incarnate God—a belief which dominated Tennyson and Lanier as well—is inspiringly handled, as also his spiritual test of life. Temptation and difficulty are but the trying ground of the soul, the only unpardonable thing in existence being not defeat, but refusal to fight, since success is not outward achievement, but the victory of the will. Browning's whole interest lay in the "development of the soul; little else," as he himself says, "is worth while." Withal this volume is the most genuinely inspiring of the set, in its sympathetic rendering of the poet's rushing optimism.

The treatment of Lanier is engaged as much in a setting forth of the poet's aspiration, pure, devoted, courageous, as an interpretation of his poetry, and better so, for, true to his ideal, Lanier's life was the truest art of him, and in spite of a mystical temperament his richly spiritual imagination did not lose hold upon the problems of today. The volume of Gilder, Markham and Sill

[5] IN HONOR OF JAMES WHITCOMB RILEY. Indianapolis: The Bobbs-Merrill Co.

* MODERN POETS AND CHRISTIAN TEACHING. 6 Vols. Tennyson, by *William Emory Smyser*. Browning, by *Frank C. Lockwood*. Sidney Lanier, by *Henry Nelson Snyder*. Lowell, by *William A. Quayle*. Matthew Arnold, by *James Main Dixon*. Gilder, Markham, Sill, by *David G. Downey*. New York: Eaton & Mains. $1.00 each.

evidences deep moral feeling in these younger American writers, a feeling that too frequently smothers their artistic power. Gilder is rich in Christian thought, while Markham, with more of the real poet's clothing of his thought in action and concrete imagery, stirs us by his ringing cries for Brotherhood.

Of religion such as the expositor sought Lowell offers little enough. He preached humanity rather than religion, and it was a mistake to seek it, but the book does portray the moral undercurrent of the poet's thinking, his hatred of slavery, his call for moral vigor, his gospel of unselfish devotion, so exquisitely phrased in "Sir Launfal's Vision." The volume on Arnold is an unfortunate attempt to interpret a poet unsympathetically. It should not have consumed so much space to prove his poetry unsatisfying from any orthodox standpoint, or that his keen intellectualism does not fully interpret life.

These volumes, wrought out for the most part from the preachers' point of view, are hardly conclusive as to the religious thought of the poets treated; they show where the poet spoke in the language of modern theology, rather than reconstruct for us his complete religious thought, yet they prove the intimate alliance between poetry and all religious feeling, not in form, but in spirit, and are a most valuable storehouse of applications to Christian teaching of poetic faith with its moving power.

On the Great American Plateau. By T. Mitchell Prudden. New York: G. R. Putnam's Sons. $1.50.

Mr. Pruden has written a very readable book on the southwest plateau which Mr. Van Dyke has treated in his iridescent fashion in "The Desert." No one can fail to catch a little reflected glow of enthusiasm from this journal of nights and days spent among the "cañons and buttes in the land of the cliff-dweller," and "the Indian of today." The names scattered like the jewels of a broken necklace about this region are enough to set one dreaming! Who would not like to wander along the "Bright Angel Trail," across the "Painted Desert," thru "Marble Cañon" and "Lost Gulch," under "Echo Cliffs" and pitch camp on the "Mesa Verde?" Of course, the author

THE MAKING OF A NAVAJO BLANKET.
From Prudden's "Great American Plateau." Putnams.

tries to describe the Grand Cañon of the Rio Colorado—and of course he fails as even Charles Dudley Warner did before him, but by reiteration of its splendors he manages to leave upon the mind of the reader a confused sense of its magnificence. The chapters upon the "cliff-dwellings" and the Hopi and Navajo Indians are full of interest, and there are many photographs of the scenery and people of the American Desert, showing by sharp lines the unfailing blaze of sunlight in which they were taken.

Studies in Pictures. An Introduction to the Famous Galleries. By John C. Van Dyke. New York: Charles Scribner's Sons. $1.25.

Any one who has watched the tired tourists trooping thru a picture gallery, either trying conscientiously to find something endurable in old masters which they have been told they should admire, or with ostentatious independence and defiance rejecting at a glance the established consensus of opinion, will realize the need for just such books as this. Professor Van Dyke is a helpful cicerone, for he does not overpower the reader with his theories, or force upon him his tastes, or crush him with the weight of his learning, but talks clearly and sensibly about what pictures are painted for and how we can get the most out of them. The first half of this book is devoted to explaining under what conditions the old masters worked and how their productions suffer from being cleaned, restored, wrongly lighted, falsely placed and generally misunderstood. Then he discusses the different kinds of paintings—figure, genre, portrait, animal, landscape and marine. He uses few technical terms and none of the painter's, or rather the connoisseur's, cant. His points and allusions are illustrated by thirty-nine full page halftones. If he does not succeed in weaning the reader from Bouguereau, Tadema, Landseer and Vibert, at least he will have taught him how to appreciate other pictures, which formerly appeared to him merely "ugly," like the unknown lady by the unknown artist in the Poldi Museum.

UNKNOWN LADY.
By Piero della Francesca (?) in the Poldi Museum, Milan. From Van Dyke's "Studies in Pictures." Scribner.

The White Cat. By Gelett Burgess. Indianapolis: The Bobbs-Merrill Co. $1.50.

Mr. Burgess is economical in the matter of heroines. He has one heroine engaged to two men at the same time. This is not so unusual a state of things either in novels or real life as to attract attention; the peculiar thing about this case is that the *fiancées* are very different girls, altho they have the same body, which they alternately dominate. This device save the author the trouble of describing two types of feminine beauty, altho he has still to get up two sets of mental and moral idiosyncrasies. This he accomplishes readily by applying his method of psychological classification, making one a bromide and the other a sulfite. He has also to stock up two distinct wardrobes, but this matter he has carefully attended to. We have not here an ordinary case of feminine duplicity; it is a real double personality. We do not ordinarily give away an author's plot in this way, but it does not matter, because any reader endowed with ordinary perceptive faculties or experienced in novel reading will discover the secret long before he catches a glimpse of the *Journal of Abnormal Psychology* on the library table, and it will not impair his zest for reading the whole story of this psychological civil war. For the story is a fascinating one, tho not so interesting as Dr. Prince's "Dissociation of a Personality." Edna is not so vixenish and tricksy a sprite as Sally. Stevenson got ahead of the doctors in "Dr. Jekyll and Mr. Hyde," but most of our romancers nowadays trot behind the scientists. *The White Cat* is handsomely illustrated by a man who did not read the book.

The Doctor. By Ralph Conner. New York, Chicago and Toronto: Fleming H. Revell Co. $1.50

Ralph Conner needs no introduction to American readers. This new story of the Rocky Mountain regions is written in his usual stringent style and abounds in thrilling situations. Perhaps no living author understands better how to use the competitive spirit in human nature to greater advantage in a dramatic way than does Mr. Conner. In this story, as in all the others he has ever written, the good man pits himself against adverse circumstances and wins. And there is something hearty and stimulating in such *denouements,* which accounts in a great measure for this author's popularity.

The Nature of Capital and Income. By Irving Fisher, Ph.D. New York: The Macmillan Co. Pp. xxi, 427. $3.00.

In comprehensive analysis and richness of details, this book is more characteristic of the work of a German than of an American economist. The author, who is a professor of political economy at Yale University, has devoted a number of years of diligent study to his subject, having contributed considerable literature thereon to the current economic periodicals. His endeavor has been to exhibit definitely the modern economic concepts of capital and income, with all the facts and theories relating thereto, but in the present volume his attention is chiefly devoted to the relation between capital and capital-income in the value sense. In solving this important problem of economic science, Dr. Fisher skilfully employs the diagramatic method after the manner of the Austrian-Jevons school of economists. He is very careful, however, to relegate abstruse geometrical and mathematical formulæ to the appendices of the book. Stated briefly, the theory of Dr. Fisher regarding the nature of capital is that "those parts of the material universe which at any time are under the dominion of man constitute his capital-wealth; its desirability, his subjective capital." The stream of services which flow from this capital-wealth (*i. e.*, land, labor and transferable goods) represents the discounted value of future expected income, minus the accumulated value of past outgo, or capital-wealth consumed in the production of capital. "When values are considered, the causal relation is not from capital to income, but from income to capital; not from present to future, but from future to present." Capital employed in each preliminary process of production is ultimately dependent on the value of the income of the capital employed in the final process, for the value of the earlier capital is nothing more than the discounted value of the capital it produces. The author admits that modifications in this theory of capital value and income are necessary when an element of uncertainty is introduced in the discounting operations. Probably the only radical departure from conventional economic principles in Dr. Fisher's treatise is the inclusion of human population in the capital concept, because, as he contends, "these are objects owned."

How It Works. Dealing in simple language with Steam, Electricity, Light, Heat, Sound, Hydraulics, Optics, etc., and their applications to apparatus in common use. By Archibald Williams. 12mo, pp. xii, 461. New York: Thomas Nelson & Sons. $1.25.

A better Boys' Own Book, for big boys and young men it would be hard to devise. The machinery in common use which every one sees, mechanical, electrical, optical, used in the house, on the farm, and in transportation, is described in simple terms, its principles explained and illustrated abundantly, by sections showing its construction of steam engines and turbines, of automobiles and balloons, of telegraphs and telephones, of railway brakes and block signals, of pianos and organs, of phonographs and gramophones, of barometers and diving-bells, of meters and filters, of locks and clocks, of cycles and threshing machines. This is no book for the engineer, as it gives principles rather than the more complex fittings of the most elaborated machines. Hardly any other volume will answer as many of the questions that a bright boy asks and ought to ask about the things he sees and uses. It should head the list of books to be bought for school libraries.

A Break in Training. By Arthur Ruhl. New York: The Outing Publishing Co. $1.25.

A few years ago we came across a story with this title, and we tore it out of the magazine in which it appeared and filed it away in a big manila envelope labeled on the back "The Twelve Best Short Stories in the World." Into the same scrap-box envelope went later —which by that time held more than a dozen, but we intended to weed them out some time and try to get the set published—two other stories, entitled "Left Behind" and "The Men They Used to Be." We did not notice that they were by the same author until now, when they turn up in a single volume, together with five others, good, but not so good. They all deal with the same subject, track athletics, yet with astonishing variety in style and treatment. They could not have been written before Kipling, but they are none the worse for that. We should like to see Kipling beat them. Their distinguishing quality is their decided masculinity. This is an age of feministic literature, when most stories are written of women, by women or for women. The male authors who want to prove themselves men generally resort to brutality and coarseness, without, however, even in those lines escaping feminine competition. But these stories are clean and wholesome, yet emphatically *manly*. We would venture to say that there are two passages in the first story, the descriptions of Miss Halloway on the golf links, and of the dinner that followed, that no woman could have written, but we are deterred from such a sweeping statement by remembering what befell the critics who reviewed the early novels of George Eliot, George Sand and Charles Egbert Craddock.

ARTHUR RUHL.

Charleston: The Place and the People. By Mrs. St. Julien Ravenel. New York: The Macmillan Co. $2.50.

This is the fifth of a series of informal histories published by the Macmillans of famous American cities. And it would be interesting to compare Mrs. Ravenel's story of Charleston with that of New Orleans by Grace King, or of Philadelphia by Agnes Repplier, or of Boston by De Wolf How. In this way we should discover the admirable, but contrasting, elements which went to make the American people before this country was spotted and debauched with the scum of European immigration. The men who settled the "Goose Creek" plantations in the South Carolina Province were not the cast-off paupers of other nations, but they were gentlemen of breeding and substance. The author of this volume tells us that she has

> "Simply chosen from its (Charleston's) story of two hundred and fifty years such events as seem to her to have had most to do in shaping the fortunes of the men who made the town, as best to illustrate the character of their children who have lived in it.'

Some of us will be surprised to realize that the life of Charleston is so short. The people who hail from there wear the baronial air of having lived and descended from themselves for at least five hundred years. And this reminds us to say that while no mention is made of it, the author of this book may be the Mrs. Ravenel who offered her friends a cake made from a receipt given her by a lady in Baltimore, and ever afterward it was known as the Lady Baltimore cake. In any case, she belongs to that lovely faded wreath of elderly gentlewomen to whom Owen Wister pays so many gallant tributes in his late novel. Events lie quiet in her mind, which gives them the right perspective. They do not hawk and claw at her heart nor demand the sort of shrieking expression so common among a younger class of women writers who were not brought up in Charleston. And her attachment to the past is evidenced by her half timid defense of the *code duello*. She says very naïvely that she can remember but three "fatal" duels. And commenting upon the practice she adds:

> "The evil was great, but some things can be said in its favor. The knowledge that an account would be required of his words and actions brought constantly to a man's mind, not as a menace, but as a principle, the belief that his words were a part of his character and his life. False or cruel speech was to be answered for as was an evil act; it, there-

fore, was held *to be* an act, not mere empty breath, as it is too often considered now. . . . One who can remember the exquisite urbanity of social intercourse of fifty years ago, and contrast it with the careless expressions, the rough give and take, of the present, can but wonder how much the old way had to do with the self-respect and consideration for others of that society which people now call half civilized."

In short, the book is of peculiar interest, not only for the information it contains, but for the manner in which all is presented.

Fishing and Shooting Sketches. By Grover Cleveland. New York: The Outing Co. $1.25.

Our readers will remember that our veteran ex-President, who on March 18th celebrated his seventieth birthday, has contributed an article on hunting or fishing to the annual Vacation Number of THE INDEPENDENT for the last four years. These have now been collected and republished with six similar articles from other periodicals in a small volume illustrated with pen sketches by Henry S. Watson. As our readers know, Mr. Cleveland is an ardent advocate of "the outdoor life," and this book will help to win converts to his cause.

The Sword of Wealth. By Henry W. Thomas. New York: G. P. Putnam's Sons. $1.50.

But for the fact that the names of characters and places are Italian, the reader of this story might easily think that the scenes were laid in a Massachusetts mill town instead of where they are, in Lombardy. It is the same old tale of industrial slavery with which we have become so familiar, only the capitalist is a Sicilian rogue, the hero is a Socialist, and the rioters are Italian peasants. It is needless to tell that the capitalist is a mean man and meets a bloody death, because that has become the invariable character of the rich man in fiction and his inevitable fate if a single laboring man is admitted to help out the movement and measure of the tale. The question is, Why does the capitalist always fall one way or the other by the hand of his outraged employees? Does such a *denouement* actually represent the temper of the modern mind, or is it the charlatan and easy method lazy novelists have of dramatized retributive justice? If it is the latter, no importance is to be attached to the astonishing mortality among trust makers in fiction, but if it is the former, there is cause for alarm. It never has been possible to reform society by riots and murder, some Socialists like Mr. London to the contrary notwithstanding.

The Far Horizon. By Lucas Malet. New York: Dodd, Mead & Co. $1.50.

"A nostalgia of wide, untenanted spaces, of far horizons, of emotions at once intimate and rooted in things eternal, was upon him."

In such words Mrs. St. Leger Harrison characterizes the dominant mood

Illustration from Cleveland's "Fishing and Shooting Sketches." Outing Pub. Co.

of her hero, and voices the longing for home of the human soul whenever it becomes conscious of its own immortality and its nearest needs. Did not some good Protestant divine call it "a heavenly homesickness"? This hero and good man, a somewhat unusual combination of qualities in current fiction, Dominic Iglesias, is not a Protestant, but a world-weary Catholic, turning to the Church as to a window facing the far horizon he would seek. He is not "world-weary" in the usual sense, for he has lived a singularly blameless life as a bank clerk in business, as a chivalrous gentleman of spotless repute in private life. He has a strange charm for the "Lady of the Windswept Dust," Poppy St. John, an ex-actress, an adventuress, a woman with an unsavory Past and a dubious Present. The singular friendship of the two unlike natures is the theme of the story—a story so well told, so finely finished, with such real people of the British middle-class sort moving thru its pages, that the critical faculty is disarmed from the first, and one yields to the charm of unique art. How very good they are—these minor characters and understudies! The girlish Serena Lovegrove, of, perhaps, eight-and-forty autumns, who clutches her older self at eighteen by the skirts in a desperate grip and will not let her go; "good" George Lovegrove, whom no other adjective could quite describe; the incomparable group at Mrs. "Peachie" Parcher's boarding-house table; even the gray little caretaker, "with a taste for literature"—here is artistry of unusual perfection. The banker and the vicar are not so happy in their presentment. We,

WANTED A CHANGE.

Young Twentyperr looked carefully before a wife he took,
His wife would have to know a thing or two,
He wanted to be certain that his spouse knew how to cook
The way his mother didn't use to do!

[The vexed question of *Why They Married*, which outsiders can never understand but are always wondering about, is settled for about fifty selected cases by James Montgomery Flagg in verses and sketches like the above. New York: Life Publishing Co. 75 cents.]

frankly, do not believe in them at all. And we question the fairness of the author, in painting her one Catholic so superbly, and her several Protestants so badly; the contrast loses force when we doubt its truth. Still, we do not agree with those critics who have found in *The Far Horizon* a "Romanist tract," tho we do recognize a spite against the Church of England in the caricature-clergyman, Dr. Nevington, a blatant and bloated mass of conceit. It is but the moving story of the appeal of goodness to all there may be left of the divine in a lost woman—just goodness, which redeems poor Poppy, as it has done and ever will do men and women worse than she.

Dissertations by Mr. Dooley. By Finley Peter Dunne. New York: Harper & Bros. $1.50.

It is astonishing that Mr. Dunne can turn out Dooley dissertations week after week for many years and yet keep them as a whole so full of wit and introduce such variety in spite of the sameness of their mechanical structure. Still there are days when Mr. Dooley's philosophy does not flow so clear and free from the tap as at others, and it is convenient to have his less evanescent disquisitions brought together occasionally in such volumes as this. His remarks on the labor question are always in order:

"It was diff'rent whin I was a young man, Hinnissy. In thim days Capital an' Labor were frindly, or Labor was. Capital was like a father to Labor, givin' it its board an' lodgin's. Nayether intherfered with th' other. Capital wint on capitalizin' an' Labor wint on laborin'. In thim goolden days a wurrukin' man was an honest artisan. That's what he was proud to be called. Th' week befure iliction he had his pitcher in th' funny pa-apers. He wore a square paper cap an' a leather apron, an' he had his ar-rm ar-round Capital, a rosy binivolint old guy with a plug-hat an' eyeglasses. They were goin' to th' polls together to vote f'r simple old Capital. Capital an' Labor walked ar-rm in ar-rm instead iv havin' both hands free, as at prisint.

"Nowadays 'tis far diff'rent. Th' unions has desthroyed all individjool effort. Year be year th' hours iv th' misguided wurrukin' man has been cut down, till now it takes a split-second watch to time him as he goes thru th' day's worruk. Well, it's too bad that th' goolden days has passed, Hinnissy. Capital still pats Labor on th' back, but on'y with an axe. Labor rayfuses to be threated as a frind. It wants to be threated as an inimy. It thinks it gets more that way. They ar-re still a happy fam'ly, but it's more like an English fam'ly. They don't speak. What do I think iv it all? Ah, sure, I don't know. I belong to th' onforchnit middle class. No wan iver sthrikes in sympathy with me."

"They ought to get together," said Hennessy.

"How cud they get anny closer together thin their prisint clinch?" asked Mr. Dooley. "They're so close together now that those that ar-re between thim ar-re crushed to death."

FINLEY PETER DUNNE.
(Mr. Dooley.)

Literary Notes.

....The great Episcopalian cathedral of St. John the Divine, which crowns Morningside Heights, in the City of New York, is described in the April *Scribner* by one of its architects, C. Grant LaFarge.

....*How Doth the Simple Spelling Bee*, by Owen Wister, is intended as a joke on the spelling reform movement. Altho we have been thru the book thoroly it must be confest that we can see neither rime nor reason in it. The author has mist his aim and is badly mixt in his ideas. [Macmillan. 50 cents.]

....The standard work of Professor James Mark Baldwin, on *Mental Development in the Child and the Race*, is issued in a third edition, ten years after its first appearance. The improvements and enlargements made for the translations into French and German now appear in the English form. [Macmillan. $2.25.]

....We have reviewed Professor Breasted's four admirable volumes, entitled *Ancient Records of Egypt*, including all historical docu

ments from the earliest times to the Persian Conquest. For the first time these records are thus compiled completely and translated into English for the use of the scholar. A fifth volume ($2.00) contains the indices, and is also issued by the University of Chicago Press.

....Professor McFadyen, of Knox College, Toronto, whose "Introduction to the Old Testament" has been commended in THE INDEPENDENT, has made a careful collection and study of *The Prayers of the Bible* [A. C. Armstrong & Son], which contains valuble devotional and liturgical material, together with discussions of the character and content of both Old and New Testament petitions.

....The vivacious author of "Success Among Nations" has reversed his opera-glass and now writes of *Success In Life*, of the individual man. Mr. Emil Reich is essentially French in his treatment of "success," which he defines as the attainment of the objects: "Health, Love, Honor, Power." "Wealth," as such, is not considered; a refreshing innovation, in treatises on success. (New York: Duffield & Co. $1.50.)

....Mr. Everard Bierer's treatise on *The Evolution of Religions*, while evidently written with good purpose, is amateurish in character, unreliable in statement of fact, incomplete in outlook, and disproportionate in consideration of the phenomena under discussion. The particular animus of the author is against the doctrine of the trinity, which assumes altogether too large a place in his survey of the development of religious doctrines. [Putnam.]

....How to combine the advantages of a large university with the peculiar benefits of the small college, is one of the problems of our higher education. Dr. Andrew Fleming West, dean of the Graduate School of Princeton, answers it in his book *American Liberal Education*, by the tutorial system now in force at Princeton, and he presents some good arguments in its favor, if the teachers and the taught are to know each other at all. [Scribner's. 75 cents.]

....Prof. F. Crawford Burkitt, of the University of Cambridge, delivered as his inaugural course as Norrisian Professor of Divinity ten lectures on the origin and historical trustworthiness of the Gospels, which were marked by critical acumen and clearness of presentation. As now published, under the title, *The Gospel History and Its Transmission*, the volume is one of the best in English on the sources of information concerning the life of Christ. [Scribner. $2.]

....Our young people ought not to go far astray, for lack of advice! Among the many books to tell them just what to do in various contingencies, Caroline A. Huling has written a series of *Letters of a Business Woman to Her Niece*, and the self-supporting girl who has any part in the business world is told from the vantage ground of twenty years' experience a good many things she will be happier for knowing. The advice is sensible, if trite. [New York. R. F. Fenno & Co. $1.]

REQUIESCAT.

"YOU'VE a bullfrog in your 'sophagus,"
'Twas thus the doctor joked.
The jest's on him, for Fred. from fear
Turned up his toes and croaked.
—*The Medical News.*

THE ADVENTURE OF THE BLACK, BLACK HAND.

HAPPY HOMES was pacing, nay trotting, convulsively up and down the room with his Latin, when I wafted in. Genially he gestured me athwart the window seat with his long graceful tibia, and cursed sublabially.

"I always was nervous," he lugubirated, indicating my garter, which had effused. Blushingly, I swallowed my gum.

"Speaking of neurasthenia," he guffled, tweaking away my cigarette with his usual charming *naïveté*, "I am reminded of the Adventure of the Black, Black Hand. One night last fall I could not get to sleep at all. I had been to the Yale Debating Union, and the sad memory of those highly unheard dead well-nigh convulsed my guesstronomics. I plunged into Jakes slaver, but alas! it was but leaping from the grave into the bier."

Stealthily Homes' long white finger stole toward a tiny bottle.

In alarm, I threw myself at him.

I missed him, and with a low, cruel laugh, he swallowed—the last jujube. He then drooled on—jujubilantly:

"It was now almost dawn, and I had not slept a wink. Within the room it was so quiet that the very water in my bottle was distilled. What a time for some burglarous fellow to make a break—in the door! A cold evanescence trickled from my tink-tank at the very tho't, and congealed crustaceously when I recalled that the door was not locked. In terror I fastened my eyes on the door, but the darn things kept rolling off. Suddenly a long, low whistle tremulosed right under my window.

I lay and auricled. A faint creak, the sound of something falling, and all was silence. With a perfectly horrid scream I elapsed, rampant, from bed, cranked the lamp up and then transundulated the room, stupified, shattered *eblouissé;* the worst had some; for lying lifeless across the threshold, white and ghastly in the pale dawn, I saw—Mong Du! a General Warning of our faculty for falling below my studies."

Homes buried his face. I dug it up.

"What of the Black, Black Hand," I hissed between his teeth.

"O, that?" he gurgled. "Don't you know the colored janitor brings the warnings?"—*Yale Record.*

Editorials

San Francisco and Harrisburg

Official investigation at San Francisco and Harrisburg laid bare, last week, shameful breaches of trust by public officers. Those at San Francisco were clearly criminal as well as shameful. And it is difficult to account for the expenditure of $9,000,000 in furnishing the new Capitol at Harrisburg unless we assume that a conspiracy hostile to the public interest existed there.

In the days immediately following the earthquake at San Francisco, men were shot in the ruins of the city for robbing the dead or stealing the property of stricken citizens who survived. The offenses for which punishment was then so summarily inflicted were no worse than those which have since been committed there by the men who were indicted last week and by their associates and instructors in municipal corruption. Are these also to be punished?

This is the question which must be answered as justice requires it to be answered if the government of American municipalities is to be delivered from corruption. Folk compelled the punishment of boodlers in St. Louis. Heney, another fearless, honest and vigorous prosecutor, intends to bring the rascals at San Francisco to justice. But no member of the ring in Philadelphia has suffered punishment, or is in danger of getting his deserts, and no part of the public money stolen there has been recovered.

It is necessary that those who are most guilty should suffer under the law. In many instances these scoundrels escape not only punishment, but even prosecution. Seventeen of the eighteen San Francisco Supervisors have confessed their guilt and told the whole story of their treachery. For two reasons Heney has not asked for the indictment of these men: First, because he needed their testimony for use in the pursuit of greater rascals, and could get it only by making some concessions; second, because the prosecution of them might prevent a successful prosecution of those by whom they were corrupted. He seeks to convict Mayor Schmitz, Boss Ruef, and, above all, the capitalists and officers of powerful corporations who bought Ruef and Schmitz and hired them to buy the Supervisors.

Of course, these Supervisors are guilty. They admit it. They will be punished by the contempt of honest men as long as they live. But is the guilt of these clerks, and blacksmiths, and hack drivers, and carpenters and the like as great as that of the educated and well-to-do men who tempted and bought them? Ruef is a graduate of the University of California and a member of the bar. And the officers of the railroad and gas and telephone companies who bargained with Ruef or who sought the favor of the Supervisors by direct payments to them have sinned grievously against society as well as against the law. Undoubtedly, Heney would like to punish every man who is guilty, but he must choose, and he ought not to let the rich corrupter escape.

There is a lesson in this great scandal for organized labor. The unions have perfected a labor monopoly in San Francisco. With monopoly has come demoralization. There is proof of this in the labor methods adopted since the earthquake and in the condition of the labor market. And political power has come into the hands of those unable to use it intelligently. The workingmen have been induced to submit to unworthy and dishonest leaders. Ruef was not originally one of them, but Schmitz, a weak and incompetent man, fell under Ruef's control. An honest workingman of strong character in Schmitz's place would have prevented corruption and elevated the union cause. But Schmitz, under Ruef's guidance, has become organized labor's worst enemy.

To the opponents of unionism he has given an almost inexhaustible supply of ammunition. They are using it in the Old World as well as in America. The unions of the United States should formally denounce those who have betrayed their cause in San Francisco, and should hereafter select their representatives with

the greatest care. Organized labor in California suffers now by ridicule as well as by the criminal offenses of its leaders in politics, for it was Schmitz, the Labor Mayor, and those whom he represented, who professed to fear that their children would be demoralized or contaminated by association with a few little Japanese in the public schools!

No question as to the influence of labor unions in politics is raised in connection with the revelations at Harrisburg. Those responsible for the waste, or worse, of millions there appear to have been the highest officers of the State, elected or appointed as representatives of the Republican party. For the new capitol $4,000,000 was appropriated, and the building appears to have been erected at a cost not exceeding that sum; but for furnishing it $9,000,000 was spent, and the testimony indicates that about $6,000,000 of this was profit for contractors or other persons. Nearly all the work was done by one contractor, who has already received more than $5,000,000. Proposals for the furnishing were invited by advertisements which said that separate bids for the several kinds of supplies, such as chairs, chandeliers, carpets, etc., might be submitted. But a curious resolution offered by Governor Pennypacker was adopted in the Board of Public Buildings, and this resolution barred out any bid which should not cover all the furnishings. It appears that only one bidder (the successful one) knew of this requirement. His bid covered all the work, and he got the contract. Then he sublet the work to various persons.

His profit has been enormous, owing partly to the curious and extraordinary character of the specifications. He paid a subcontractor $2,060 for two rostrums, and received $90,748 for them from the State. For painting which an unsuccessful bidder had offered to do for $164,473, he received $789,743. The State paid him more than $2,000,000 for chandeliers. Under the specifications he was paid for them by the pound! They are extremely heavy, so ponderous, in fact, that the investigating committee has been told they are in danger of falling by their own weight. Telephone booths at from $3,000 to $4,000 apiece are among the furnishings. Official figures show that the contractor's profit on the subcontracts ranged from 300 to 4,000 per cent.

Responsibility for the official action which permitted such payments for this work and paved the way for them by means of unusual and remarkable specifications should be clearly fixed by the investigating committee. It is admitted that Governor Pennypacker was the author of the restrictive resolution of which we have spoken; unsuccessful bidders have testified that in answer to their inquiries he told them that separate bids for the various kinds of furnishings were invited and could safely be made. There should be an explanation of the haste with which about $4,000,000 was paid out after the election of the Reform Treasurer, Mr. Berry, and before he could assume office.

If there was a conspiracy to rob the State, the people of Pennsylvania should insist on the exposure and punishment of the conspirators. The higher the station of the guilty, if guilt there be, the more important it is for the public welfare that they should not escape.

A Stage in Church Union

It was a comparatively easy thing for the Northern Presbyterians and the Cumberland Presbyterians to unite into one body, for their Presbyterian name was the same, and the smaller body was the daughter of the larger. Equally a generation ago it was easy for the Old School and the New School Presbyterians to unite, for there was no difference between them, and a generation earlier they had been one. In both these cases they had precisely the same polity, and the softening of the theology of the stiffer body had made it almost impossible that they should not fuse together. There was no visible distinction between them.

It is not so with the approaching union of the Congregationalists, the United Brethren and the Methodist Protestants. While there is a common bond of the love of liberty between them and there is no special difference in their theology, yet their polity is by no means the same, and there had been no his-

torical relation between them, and they hardly knew each other. The Congregationalists began their ecclesiastical life in Plymouth and Boston, and spread west from New England along the northern tier of States. The United Brethren broke off from the German Reformed Church a hundred years ago, and the Methodist Protestants from the Methodist Episcopal Church seventy-five years ago, and their success has been in the Middle States. Their Church government has been a complex of the Presbyterian and the Methodist, quite diverse from the Congregational. And yet these three bodies are making a grand attempt to unite, and a further most hopeful stage was reached in the meeting of their appointed delegates in Chicago last week.

The negotiations between these three denominations began in 1903, when the proposition looked so hopeful that the project was referred to their national bodies for approval. Each approved and appointed a large representative body of delegates to prepare a plan of union. They met in February of last year, and agreed in a common statement of their religious belief and in a general form of government, which was something of a compromise and quite elastic. They agreed that it was not impossible to join their vested interests, their benevolent, educational and publishing work. Yet these conclusions were not regarded as complete, and large committees of the three bodies met again last November, and still further advanced their work and published their plans. These were carefully considered and much discussed, and the full delegations met last week to act upon them and report once more to their national bodies.

But meanwhile a considerable opposition had grown up among the United Brethren, and their chief organ, *The Religious Telescope,* had argued that it was not wise to proceed on the basis proposed, as it yielded what was vital to the body. Thus the delegates met with serious apprehension that the United Brethren would withdraw. The conference continued two days. The difficulties were presented with great frankness. They concerned in part the safeguarding of the property interests of the Church, especially the United Brethren's large publishing house in Dayton, O., which must not be endangered; and equally the greatly valued connectional system of supplying churches with pastors. After the fullest discussion, and after an entire recasting of the plan of polity, making it still more elastic, all parties came to a unanimous and favorable conclusion. For this they were largely indebted to the able assistance of the Methodist Protestants, in the matter of polity, while the law committee guarded vested interests with great care.

It was agreed that where it was desired a present State conference, as now composed, might after union maintain its separate indefinite existence. That would allow the Congregationalists in New England, where the other denominations are not found, to go on precisely as they are, and, equally, a United Brethren conference in Pennsylvania, where there are almost no Congregationalists, would not have to modify its connectionalism, while both would be members of the same National Council. This is as it should be, for union can never take place except on the basis of liberty with abundant privilege of differing. But it must not be supposed that this means a federation. It will be a full corporate union—under the same National Council, but with somewhat different ways of doing things in different localities, just as the States in our Union each make their separate laws. We have federation already in the National Federation of Churches and Christian Workers, and there is no plan for a second sort of federation between these three denominations, but for absolute corporate union, with one National Council, and the same benevolent societies, and the State and local conferences consolidated as fast as may be convenient. Nothing less will give what is desired. It is less machinery, not more, that is sought, a closer union of hearts and forces.

One other thing calls, not for present criticism, but for regret. The name agreed upon was accepted under stress from the law committee, and it is far from ideal, and it can be only temporary, to continue while the process of union is being accomplished. It is "The

United Churches; comprising the Congregational Churches, the United Brethren in Christ and the Methodist Protestant Church." The lawyers insisted that the full title of all the three bodies should go into the legal corporate name while the transfers of property were being made. Of course, such a name is impossible permanently. The designation usually used would be the United Church, or Churches, as we speak of the United States; and possibly —who knows?—the members might speak of themselves as Unionists. Of course, this long name will have to be dropt whenever any other body comes into the union, and then we may have the United Church of Christ, or the Union Church of Christ, for that wide inclusion is what we all want at last to secure.

Readers must not expect this promised union of these three bodies to be consummated this year. These things take time. The Congregationalists will meet in National Council next October, and the other two bodies not till a year later. If they approve—and we believe they will—there is no reason why the Union should not then be speedily completed by the organization of a common National Council. Foreign mission boards and some others can be readily consolidated. Others may take longer time. But it is well that what is well done should be done quickly. Those who have thus met in council have learned to love and honor each other, and to feel assured of mutual fraternal fellowship in common service.

The Benefits of Cramming

THERE is an old conundrum that we have forgotten, but we remember the answer, which is: "One is training for a run and the other is running for a train." Considered critically, this is seen to be a distinction without a difference.

Guessing the conundrum from its answer, the practising sprinter is really doing the same thing as the belated suburbanite. He may say and even think that he pounds the cinder path for weeks in order to dash by the grand stand in a tenth of a second less than some other fellow, but in that he is mistaken. In reality the silver cup, the rooting crowds and the rival teams exist simply for the purpose of inducing him to give daily training to his own muscles. He could earn enough money to buy the silver cup if he had put in as much time and energy at some gainful occupation.

A confusion of thought similar to that betrayed by this classic conundrum prevails in regard to our examination system. Ask the student why he spends his spring days in such unusual assiduity, and he will answer that he is cramming for examination, and, if you inquire what is the object of examinations, he will explain that the instructor gives them for the purpose of finding out how much a student knows. This is a great mistake. An instructor, if he has not too many students in his classes, knows better than they can tell him how much they know of his subject. It may be betraying faculty secrets, but we have heard of instructors, in a hurry to get in their reports, make out their term cards duly graded A, B, C and D before examination, and yet they did not often have to send in a correction to the registrar. Really examinations exist for the purpose of training students in intellectual sprinting.

The ability to rise to an emergency the power of applying all one's resources in a sudden crisis, is one of the most important factors of success in life, and. like other talents, it is within certain limits capable of development by training. In assuming new lines of work, in adding another business department, in taking up a new case, in adapting oneself to changed conditions, one has to go thru a period of concentrated acquisitive activity very much like the student's cram. If school is designed to be a preparation for life, as some educators think it is, it should include an equivalent of crisis practice. Cramming may be defined as acquiring the ready use of a large amount of information in a short time. The only legitimate objection to it is that it may be employed as a substitute for daily diligence. Where this can be done however, it is largely the fault of the form of the examination. It is wrongly used to measure mere quantity of information, to test memory instead of ability. The classroom mark or the frequent and

regular quizzes should show whether the student has been thru the process which is regarded as necessary for the accomplishment of the object of the course. The examination at the end is to show how much the student has profited by it; to find out what a man knows at present, not what he has known at some time in his course. The world is interested in what a man can do; it cares nothing for what he has done. The reason why the world is reluctant to take a college diploma at its face value is because its Latin is mostly in the preterite, if not the pluperfect tense. You cannot grind with the water that is passed. The examination should not measure the current, but the head of water, the stored and available power.

It is not necessary to decide which is the better man, the plodder or the sprinter. The able man will be both. He will have acquired both steadiness and readiness. He will have the patience and persistence to perform his ordinary daily tasks, and he will also be able to steam up quickly and work under high pressure whenever necessary. The boilers of steam engines are tested for strength as well as capacity.

The final hurried review of a subject for the purpose of grasping its salient points is of very great educational value if anything like adequate foundations have been previously laid. It often unifies the subject as nothing else can. The common statement that what is learned in this way is soon forgotten, contains about as much falsehood as truth. Let the reader consult his own experience. He will probably find among the knowledge imbedded most deeply in his memory some fragments snatched from a book just before entering the examination room. Then, if ever, the brain is aroused to the most efficient use of its apperceptive powers. Education becomes purposive, and under these conditions more can be accomplished in a short space of time than in the ordinary dull routine. One can often remember in after years the questions of an important examination and how he answered them, altho he cannot recall so many of his classroom recitations. A great emotional crisis, like the danger of drowning, will revive with remarkable vividness and detail the events of one's life, and in the excitement of an examination a similar effect is sometimes observed; the knowledge gained in a course of study is concentrated and brought into the mind at once, making a strong and durable impression. There is, then, educative value in the examination itself and in the preliminary process of study under forced draft, but the latter is the more important. To get the benefit of it the student must both know when the examination is coming and realize that much depends on it. Unexpected and unimportant examinations are of little benefit to the student because there is no opportunity for cramming.

More About John Brown

In our issue of March 7th we published an article by Joel Clark Rockwell, who purported to give the story of how he, belonging to a Missourian company, made a raid into Kansas in the Border Ruffian times and "captured John Brown," March 7th, 1857. It was a good story, well told, and now we have the anticipated corrections and denials.

August Bondi, Esq., of Salina, Kan., is the only survivor of John Brown's band, or company, who with John Brown made the campaign of 1856 from Black Jack to Osawatomie. He and Luke I. Parsons are the only survivors of John Brown's company at the Osawatomie engagement, August 30th, 1856. For his authority he refers to the archives of the Kansas Historical Society. He says:

> John Brown's sons and son-in-law could not have been with him when he is said to have been captured in 1857. All of John Brown's sons and his son-in-law, Henry Thompson, with the exception of Jason Brown, left Kansas about July 15, 1856; Jason Brown left November, 1856, and none of them *ever* returned to Kansas. And Capt. John Brown had left Kansas sometime in October, 1856, and did not return till very late in 1857, very near New Year's, 1858.
>
> Rockwell is likely correct in his story about liberating some suspects from St. Joseph jail, but most incorrect in the story of their capture. Some fifty border ruffians crossed the Missouri and picked up three men, claimed to be suspected of running off Missouri negroes, and some fifteen young chaps went from Lawrence and liberated the three, as the tale goes, about as Rockwell says: "John Brown" was their password. I believe this happened just

a week or two before the border ruffian invasion of Southern Kansas (Linn and Bourbon counties), in November, 1857. John Brown was not in Kansas at the time; might have possibly never returned but for that invasion and subsequent border ruffian raids.

Another communication which throws light on the subject is from James G. Stewart, M.D., of Biggsville, Ill. He was practising medicine at Elwood, Kan,. just across the river from St. Joseph, at the time of this reported occurrence. At that time it was the custom to charge any startling events to the agency of either John Brown or Jim Lane, and this, he believes, accounts for the error of Mr. Rockwell. He says:

My impression is that the man Mr. Rockwell had a hand in capturing, who was "stealing darkies" and had "only one pistol for himself and sixteen men in Kansas in 1857, was not John Brown. Mr. Rockwell's account of Brown's liberation from the St. Joseph county jail, however, suggests the basis of the story.

Dr. John Day was a prisoner held for trial at Platt City, Mo., on a charge of stealing negroes. When the Territorial Legislature of Kansas heard of this it sent ex-Gov. Wilson Shannon to defend him. He secured a change of venue for Day to the court of St. Joseph, where the trial proceeded. Day had been captured in Kansas and proved that he had never been in Missouri before his capture, but the jury hung, eleven to one in favor of acquittal. He was guilty of forwarding fugitives, however, and the second trial, which seemed to us a mockery of justice, awarded him a five years' sentence in the penitentiary. He was to be taken, on Monday morning, to the State prison, but a party of free-State men, from Elwood, went over Saturday night and rescued him. Twelve of us acted as a guard in front of the jail. Joseph Gardner and two men, named respectively, Souler and Goelet, went to the jailer and representing one of their number as a horsethief secured admission to the inside. I do not remember which one played thief. He was not ironed, but had his hands apparently tied by the string of a slung shot. Gardner was a man of great physical power, six feet four in height. He had a knife that was neither a dirk nor a corn knife, but about halfway between the two. He drew this and told the jailer that he wanted John Day. Day was produced at once and we made good use of a very dark night to get him across the river. I went with the party fifteen miles to show the road.

This is the true account of the rescue of John Day. Albert D. Richardson, in "Beyond the Mississippi," says that John Brown made this rescue, but this is an error, as Brown was not in the party.

It is plain that Mr. Rockwell had in mind this rescue of Dr. Day. Our correspondent, Dr. Stewart, lived during the four years previous to January, 1861, a half-mile from St. Joseph, and he never heard of John Brown being imprisoned there. In fact, John Brown held such a place in the sentiments of the Free State people of Kansas that he could not have been detained there without bloodshed and without the presence of Federal troops. We fully trust these competent witnesses, the latter of whom tells us that he has been a subscriber for THE INDEPENDENT for twenty years.

Suburban Cottages Versus Flats

EVERY reaction from social or business laxity finds its finality in improved homes. It always has been so, and it always will be. The beautiful home, wisely constructed, is the most perfect thing on earth. Congested population has been working disastrously, and has steadily toned down the average quality of home life. Children are begotten in the crowded city, under disadvantages that no municipal provisions can compensate. Schools have to deal with a predestined element. Street life is a distinct feature of crowded population, and club life is hardly one grade more satisfactory. It was this dissatisfaction with home life, and its surroundings, that finally exalted the flat as a haven for tired men and jaded women. Congested life could think out nothing better. But flat builders now tell us that another reaction is going on, and that it has gained much headway.

Indeed flat building really was only a tentative expression of dissatisfaction with the conditions of city life. It was tried as a relief, and it has been found wanting. In fact, flat life is not home life, for home life is strongly individuated, and to some extent constitutes a unit by itself. Meanwhile the tide which set in countryward is moving with accelerated activity. The middle classes especially desire less publicity and more retreat. The consciousness of contiguity is always an annoyance; perhaps worst of all is the fact that each flat creates an atmosphere of its own, and any occupant must either partake of this atmospheric existence or be an alien. The unlimited output of country home books has been influential in awakening an ambition to reconstruct

the home where the birds may sing and the leaves may whisper and the brooks may gurgle. It is very hard work to root out of human nature a longing for handfuls of violets and goldenrods, for beech nuts and daisies. We are too close akin, we of the animal world, to the vegetable life to tamely submit to a life without roses and gardens and orchard trees.

Suburbanism is growing in popularity everywhere. This is manifest from the Atlantic to the Pacific, for the people are pushing out for homes wherever the trolley can reach them, with sufficient readiness to keep them in close association with business life. "Suburban cottages are now the demand," and for a while at least this sort of houses and homes is sure to control the market. The word suburbanism means at the present day something a good deal larger than it indicated twenty-five years ago. It takes in something more than the suburbs. It goes out with the electric car, from five to twenty-five miles, or even more from dense population. You can now find, nestling among the hills or lining the creeks with their residences, thousands of city people. Most of these own from one to ten or even twenty acres of land. There is more or less of garden work and considerable orchard planting. Most of these homes are quite up to date as to windbreaks and hedges and shrubbery. They are well drained and are well kept. They seldom show the carelessness about litter and brush that is seen about old farmhouses. While they are not free from a certain amount of city instincts, that they have brought with them, they are learning how to be natural and simple.

This suburbanism, naturally, is being made use of by those with fresh and untried ideas of a social sort. Just now groups of homes are being constructed, with a certain amount of social unity and a co-operative industrialism. Each home contributes to the common welfare, not perhaps in a different way, but in a different degree, from old-fashioned communities. How to find out the wisest mean between isolation and congestion is a large problem. It will bear a good deal of thought and experimentation before it is solved. It does not follow that every country resident shall grow all his own fruit and vegetables or do all his own housework. There is much ahead along this line to be found out; how most perfectly we can enjoy the pure air, the birds, and the breeze, and the roses, and the apples, and at the same time can best share both the burdens and the pleasures with our neighbors. The Garden City Association of Great Britain has undertaken the founding of cities, on the suburban principle, while men of small means may have attractive homes with their own gardens. This movement has been repeated by an association of the same nature in the United States. It undertakes to foment a taste for country life among average city people with average or small incomes. In these garden cities such people will find opportunity for cultivating a considerable amount of their own food, as well as caring for a cow and a horse. What has proved to be a movement of considerable importance in Europe will likely be equally important here. It is not an idle dream that every man may live where he can enjoy his own orchard and garden and gather from them his pleasure as well as comfort.

Senator Spooner's Successor

An interesting contest is under way in the Wisconsin Legislature, precipitated by the unexpected and regretted resignation of Senator Spooner. It is not to be expected that the Legislature can find a successor equal in the eye of the nation at large to either of the two Senators who now represent that State.

The political revolution within the Republican party of the State during the past eight years, which the public associates with the name of Senator La Follette, has brought about as remarkable a series of progressive legislation as is known to the American people. The laws enacted have been remarkable, not merely in the fact that they have dethroned the corporations and their political manipulators from the government of the State, but also in the thoroly constitutional and effective way in which they have done it. The anti-pass, direct pri-

maries and civil service reform laws strike at the root of corporate and political influence. Even United States Senators are nominated by the people without the intervention of party conventions, altho this law does not apply in filling a vacancy such as the one created by Senator Spooner's resignation. The taxation of railroads and the inheritance tax have been brought about by laws which are models for other States. The regulation of railroad and interurban street car fares and rates has been worked out on a basis much superior to that of the amended Federal law, and points the way to future amendments of the latter. This series of legislation is being followed up during the present session of the Legislature by bills looking to a similar and even more effective regulation of all public utility corporations, as well as the preservation of the great developing water power of the State from the control of private exploiters.

The Legislature which is considering these questions, and which will elect the Senator for the unexpired term of two years, is the first elected thru the direct primaries, and is overwhelmingly in accord with the policies adopted under the leadership of Senator La Follette. Of the 133 members on joint ballot the Democrats and Social Democrats have 28, and these will cast complimentary votes. Of the 105 Republicans who will nominate the Senator in caucus, about 80 are counted with the Progressive wing—or, rather, the Progressive body—of the party. All of the candidates, announced or unannounced, are more or less affiliated with that wing. The only avowed candidate who is considered to have "Stalwart" leanings is Congressman Esch, of the famed "Townsend-Esch" railway bill. His reputation in this direction follows his support at the last election of Congressman Babcock, who has been relentlessly opposed by the Progressives. The present Governor of the State, James A. Davidson, altho supporting the Progressive policies, was opposed in the primaries by Senator La Follette and was aided by Stalwart votes. He is looked upon as a dark horse, available in case the Progressives hopelessly split on their choice.

The candidate who starts with the largest following is the former Speaker of the House, Irvine L. Lenroot. He was Senator La Follette's avowed and earnestly supported candidate before the primaries in opposition to Governor Davidson, but was defeated by 50,000 votes. It is a most interesting commentary on the independence of the Wisconsin Republicans, that, while they were nominating an overwhelming La Follette Legislature, they turned down the candidate for Governor whom the Senator most eagerly and tirelessly pressed upon them. It is thought that this experience will incline him to keep out of the Senatorial contest.

The most picturesque and perhaps the most deserving candidate, from the standpoint of party service, is the aged but vigorous lumber millionaire, Isaac Stephenson. Mr. Stephenson was a member of Congress during three terms some twenty years ago and was the active associate of the able group of Stalwart politicians, of whom Senator Spooner is the last. He was a candidate for the Senate at the time when Senator Quarles was elected, but since that time he has supported La Follette during the period when the Progressives most needed the financial support which they had forfeited thru their antagonism to the corporations. He supplied them with an aggressive daily paper which they needed most of all, and his claims on their gratitude are unquestioned. He has announced that he desires only the two years' vacancy and will make way at the regular election for the younger Progressives who had expected to come forward then.

Congressman H. A. Cooper, of Racine, the chairman of the House Committee on Insular Affairs and one of the strongest men in the Wisconsin delegation, has been a member of Congress twelve years and has been identified with the Progressive wing since the time when they were thrown out of the National Convention at Chicago in 1904. One of his Congressional laurels is the defeat of the Union Pacific refunding bill in 1897, which is estimated to have saved the Government $125,000,000.

State Senator W. H. Hatten has been identified directly with the actual framing of the laws which have marked the new Republicanism of Wisconsin. To his unusual abilities as a committeeman is due the fact that these measures were

steered thru the Upper House. Most remarkable of all was the feat of bringing over the hostile members of the Transportation Committee so that without sacrificing their principles they reported back unanimously the railway-rate bill which now places Wisconsin in the lead of railway regulation. He has shown himself one of the most effective of the co-workers of Senator La Follette, supplementing his aggressiveness by the conciliating reasonableness of the principles that both are contending for.

It is clear that with such candidates as these Wisconsin might well take the lead in framing National, as it has taken the lead in State legislation.

An "Arbitrary" President

That able journal in this city which "shines for all" devotes a good part of its misapplied intelligence to asserting, or more often implying, that President Roosevelt is a sort of tyrant who has "monopolized" in his "salient and abounding personality most of the powers distributed in the Constitution." It says this week:

"If poor old George III could revisit the glimpses of the moon how he would sputter 'What, what, what!' to find the descendants of the men who revolted from his personal and arbitrary rule accepting with enthusiastic gratitude a personal ruler who takes all regulation for his province and imposes his curious temperament and his commanding and restless volitions upon all functions of government and most matters of human interest."

Such language as this may have its purpose in opposing President Roosevelt's influence as to the control of railroads, but it is absolutely devoid of justification in fact. Let it be remembered that while the office of the President is executive under the Constitution, it is also legislative. The President must not only advise Congress, but his consent is necessary to the validity of an act of Congress. In his action there is nothing "arbitrary," nothing "imposed," and Congress is at full liberty to refuse his recommendations and has done it many times.

To Retain the Philippines

There has been of late a tendency, even among Republicans as well as Democrats and the intolerant and intolerable anti-imperialists, to play with the idea of pretty soon giving up the Philippines, perhaps to Aguinaldo, perhaps to Japan, or in some way to wash our hands of the difficult responsibility. It is of consequence to listen to the report of Archbishop Harty, who is now at the head of the entire Catholic Church of the Islands, and who is an American. He is now in this country for a brief visit, and he declares that American government has greatly improved the primary school system, and has done much to impress on the people the dignity of labor. As to abandonment of the islands, he expressed himself in the most positive terms:

"Most decidedly not. It would be a burning disgrace. Yes, disgrace. I want to use that word. It would be a shame. Give me permission to state also as my decided opinion that the brightest page in American history will be that recording the operations of this Government in the Philippines. My belief is that in time the Filipinos may turn Japan to Christianity. These Philippines are the pearl of the Orient. Just think—six million Christians in, we may say, the heart of Asia! Yes, and I do not feel I am optimistic; I believe that the Filipinos will finally convert the Japanese, and the Japanese will, in due time, convert Asia!"

To abandon the islands would, he says, give it to professional revolutionists. The best elements, he assures us, respect and admire the United States, and he speaks well of the administration of Gen. Leonard Wood, and the civil government as well.

Battleship Explosions

Two battleships, the Japanese "Mikasa" and the French "Jena," have now certainly been blown up by their own explosives, and, oddly enough, in their own dockyards. The "Mikasa" was alongside a wharf and the "Jena" was entirely out of the water and in an empty dry dock. In fact, in order to admit water to flood such magazines as were still intact and so to prevent the fearful destruction of adjacent buildings which would have followed, another ship had to batter down the closed dock gates with a shell from a big gun. Nine years ago our own "Maine" blew up in Havana Harbor, and while it is a sort of national tenet that she was the victim of a submarine mine purposely placed for her destruction, the belief has steadily increased of late (and is helped by the stubborn refusal of the Govern-

ment to get her where she can be looked at) that the real agents were her own black powder and poor coal. In the "Jena" 118 men were killed and over 250 in the "Maine." How many the Japanese lost in the "Mikasa" they keep to themselves, but otherwise they are not so secretive. When the "Mikasa" was raised they found chemical deterioration and consequent alteration of her smokeless powder quite sufficient to account for its spontaneous explosion, so that the "Jena" tragedy, now shown to have resulted from the same cause, only goes to increase the anxiety with which, in all navies, the new and powerful explosives are already regarded. No ship probably ever survived the blowing up of a magazine, and whether the vessel be made of wood or of steel that casualty may be considered as necessarily fatal; but the subsequent fierce burning of the "Jena," supposed to contain the minimum of combustible material, is almost as much of a surprise, as was the overwhelming of the Russial "Orel" at the battle of Tsushima by projectiles which hit only her superstructure and left her power of flotation unimpaired. If battleships supposed to be unburnable nevertheless do burn, and battleships supposed to be untakable if not hurt below the water line, nevertheless are put *hors de combat* by slaughter of their crew in the unarmored superstructure, and if, despite all modern improvements in the making, handling and storage of explosives, their magazines have a way of peacefully blowing up and killing hundreds of men at a time (the enemy during the Spanish War killed but one man in our navy), the question of just why we should go on building them at $10,000,000 each, unless self-extermination is what we are after, bids fair to become even more pointed than it is now. Meanwhile it is reported that the big and much celebrated "Dreadnaught" is proving desperately hot in her turbine engine-room, and that her great size has so reduced her maneuvering capacity at low speeds as simply to put her out of squadron formations with smaller and handier vessels; a result which already confirms some of the predictions of the anti-big ship party.

Coolies

It is not the better class of our Pacific Coast population that is so hostile to the Japanese laborers, or who would shut them out from our country. They suffer from the term *coolie* applied to those who come as contract laborers. This class has been long enough in Hawaii to show of what stuff they are made. A Hawaiian paper says that two of the largest wholesale Japanese establishments in Honolulu are run by men who came there as "coolies." In fact, outside of the banks and some five large mercantile houses which are branches of Japanese firms, practically all the large and small business concerns are captained by ex-"coolies." Outside of Honolulu all over the islands one meets with prosperous Jananese shopkeepers, nearly all of whom came over as contract or other laborers. We fail to see why their condition is any less respectable than was that of two or three able anti-imperialists, to play with the men we might mention who have become Presidents of the United States, and some of these ambitious "coolies" are likely to rise to the highest positions in their own country.

By a Census bulletin the population of the Continental United States has increased more than six and a half millions since the Census of 1900, or 8.7 per cent. The total population is computed at 83,941,510 for 1906, while if we include our insular possessions the total will be 93,182,240. That means that when the next national Census comes in 1910 we shall run very close to a hundred millions of people. During the years from 1900 to 1906 eleven cities have risen to the population of 50,000, of which it is pleasant to see that three, Norfolk, Va., and Dallas and Houston, Tex., are in the South. The densest population is in the States of Rhode Island, Massachusetts, New Jersey and Connecticut, and in that order, with New York, Pennsylvania, Maryland and Ohio following behind. But a census of Ohio's Presidential candidates would have put it ahead.

A startling telegram came some months ago from India that Dr. Lecoq had brought some remarkable ancient

manuscripts from Turkestan which contained a new language and were likely to be as revolutionary as the decipherment of the Cuneiform inscriptions by Sir Henry C. Rawlinson. To that announcement we gave little credit. It is now reported that Professor Müller has found the language to be that of Sogdiana, a province of ancient Persia, and the fragments to belong to a hitherto unknown version of the New Testament. He says it differs from other versions and its source is not known. It may have been made by one of those Nestorian missionary parties that went even to China, perhaps from one of the Syriac versions, or from the Syriac Diatessaron. We shall doubtless know soon.

Beyond all question the reform wave in China, which rose so high last year, has receded, and the reformers are being shorn of their power, and the advance of Western education has gone backward with the success of the conservatives. Whether the yielding of the Court to this latter movement is sincere is by no means settled in the minds of careful observers on the ground. It would hardly seem possible that so soon China should have forgotten two such lessons as the overthrow of the Boxers, involving the capture of Peking and the flight of the Empress, and the victory of Japan over Russia. Now the terrible famine will give opportunity for another Boxer-like insurrection, which may endanger the life of all foreigners and delay the reorganization of China after the Japanese pattern.

Those of our readers who are interested in excavation and research in Egypt, and would like to take some part in it and receive the annual publications, will be pleased to know that Professor Petrie, who has been so extraordinarily successful in this work for a dozen years, who opened up the main sources of the papyri in the Fayûm and Oxyrhynchus, is to be employed entirely by the Egyptian Research Account, a society organized a few months ago, and which will, under Dr. William C. Winslow, of Boston, have the support of American subscribers. We heartily commend it, regretting the difficulties which interrupted the previous work and made the change necessary.

We shed no tears over the report that the faculty of the Yale Divinity School proposes to drop Hebrew as a required study and substitute for it courses in science. There is no fear that so valuable a study as Hebrew, the key to all the Semitic languages, will be given up, but it would, if the plan be adopted, make Hebrew elective, like Arabic or Assyrian, to be chosen by theological or other university students as their tastes might lead them. Hebrew is no special advantage to most ministers, and they forget it as soon as they can.

Doubtless Pobiedosteff, Procurator of the Russian Church, and a chief adviser to the late Czar in everything bad and tyrannous, was as honest as bigots can be. Nevertheless he was a chief curse to his country, and his death relieves it of a sore burden. He lived long enough to see his advice bear fruit in war in which Russia was humiliated before a nation she despised, and in an uprising of the people whose complaints he would never hear. And this man represented to Russia the Church of Jesus Christ.

Theodore Roosevelt is spoken of as a young man, only forty-six years old when elected President. But Grover Cleveland was another young man, forty-seven years old when elected to the same office twenty-three years ago. He has celebrated his seventieth birthday during the past week, and we add our congratulations and our honor, for his period of retirement has been one of dignity and usefulness. His personal character adds to his official distinction.

Ought we to give up meat? That course seems suggested by the investigations of Prof. Irving Fisher, of Yale University, who has been pitting flesh-eaters against vegetarians, and he finds that the latter have much greater power of endurance in all physical tests.

In Missouri last week the "unwritten law" was again successful in routing the written law in the case of a man who was acquitted after having killed a man who was charged with having insulted his wife. What is the use of having any written law at all?

Insurance

Pernicious Insurance Legislation

We called attention to the recommendations of Governor Folk to the Missouri Legislature in our issue of March 7. One of these recommendations had in contemplation the compulsory investment within that State of not less than 70 per cent. of the premiums received by insurance companies from Missouri policy-holders. Following closely in the footsteps of her sister State, Texas now has a legislative bill pending of similar import by means of which insurance companies doing business in Texas in the event of its passage, will be required to invest at least 75 per cent. of the reserve set apart for the final payment of Texas policies in Texas securities and in office buildings in the cities of Texas and so on.

If the legislation of Missouri and Texas is followed by the enactment of laws making State investments obligatory and all the States proceed along similar lines, the funds of the various insurance companies would have a remarkably wide geographical distribution, it is true. Not all of the insurance companies' eggs would be in one basket, but the financial expediency of such investments may well be questioned by conservative financiers. No argument is needed to show the difficulty and inconvenient delay in realizing quickly in times of financial stringency. Mr. Cleveland's well considered brief, submitted by him to the Tennessee Assembly committee, was opportune as showing the vital danger of unwise legislation toward which we are tending.

The American Snuff Company of this city has formulated a plan of insurance whereby any of its employees who has been in the service of the company for one year or more may devise a sum not exceeding $500 to a designated heir. The text of the circular follows:

> Upon proof of the death, before July 1st, 1907, of any person in the employment of this company at the time of his or her death, who shall have been continuously in the employment of this company for at least one year preceding his or her death, and whose wages do not, at the date of his or her death, exceed fifty dollars per week, the American Snuff Company will donate, in cash to the person finally designated by such employee a sum of money equal to the wages paid to such dead employee by this company during the last year of his or her life, not exceeding, however, in any case, the sum of five hundred dollars ($500).
>
> Any employee desiring to avail himself or herself of this bounty must give to the cashier of this department the name of the person selected to receive it; and such selection may be changed by the employee at pleasure by notice to the cashier.
>
> The donation hereunder will be made only upon satisfactory proof of death made to our New York office within sixty days after the death of such employee, and will be made only to the person finally designated and not to the heirs, executor, administrator, creditors or assigns of such person.

The Metropolitan Life Insurance Company has just announced that every person insured in that company under a whole life industrial policy who is now seventy-five years of age or over is relieved of further payment of weekly premiums. This concession also applies to policy-holders of the class specified who attain the age of seventy-five during 1907 as soon as the age is attained.

The Presbyterian Ministers' Fund, which was chartered in 1759 and is the oldest life insurance company in the United States, adopted a resolution at its one hundred and forty-eighth annual meeting, held at the company's home office in the Commonwealth Building, Twelfth and Chestnut streets, Philadelphia, Pa., that the lives of all evangelical ministers would be insured. This company, of which Perry S. Allen is secretary, has heretofore only insured Presbyterian clergymen.

The Hartford Steam Boiler Inspection and Insurance Company has just acquired a substantial control of the stock of the Boiler Inspection and Insurance Company of Canada. The Canadian company has a perpetual charter, with broad powers, direct from the Dominion Parliament, and was incorporated and began business in 1875, making a specialty of steam boiler inspection and insurance business. The control of this Canadian company will add much to the magnitude of the Hartford company's business.

Financial

The Stock Market

At the end of last week, quotations on the Stock Exchange showed a further decline, ranging all the way from 2 to 16 points, but at the low closing figures of Saturday the prices of nearly all securities were considerably above the lowest of the panicky market of the 14th. No financial failures were announced; general business continued to be good; bankers in the interior of the country were undisturbed. Changes for the week and since March 14th are shown below:

	Lowest. March 14.	Close. March 23.	Change Last Week.	Change Since March 14.
Atchison	93	87⅜	—6⅛	—5⅝
Balt. & Ohio...	95	94½	—7½	—½
Brooklyn R. T..	45¼	49⅞	—5⅜	+4⅝

U. S. Steel....	33	34⅜	+2⅛	+1⅜
U. S. Steel, pf..	95½	97⅞	—3½	+2⅜

A disturbing influence was exerted by the announced decision of the Erie to defer certain improvements, by the advance of the Bank of France's rate to 3½ per cent., and by a perceptible raid upon Canadian Pacific shares. The loss of 8 points on Canadian Pacific on Friday appears to have frightened holders abroad, and especially in Germany. Liquidation on Saturday, largely from Europe, caused a loss of 5 points more. The results of the Harriman investigation have excited very severe comment in Berlin, where the press is warning investors to avoid American securities. Speculators depressing the market for a profit have taken advantage of this on the exchanges of Berlin and London, as well as in New York.

Large Crop of Cotton

An unexpectedly large crop of cotton is disclosed by the final report of the Census Bureau (published on the 20th) of cotton ginned in the crop year. Official condition reports in June last pointed to a crop of only 12,000,000 bales; those of October indicated even a smaller yield. The Government's estimate in December, however, of 12,546,000 was more encouraging. Now the ginning report shows a total of 13,290,677 bales, of an average gross weight of 510.7 pounds, which is equivalent to 13,576,225 bales of 500 pounds. It appears, therefore, that the crop exceeded by 2,000,000 bales any that has preceded it, except the great crop of 1904, which was 13,697,310. That extraordinary crop followed one of only 10,015,721 and immediately preceded one of only 10,697,013. Altho the yield has been so great, prices have been maintained at a high level, being only a shade lower now than they were one year ago, and 35 per cent. above those of two years ago, after a crop that was very large, but only a little larger than this latest one. Exports from the crop of 1906 have been heavy. Planters have been fortunate in obtaining good prices at home and abroad.

....Stuyvesant Fish, for many years and until a few months ago president of the Illinois Central, has been elected a director of the Missouri Pacific Railroad Company by the Gould interests. He will be a member of the executive committee.

....According to the index number of *Bradstreet's* for March 1st, the average price of staple commodities, which has been rising steadily for twelve months, reached a new high level in February. The increase in one year has been nearly 10 per cent. It has been 18 per cent. since July, 1904, and 54 per cent. since July, 1897.

....The New York, New Haven & Hartford Railroad Company has enlarged its coastwise steamship holdings by purchasing the Boston & Philadelphia Steamship Company, and transferring the same to the Merchants' and Miners' Transportation Company, in which it has a half interest. The latter company's steamers ply between Boston and Philadelphia and ports further south.

THE UNION SQUARE SAVINGS BANK.

....The beautiful new building of the Union Square Savings Bank, which we reproduce herewith, is constructed of marble. The bank is located at No. 20 Union Square. It was incorporated in 1848, the same year in which THE INDEPENDENT was first published, and the officers are Frank M. Hurlbut, president; Egerton L. Winthrop and Hewlett Scudder, vice-presidents; W. Emlen Roosevelt, treasurer, and William H. Rockwood, secretary. It has 12,648 depositors. Its surplus is $717,109, and its total assets are $9,268,950.

....Exports of iron and steel manufactures in 1906 amounted to $172,500,000, against $143,000,000 in 1905, $128,500,000 in 1904 and $99,000,000 in 1903.

....The Western Pacific Railroad Company is spending $1,000,000 a month on construction work, and it expects to have its main line from Salt Lake City to San Francisco, 929 miles, completed in September, 1908.

....The Pennsylvania Railroad Company has increased by 35 per cent. (to $600,000 a year) its pension fund for retired employees. Last year it paid $467,614 in pension allowances, and there are now 1,940 men on the pension rolls.

....At their recent annual meeting the shareholders of the Pennsylvania Railroad Company authorized the proposed increase of capital stock by $100,000,000 and the recommended addition of $100,000,000 to the bonded debt. The age limit for the employment of men was raised from thirty-five to forty-five years.

....In a little book which is a model of typography and presswork, the Franklin Trust Company, which has offices both in New York and in Brooklyn, presents clearly and compactly much useful information as to the laws and rules relating to the management, settlement and distribution of estates. There is also an explanation of the nature of the services which a trust company may render in connection with estates. The Franklin Trust Company's capital is $1,500,000; its surplus and undivided profits exceed $3,000,000.

The Independent

VOL. LXII NEW YORK, THURSDAY, APRIL 4, 1907 No. 3044

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Secretary Taft and Senator Foraker

Statements published by Senator Foraker, Charles P. Taft and others have directed the attention of the country to a political controversy in Ohio concerning candidates for the Republican Presidential nomination in 1908. The contest for the support of the Republicans of Ohio in the national convention is between Senator Foraker and Secretary Taft. On the 18th ult. the President appointed John F. Sater, of Columbus, to be a judge of the United States District Court, in opposition to the wishes of Senators Foraker and Dick, who had asked for the appointment of J. J. Adams, of Zanesville. It is well known that Mr. Foraker has been regarded as an opponent of the President's policies in the Senate. A few days later a brief announcement was made by Insurance Commissioner Vorys, of Ohio, that Secretary Taft was his candidate for the Presidency. On the 26th, Senator Foraker prepared and gave to the public a statement which was regarded as a challenge to Secretary Taft and his friends. The Secretary was then at sea, on his way to Panama. At the beginning, Mr. Foraker said he did not "want any political honors from the Republicans of Ohio without their hearty approval." He continued as follows:

"In order that there may be no doubt as to their preferences, I shall, at the proper time, request the Republican State Central Committee to issue a call for a Republican State Convention, to be composed of delegates elected by the Republicans of the State at duly authorized primary elections, for the purpose not only of nominating candidates for State offices to be voted for at our next State election, but also to determine the preference of the Republicans of Ohio as to candidates for United States Senator and for President.

"If this suggestion should meet with favor, it should be provided that the primary elections shall be held at a convenient time long enough after the call therefor has been issued to enable all who are interested in the work of the convention so to be chosen, to appear before the people and discuss the public questions about which we are all concerned, so that the people who are interested may act intelligently in the selection of their delegates, thus bringing this selection as nearly to a direct popular vote as is possible under the laws that are now in force. I have no opinions to conceal from my constituents, and there is no point in my public record as to which I am not ready to render them a full account."

Secretary Taft's political interests in Ohio are represented by persons of considerable influence, one of them being his brother, Charles P. Taft, of Cincinnati, a man of large fortune and the owner of a newspaper. On the same day, in that newspaper, Charles P. Taft published the following in large type:

"We believe that the overwhelming sentiment in Ohio is favorable to Secretary Taft for the Presidency, and our efforts are to give this sentiment concrete form so that it shall be expressed emphatically at the proper time. It is furthermore obvious that Governor Harris is his own logical successor as Governor of Ohio and should have the unanimous support of the party."

It is said that Mr. Foraker had been led to believe that the Secretary's friends opposed the nomination of Governor Harris, and that he had criticised them on this account. He appears to have been misinformed. Until the 30th there was much speculation as to the action to be taken by the Secretary's friends in reply to the Senator's challenge. On that day,

Charles P. Taft published the following over his signature:

"Senator Foraker's statement indicates that he is running for the Presidency and for the Senatorship. The friends of Secretary Taft are urging him for the Presidency. As the Senator has included the two offices in this primary contest, Secretary Taft's friends accept the proposition and will make it a distinct contest—Taft for the Presidency or Senatorship, or Foraker for the Presidency or Senatorship.

"If the Republicans of Ohio, by their votes at the primaries, indicate that they prefer Foraker for the Presidency or Senatorship, Secretary Taft is eliminated from the political situation. If the people of Ohio indicate Secretary Taft for the Presidency or Senatorship, Senator Foraker is eliminated from the political situation in Ohio.

"This is a direct contest between the friends of the administration of President Roosevelt and his opponents. We are willing to submit it to the Republicans of Ohio, and the sooner the better."

Politicians say this is a shrewd answer, partly because it eliminates Congressman Burton, of Cleveland (now with the Secretary, on the Isthmus), who has been regarded as the Taft candidate for Foraker's seat, and whose open candidacy for the Senatorship might have handicapped the Secretary. Within a few weeks the call for the primaries will be issued. The discussion will continue until November. It is asserted that the State Committee favors the purposes of Senators Foraker and Dick. It was announced last week that Elmer Dover, secretary of the Republican National Committee, had accepted an invitation to take charge of the campaign for the nomination of Secretary Taft.

Railway Questions

Railroad companies having lines in Alabama, Missouri and Arkansas will test in the Federal courts the railway laws recently enacted in those States. In response to an application addressed to Judge Thomas G. Jones, of the Circuit Court, in Alabama, he granted on the 30th ult. a temporary injunction restraining the enforcement of the new laws fixing maximum freight rates and reducing passenger rates. It is claimed by the companies that the laws are confiscatory. In Pennsylvania, the two-cent bill has been passed in the Senate by a vote of 43 to 3, and sent to the Governor, who will hear arguments concerning it. The Nebraska House has passed bills reducing express charges by one-third and freight rates on grain, coal, fruit and potatoes by 15 per cent.——In our issue of the 14th ult., after speaking of the new two-cent law of Nebraska, which had become effective on the 9th, we said: "Several passenger trains were discontinued, one of them being the Los Angeles Limited, heretofore running between Chicago and Los Angeles over the Northwestern, Union Pacific and San Pedro roads." Authority for this assertion had been found in press dispatches from Omaha, published on the 10th in newspapers thruout the country, and not thereafter corrected, so far as we know. We are now informed by an officer of the Northwestern that the report was not true. He says:

"It is an unfortunate and embarrassing fact just at the present time that a cloud-burst and wash-out on the San Pedro road, near Caliente, Nev., have caused a suspension of all thru traffic on that line for the past several days, and during that period our patrons for points in Southern California are being carried on the Overland Limited, as it is impossible for the Los Angeles Limited to get thru. This state of affairs, it is expected, will continue for perhaps a week or ten days longer, but it is merely temporary and has nothing whatever to do with rate legislation in Nebraska or elsewhere."

By unanimous vote the Supreme Court of Minnesota has released the Great Northern road from the injunction (recently granted in response to the application of Attorney-General Young) which restrained the company from issuing $60,000,000 of new stock. The court holds that the law authorizing the Minnesota Commisson to forbid the issue of additional stock is unconstitutional.——Owing to the recent Harriman investigation, there is some public interest in a suit brought in Texas by the Crocker estate and Gen. Thomas H. Hubbard. The plaintiffs ask the court to restrain the Southern Pacific from paying dividends on its common stock, and to forbid the Union Pacific from voting on any of the stock, upon the ground that the combination of the two lines is in violation of Federal laws and the laws of Texas. Their purpose is to procure the payment of interest upon the bonds of one of the Southern Pacific's subsidiary companies. ——Much space has been given by the

daily press to dispatches from Washington concerning the President's attitude toward the railroads and about the appeals made to him for the publication of a "reassuring" statement. It is reported that he may decide to say nothing before his speech at Jamestown, on the 26th. It is well understood that the President's views as to the railroads have undergone no change, and that, in any new statement he may make, he will not deviate from his previous course. He asserts that the recent fall in the price of securities and the difficulties encountered by some companies are in no sense due to his action or utterances, or to Federal legislation which he suggested. It is reported that he will recommend legislation designed to prevent stock watering in the future, but will not ask for a valuation with the purpose of disturbing securities now existing; also, that he will argue for comprehensive Federal control instead of control by State authority.

The San Francisco Investigation

No additional indictments were filed in San Francisco last week, but the grand jury continued to take testimony. It was reported that valuable evidence had been obtained from Miss Nellie Smith, a stenographer employed by the Pacific States Telephone Company's counsel at the time when the supervisors were bribed in the interest of that company. Louis Glass, vice-president of the company and a millionaire, was arrested. The testimony of one of the company's directors, showed that Ruef had been on the company's payroll for two years at $14,400 a year, and that he was receiving this pay at the time when he bribed the supervisors in the interest of this corporation's competitor, the Home Telephone Company. Until a few months ago, Ruef was accustomed to have nearly $1,000,000 on deposit in the banks of the city. He has published a long statement, protesting against his imprisonment as an "un-American" proceeding, and asserting that he can prove that all the acts of the prosecutors have been "parts of a private conspiracy." Because attempts to rescue Ruef have been expected, his guards, it is asserted, have been instructed to shoot him if any such attempt is made. Mayor Schmitz says he wants an immediate trial. It is asserted that the prosecutors have evidence that he received at least $660,000. When he was elected he was a poor man, living in an apartment rented for $35 a month. He has since spent about $50,000 upon a new house and $30,000 for furniture. Under the floor of a room in the house which he occupied some time ago the prosecutors have found a plush-lined box which, it is thought, was used as a treasure chest or private bank. The assertion was made in his interest that the box was a receptacle for his violins; but the prosecutors ascertained by experiment that a violin could not be placed in it. Rudolph Spreckels, who guaranteed a fund of $100,000 for the work of prosecution, says that if more is needed he will supply it. All the rottenness, he adds, is to be exposed; every municipal department is to be subjected to investigation; the prosecutors expect to place in prison every giver of bribes, but some who took bribes will receive immunity in return for their testimony.

A Railway Labor Controversy

Efforts were made last week by officers of the Federal Government and others to prevent a great strike of the conductors and trainmen on forty-two railways. The movement of the unions of the conductors and trainmen for higher wages began some time ago. Their demands having been rejected by an association of railway managers at Chicago, a vote of the 48,000 members was ordered. About 95 per cent. of the men voted for a strike. Their leaders then held conferences with the railway managers. The unions demanded a wage increase of 12 per cent. and a reduction of the work day to nine hours; in response, the managers offered 10 per cent. for some employees, 7 per cent. for others, and a ten-hour day. Neither side would yield. The companies offered arbitration. This was rejected by the unions, and on the 27th the negotiations were broken off. Thereupon the companies appealed to Chairman Knapp, of the Interstate Commerce Commission, and Charles P. Neill, Commissioner of Labor, under the provisions of the Erdmann Act of 1898, which are that in response to such an appeal from

either side in a controversy threatening to interrupt thru freight and passenger traffic, these two officers shall act as conciliators, and then, if their efforts fail, shall strive to obtain the consent of both parties to arbitration. Messrs. Knapp and Neill at once went to Chicago. At first the union leaders were inclined to reject their good offices, but they afterward consented to discuss the situation. At the end of last week both sides were holding their positions firmly, but it was said that no strike would be ordered for at least three days. Such a strike as the one under consideration would affect 510,000 employees and 95,000 miles of track, mainly west of Chicago. Grand Master Morrissey, of the trainmen's union, is a member of the Civic Federation's Board of Conciliation. He has been urged by officers of the Federation to accept arbitration. The head of the conductors' union is a member of the Federation. If arbitration should be accepted under the provisions of the Erdmann Act, the men would select one arbitrator and the companies another. If these two should fail to agree upon a third arbitrator, he would be appointed by the Interstate Commerce Commission, with the approval of the Commissioner of Labor.

Our Islands in the Pacific

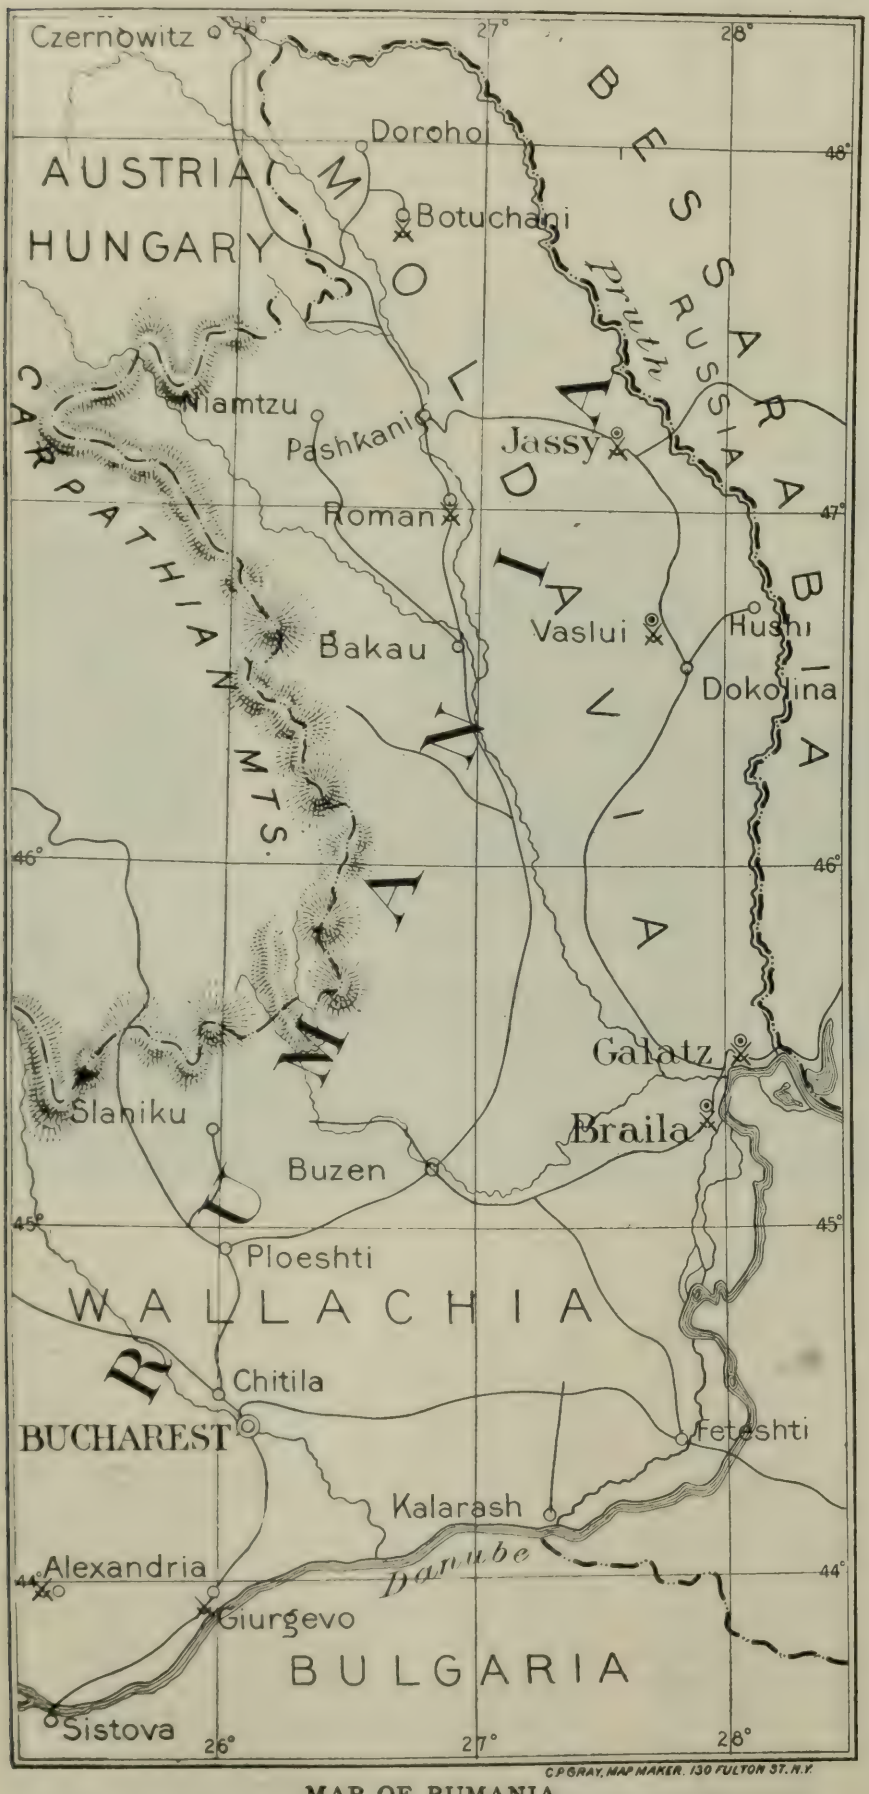
The Philippine Commission was directed by cable on the 26th ult. to inform the President whether a condition of general and complete peace, with recognition of the authority of the United States, had continued during the last two years in those parts of the archipelago not inhabited by the Moros or other non-Christian tribes. A reply in the affirmative was promptly received, the Commission pointing out that there had been no serious disturbances except those caused by outlaws in Luzon and by the Pulajanes in Samar and Leyte. Therefore the President, on the 29th, issued an executive order calling for a general election for the choice of members of the proposed popular Legislative Assembly. It is understood that the election will take place on July 30th.——Miguel Nicdao, one of the young Filipinos attending school in this country as wards of the Philippine Government, has been notably successful in competitive debates. Having won the highest prize at one of the Normal schools of Illinois, he was also the victor at a contest in which all the Normal schools of that State were represented, and he is to represent the State in the approaching interstate oratorical contest at Emporia, Kan.——It is reported that in an interview on the 28th ult. at Honolulu, Governor Carter expressed the opinion that the President had abandoned his former policy of Americanizing the Hawaiian Islands. In his recent annual report to the Secretary of the Interior, Governor Carter directs attention to a marked falling off in the attendance of Hawaiian and American children at the public schools, and a corresponding increase in the attendance of Japanese children, but does not hold that the falling off first noted in due to this increase. Of the Japanese he says:

"There is nothing to deplore in the increase of Japanese children. The Japanese are here, probably in large proportion to remain. Their natural increase has been very great, and as eight years have elapsed since annexation, a large number of the Japanese children now crowding into our schools have been born under the American flag. When these reach maturity they will have the right of claiming American citizenship. It is therefore most important that they should have full opportunity of becoming equipped with the knowledge and habits of thought requisite to good American citizenship. Apart from that consideration, it must be considered that it is the inalienable privilege of every child under protection of the flag to enjoy the benefits of that public school system which is one of the chief glories of the American Commonwealth, and which, moreover, Hawaii took as an ideal long before her admission, and continues, as part of the Union, with best endeavors to maintain."

Nicaragua's Victories

The fall of Choluteca was speedily followed by the surrender of Tegucigalpa, capital of Honduras, to the Nicaraguan invaders, who have set up there a Provisional Government under the control of the Honduran revolutionists. This Government has been formally recognized by Costa Rica. After his defeat at Choluteca, President Bonilla fled to Amapala, and it is said that he has reorganized his army. It is also said that

he is surrounded there by the enemy, and an impression prevails that the war is at an end. Salvador has withdrawn her troops from Honduras, and has asked Mexico to intervene, probably expecting that the victorious President of Nicaragua will attempt to punish her for assisting Bonilla. But Mexico is not inclined to go beyond an offer of good offices to both parties. Señor Mariscal, the Mexican Foreign Minister, says that his country will not undertake joint intervention with the United States, because Mexico has no interests in Honduras or Nicaragua, has no navy, and is under no obligation to incur the enormous expense of equipping an army of intervention. Guatemala desires peace, and has not been involved in the war. There is reported to be some agitation in Costa Rica in favor of annexation to the United States, because many think that in no other way can the republic avoid being drawn into the wars of its neighbors.



Rumanian Riots

The agrarian riots have continued thruout Rumania during the past week, and the disorder has extended over greater territory, altho the movement as a whole does not appear to have become stronger. Still it is impossible to form a just idea of the situation because of the conflicting and inadequate reports. The Russian papers are not allowed to mention the matter; the despatches from Bucharest are obviously intended to allay excitement by minimizing disturbances, and the tales of suffering and massacre from the Jewish refugees who have fled across the border into Austria-Hungary and other countries are probably exaggerated. On the accompanying map the towns and districts where the most serious disturbances have occurred are marked by crossed swords. The outbreak began in northern Moldavia, but another center of disturbance later developed southwest of Bucharest, in the vicinity of Alexandria and Giurgevo.

A RUMANIAN PEASANT GOING TO MARKET.

An army of many thousand peasants from this district marched toward the capital, causing a panic there, but they were checked by the troops. Still further to the west, in the Krajova district of Little Wallachia, there have been armed risings, and the disorder is also spreading into the Carpathian Mountains, where it is feared that the great forests will be burned. There are three different forces contributing to the riots. The first of these is the local risings of the peasants of an estate under the impulse of revenge against some oppressive landlord's agent, and the desire to obtain the land of which they feel they have been robbed. Second, there are the agitators who are stirring the people up to violence for political purposes, by means of incendiary proclamations. Students, teachers, priests and women have taken part in this revolutionary movement. Among them have also been found many foreigners; professional anarchists, Russian terrorists, Jew-baiters from Bessarabia, and mutineers from the Russian battleship "Potemkin." The third element of disorder consists of the bands of marauders who are traveling thru all parts of the country, killing and looting, apparently impelled by the desire for destruction for its own sake more than pillage. The peasants for the most part are armed only with scythes and pitchforks, but as they have been drilled in the army they have in places formed companies with something of military

MAP OF RUMANIA.
The chief centers of the agrarian riots are marked by crossed swords.

character. At Galatz the peasants assaulted the city at midnight, carrying the outer wall by storm and capturing a suburb, which they pillaged and fired. Later the insurgents were driven out by grape-shot with great loss of life. The Government has at its disposal between 30,000 and 40,000 troops, but it is impossible for them to cover all points of danger. Wallachian soldiers are used in Moldavia and *vice versa*, in order to prevent them from fraternizing with the insurgents or being compelled to fire on their own relatives. A state of siege has been proclaimed thruout Rumania, so the military will have a free hand in putting down the revolt. The Conservative Ministry under Prince George Cantacuzene has been compelled to resign, and its place is taken by a Liberal Cabinet under Dimitri Sturdza, who has long been a champion of the cause of the peasants. The Conservatives and all his other political opponents have promised the new Ministry their hearty co-operation and support in this crisis. Several of the ministers have gone in person to the disturbed districts to appease the peasants by personal influence and argument. The Government has issued a proclamation in the name of King Charles announcing the suppression of the heaviest taxes and that hereafter the farm lands will be cultivated by the State or leased direct to the peasants. The big farming syndicates which have practically monopolized the agricultural land of Moldavia will be restricted to 8,000 acres apiece. Other agrarian reforms are promised. Within the last few years rents have been raised to two or three times their former amount without any cause except the greed of the landlords. The American Committee for the Relief of Sufferers of Russian Massacres has voted to use the funds which it has on hand, amounting to $130,000, for the Rumanian Jews.

The Papal Papers

The papers which were left in the Papal Nunciature at Paris at the time when the French Government expelled the Secretary, Mgr. Montagnini, were seized by the Government and are now in the hands of a committee of the Chamber of Deputies, which is collating them with a view of their publication. The clerical *Figaro* has endeavored to break the force of the expected revelations by the publication of abstracts and quotations from some of the documents, which, it alleges, were obtained "from the highest source." The writer in the *Figaro* states that the documents contain "on the whole nothing compromising for the Holy See," tho there are many points of piquancy which will make some people feel uncomfortable. The most interesting from a political standpoint is the private notebook of Mgr. Montagnini, who had the unfortunate habit of putting down every day details of his conversations with prominent men, and his opinions as to the trustworthiness and private character of prelates and politicians. One of the piquant notes is that in which Secretary Montagnini gives the names of many politicians who are suffering from impecuniosity. Among them is that of M. Clemenceau, now Premier, of whom Mgr. Montagnini says that an understanding might be reached with him, but "it would need a large sum." Premier Clemenceau, taking advantage of the French law which compels a paper printing libelous matter to publish the reply of the person attacked in the same type and position as the libel, has denied thru the *Figaro* the charges against him and denounced them as Jesuitical filth. He declares that he will publish the papers all in full as soon as he is at liberty to do so. The chief points brought out by the *Figaro's* abstracts are that several French political leaders were trying to keep on good terms with Rome after the separation. Among those mentioned are MM. Rouvier and Doumer. One of the letters from Cardinal Merry del Val, the Papal Secretary of State, conveys his thanks to a deputy for a cask of cognac and suggests that the Pope would like a cask for himself. The papers confirm the statement made by Minister Briand that the first Plenary Council of the French Bishops favored the acceptance of the law of 1905.

Russia and the Duma

The Duma has attacked the system of summary court-martial, which has been a chief weapon of the Government against its enemies. After the dismissal of the

first Duma an Imperial decree conferred the power of arbitrary arrest and immediate execution on the local military authorities without trial, but this power will lapse if it is not re-enacted within two months after the convocation of the Duma. Deputy Malakoff, Constitutional Democrat, introduced a bill providing for the appointment of a committee of sixteen members to draft a measure abolishing the system to present it to the Duma. All of the members except the extreme Reactionaries spoke in favor of it. A speaker in Cossack uniform declared that his people were ashamed of the police work which the Government compelled them to do. Premier Stolypin in reply said the Government could not consent to the abolition of the courts martial so long as "the bloody miasma of terrorism overshadowed the land," but orders had been given to employ them only in cases of extreme necessity. He said:

"We are arraigned as bloody-handed executioners, but Russia is able to distinguish between blood on the hands of a hangman and on those of an experienced surgeon. History will say that we were surgeons inspired with an honest desire to cure the country."

The anti-Semite, Krushevan, said that the disorders in Rumania were due to the same cause as those in Russia and other lands, namely, the economic exploitation of the peasantry by the Jews, who held 1,250,000 acres in Bessarabia, thru intermediaries, and ground extortionate profits out of the miserable peasantry. The Constitutional Democrats consented to modify the clause requiring an immediate reporting of the bill, and the resolution was then carried by the votes of all members except twenty of the extreme Right.——Dr. Jollos, the editor of the *Russkia Viedomosti,* a Liberal newspaper, was assassinated in Moscow by an unknown youth, who fired two shots at him with a revolver. Dr. Jollos was a member of the first Duma and a friend of Professor Hertzenstein, who was murdered by an emissary of the reactionary League of the Russian People in Finland last summer. There is no doubt that this murder is due to the same organization, for the assassin made the attack from the building in which the *Vietche,* the organ of the League, is printed. In the Duma the leader of the Social Democrats charged the League with the murder.

Oudja Seized

The murder of Dr. Mauchamp by fanatics in Marakesh (Morocco City), who were frightened by the geodetic signals on the consular building, has aroused the French Government to take energetic action against Morocco. M. Regnault, the French Minister, accompanied by the commander of the cruiser "Jeanne d'Arc," presented to Mohammed el Torres, a representative of the Sultan at Tangier, the demands of France for reparation and the protection of Europeans resident in the country. The demands include the punishment of the murderer, an indemnity for the family of the victim and the appropriation of a large sum for a charitable institution in Morocco in memory of Dr. Mauchamp. Mohammed el Torres assured the Minister that measures have been taken for the maintenance of order, and that he had sent instructions to the Governor of Marakesh to supply escorts for all Europeans who desired to leave for the coast and to place guards in the houses of those who remained in the capital. The French cruiser "Lalande" has gone to Mazagan to transport the body of Dr. Mauchamp to Tangier. In order to impress the Moroccans with the power and determination of the French Government the seizure of Oudja was ordered. Oudja is a small walled town near the Algerian frontier occupied by a garrison of Moroccan troops. It contains about 1,500 Mohammedan and thirty Jewish families. A column of occupation, consisting of 3,000 infantry, two squadrons of cavalry and two batteries of artillery, was prepared at Lalla Marnia, Algeria, and, moving quietly, took possession of the town without opposition. The Moorish governor met the French commander at the gate and assured him of the friendliness of the population. There has been no disorder. Colonel Reidel, Chief of the Staff, has set to work to clean up the town, and has established a hospital and dispensary. Oudja has been occupied by the French twice previously, in 1844 and 1859. None of the Powers have offered any protest to this action of France. Chancellor von Bülow says that Germany did not look with disfavor upon the occupation if it were temporary.

Our Foreign Commerce

BY OSCAR S. STRAUS, LL.D.

Secretary of Commerce and Labor.

MANY great factors are to be considered in the solution of the problem as to what we may do to continue and still develop the phenomenal growth in our exports. Some of them are exceedingly important and entitled to far more consideration than is usually accorded them in our study of the future welfare of our country.

Friendly sentiment or good will of foreign nations, in my opinion, is a greater economic and international factor than it is generally recognized to be. There is another, one which comes in close conjunction with sentiment and good will, and that is immigration. This as a commercial stimulus draws after it and reflects back to the mother country a greater commercial intercourse than appears on the surface.

The friendly sentiment which exists between nations, while due in many cases to descent from a common stock and to the presence in one country of many former citizens of another, is also due to the existence of that other commercial factor, invested capital. The friendly sentiment existing between the United States and all English-speaking nations is, of course, the result, to a great extent, of a common parentage and the use of a common language as a medium of intercourse. In the case of our dealings with the Germanic nations there is not only the close relationship between the Anglo-Saxon and the Germanic, but also the presence in this country of millions of representatives of those nations.

The number of immigrants admitted into the United States from Germany alone since 1820 exceeds 5,000,000, and the number of natives of that country residing in the United States at the present time is nearly 3,000,000. The number of Austrians residing in the United States at the date of the last census was over a quarter of a million; natives of Holland over 100,000; and of the natives of Norway and Sweden and Denmark over 1,000,000; while of the natives of the United Kingdom the total in 1900 was 2,500,000 and of Canada more than 1,000,000.

The latest available statistics indicate that the number of natives of the United States now residing in the United Kingdom is approximately 30,000. The German census of 1900 showed the presence of practically 18,000 of our citizens residing in Germany. The Mexican census showed nearly 16,000 Americans residing in Mexico in 1900, and the Canadian census of 1901 showed about 41,000 natives of the United States residing in Canada. Subsequent Canadian records show a migration of from 25,000 to 45,000 per annum from the United States to Canada, which suggests that the number of our own people now residing in the Dominion is probably over 100,000.

Our consul-general in Mexico reported some two or three years ago that over $500,000,000 of American capital was invested in that country, and persons well acquainted with the movements of investments out of the United States are of the opinion that this sum has been increased since at the rate of perhaps $100,000,000 per annum, and that the total American capital invested in Mexico approximates $800,000,000. Reports from our consuls in Canada and

other available sources indicate that the investment of American capital among our neighbors on the North is also to be measured by hundreds of millions.

Our consul-general in Cuba has indicated that, in his opinion, the amount of American capital there invested is between $100,000,000 and $200,000,000, and a study of this subject recently made by the Bureau of Statistics develops the fact that probably $100,000,000 of American capital have been invested in the Hawaiian Islands, and from $10,000,000 to $15,000,000 in Porto Rico. In the great countries of Europe, where capital is plentiful, American inventions and American skill in manufacturing and management have combined with local capital to develop great industrial enterprises, which have strengthened the cordiality of sentiment existing between the two peoples.

There is no difficulty in proving that the existence of these factors—sentiment, immigration and invested capital—has been followed by the maintenance of cordial commercial relationships. The United Kingdom, having with us a common language and of whose people we had in 1900, 2,750,000 in the United States, and to which we have sent 30,000 of our own people to become permanent residents in its communities, is the most important customer for American exports.

Germany is next in importance in both our export and import trade. Of German people we had in 1900 two and two-third millions, and today have perhaps as many as 3,000,000, and in that country 20,000 Americans now reside. Canada follows, and of her people we had in 1900 over 1,000,000, and she has 100,000 former citizens of the United States. In Canada are invested large sums of American capital. Still another country with which our trade relations have grown with wonderful rapidity is Mexico, which takes two-thirds of its imports from us and sends three-fourths of its exports to us. In that country probably 20,000 former citizens of the United States reside and hundreds of millions of American capital are invested, while the number of former Mexican citizens now residing in the United States is over 100,000.

There is negative proof to add to the positive proof that sentiment and good will between nations needs immigration and invested capital for the growth of trade relations. Indeed, there is a reverse side to the picture. Our friendship for France is a matter of history. Altho our relations have always been cordial, we have often wondered that our trade grows so slowly and that we supply only about 10 per cent. of its imports, while to Germany we supply 14 per cent., to the United Kingdom 25 per cent., and to Canada 60 per cent. of their imports. While this apparently anomalous condition is doubtless due in part to the restrictive policy of France, may it not also be due in some degree to the fact that the total number of French residing in the United States in 1900 was but 104,000, as compared to the millions of the United Kingdom, Germany and Canada?

To prove my proposition further, the surprisingly rapid growth of our trade with Italy in recent years is but an additional argument supporting the theory that the closeness of relationship between the peoples of the two countries is an important factor in the development of commercial relations. Our trade with Italy in recent years has expanded from practically $40,000,000 in 1896 to nearly $90,000,000 at present, and at the same time the number of Italians in the United States, which in 1900 was nearly 500,000, has grown with phenomenal rapidity in recent years, with a correspondingly gratifying enlargement of our trade relations with that country.

The number of Russians in the United States in 1900 was nearly half a million, and the increase since then has been very great. The value of our exports to Russia has more than doubled in the last decade and the value of our imports from that country more than quadrupled. We have wondered and with reason at the slow growth of our exports to South American countries and especially at their small value when compared with the large amount represented by our imports from that section of the world. But possibly we do not take into consideration the fact that the South American countries are peopled by races less

akin to us in nationality than those previously mentioned, and that American citizens and American capital are seldom found in those communities. The South American countries are generously populated with Europeans and are enjoying the beneficial effects of their capital. The number of South Americans residing in the United States in 1900 was less than 5,000 as compared with the 100,000 from Mexico.

The conclusions to be drawn from these facts and figures are clearly that the sentiment of friendship as well as that of cordiality has accompanied the development of commerce with those countries with which our commercial intercourse is greatest and most satisfactory and that it should be continued and fostered.

There can be no doubt that the presence in the United States of capital from foreign countries and the presence in such countries of American capital does strengthen commercial relations between the nations, while the presence of industrious citizens from other countries has been of great aid in developing the many industries that have made us the most wealthy and prosperous nation in the world, as well as the greatest manufacturing nation, and placed us in the front rank of exporters of domestic products and of manufactures.

For the purpose of properly expanding and enlarging our trade relations, it is of the highest importance that the executive branch of our Government charged with the cultivation of friendly relations with foreign countries shall not be hampered by any narrowness or short sightedness on the part of our lawmakers, either national or in the separate States, for every obstacle that is put in the way of friendly international relations is bound to reflect and act as a check upon our foreign commerce, and at the same time upon our wage-workers, of whom so many are employed in industries and manufactures engaged in exporting. As it has been shown that the movement of population from one country to another is one of the fore-runners of international trade, as well as a great factor in promoting it, we must have a care not to put unreasonable checks on immigration.

So long as the exclusion law was clearly understood to apply only to the coolie class our trade with China grew with rapidity. Her merchants and travelers and representative people visited this country freely and sent their sons to be educated in our schools, colleges and universities. In like manner Americans visited China freely, and the number of our people residing in that country increased from less than 1,300 in 1894 to over 3,200 in 1904. Our exports to China grew from less than $5,000,000 in 1895 to over $50,000,000 in 1905, and while we believe that the loss of over $20,000,000 shown in the returns for 1906 was due, in some degree, to the fact that the trade of 1905 was abnormally large, there can be no doubt that it was due in some part to the recent trade boycotts, resulting from the feeling on the part of the Chinese that their representative people do not receive proper treatment when they apply for admission into the United States. So apparent was this fact that President Roosevelt, in a message to Congress a year ago, urged the enactment of a Chinese admission law.

The individual merchant or manufacturer knows that he can not expect to hold customers whom he openly offends or brutally insults. The same is true of a nation. It can not offend another nation and hold the trade of its people. International courtesy is as essential to international good will as is a similar relationship between individuals, and the consequences in the former case are far more serious and permanent. The merchants and manufacturers of our country can perform no more valuable service to the nation and to the promotion of foreign commerce than in strengthening public sentiment to support the Government in cultivating these friendly relations with other nations which are so essential to good will and good trade relations.

Our trade with Japan has shown a surprising growth in recent years, during which time a feeling of deep friendship has developed between that remarkable race and our own. Her people have been welcomed to all the privileges and immunities enjoyed by the most favored nation, except actual citizenship. The privileges of Americans residing in Japan, the number of whom has nearly

doubled in the past decade, have correspondingly increased.

Our great silk manufactories, which employ thousands of workingmen and disburse over $30,000,000 a year in wages, have drawn largely for their raw material upon Japan, sending her nearly $40,000,000 for raw silk in the year just ended. Japan in turn has purchased freely of the products of our farms and factories, so that our exports to that country have grown from less than $8,000,000 in 1896 to over $38,000,000 in 1906. In view of these flattering commercial relations with the dominant power of the Far East, it is a matter of serious regret that recent incidents in a single community of our country—a community that has profited largely thru the enlargment of our trade with Japan—should have endangered the cordiality of relations under which that trade has developed.

While this occurrence is too recent to have had as yet a perceptible effect upon trade relations, it requires no stretch of imagination to foresee that unless these deplorable incidents are satisfactorily adjusted they will have a disastrous effect upon our future trade with that country. On this subject I believe the President voiced the sentiment of the great mass of our people when he said in his message to Congress:

"Not only must we treat all nations fairly, but we must treat with justice and good will all immigrants who come here under the law. All we have to question is the man's conduct. If he is honest and upright in his dealings with his neighbor and with the state, then he is entitled to respect and good treatment. Especially do we need to remember our duty to the stranger within our gates. It is a sure mark of a low civilization, a low morality, to abuse or discriminate against or in any way humiliate such stranger who has come here lawfully and who is conducting himself properly. To remember this is incumbent on every American citizen, and it is especially incumbent on every Government official, whether of the nation or of the several States."

Altho the question of ethics in the growth of international commerce may at first sight prove novel, there is really nothing new about it other than that the nations of the world are growing more enlightened, because the basic principles of honesty and courtesy in individual business naturally extend to the larger enterprise of international trade relations. As I have traced out, the growth of trade relations is attributable, in some degree at least, to cordiality of international relationship and of relationship between our own people and those of the nations with which we come into business contact. The future success of our manufacturers and exporters rests in their own hands.

Our Government can do certain things. It can, for instance, maintain a great department, such as that of Commerce and Labor; it can record the movements of articles into and out of the country, and the names of countries from which imports come and to which exports go; it can show the growth of exports of various articles, the demand in a given country for the same; it can send its consuls and special representatives to the various nations of the world to learn what markets exist for our goods, and how they must be made and packed and sold to meet the requirements of those markets —but it cannot bring to our manufacturers and exporters that close personal relationship with the people of these nations that is so essential to them if they are to maintain the greatest measure of success.

By sending special representatives to solicit trade, by establishing banking and other facilities therefor, and by cultivating and maintaining friendly relations the exporting nations of Europe have obtained their success in the markets of the world. And when I say special representatives I mean men representing the manufacturer, and so familiar with his own individual methods of production and with commerce that they can present to him the details of the existing trade opportunities and the processes to which he must adapt his own existing methods in order to make his goods salable in the communities in question. These are the things the Government cannot do for the manufacturer and the exporter—things they can do only for themselves.

In round numbers the world's imports of manufactures now aggregate $5,000,000,000 in value, and of that amount we are at present contributing but $700,000,000, or about 14 per cent., altho we are the world's greatest producers of all the important articles used in manufacturing, such as cotton, iron, copper, timber

and coal, the last of which furnishes the power necessary to transform the others into the finished products.

We also have the world's greatest system of railways with which to assemble these raw materials and carry them to the water's edge. Whether our Government shall aid in building a great merchant marine for carrying these products, already cheaply transported, from the water's edge to the principal foreign markets, or whether such aid should be confined to those sections with which our trade has shown little development and to which foreign capital is offering us no direct system of transportation, is a matter yet to be determined.

But certain it is that, whatever the Government may do in aid of our foreign commerce, or in collecting general information regarding trade opportunities in foreign countries, the real opportunity for success in those markets rests with our producers and exporters, who, by sending their personal representatives among these people, will not only obtain for themselves the information necessary to that trade, but will, at the same time, aid in developing that international sentiment and close relationship which have proved so important a factor in our commercial relations with the countries where our greatest success has been attained.

WASHINGTON, D. C.

Plain Living and High Thinking

BY A. EMERSON PALMER

(William Wordsworth, Born April 7, 1770)

"Plain living and high thinking are no more."—Wordsworth (1802).

"PLAIN living and high thinking"—time-worn phrase!
Were they indeed, O Wordsworth, then no more?
In haste thou saidst it, mindless of the store
Of wisdom which, in those degenerate days,
Thou gav'st a world ungrateful. Thy plain ways,
Thy lofty thoughts, the verse thou didst outpour—
These in themselves thy refutation bore,
And proved thine outburst but a passing phase.

"Plain living and high thinking!" Noble words,
Which thou and thy successors took to heart,
Blessing a century with their poets' art,
Their strains as pure and free as songs of birds.
They kept the faith; 'twere needless then to name:
Such souls alone redeem an age from shame!

BROOKLYN, N. Y.

Coming Home in April

BY E. P. POWELL

Author of "The Country Home," "Old Farm Days," Etc.

WHISTLE! whistle! whistle!—thru the high, clear, blue, crisp, atmosphere! One bluebird, ahead of all others, cutting his way northward. Was ever sky more clear and sweet! ever a bird more happy or blue! ever a thought more full of hope than Home Again! Are the houses, and cows, and barns, and dogs, and folk all alive and in sight, my bird? I think by the song that they must be. The melodious blue dot sails on—a song afloat—a joy in the air—conscious contentment. I think he could have been courier of some Messiah. A whole bird population, nations and tribes, are behind! Houses are to be built, families are to be reared, songs are to be sung, and duty is to be done. Oh, what is duty?—only to be happy, in the right sort of way.

About the first of April there is a stir of consciousness all thru the world, and it expresses itself in everything, as well as in everybody. The springs break loose, and the huge snow banks melt, and run down the hill with a dash. The brooks are being cleared, and the stones stick up for water to jump over or run around. A patch of the meadow by the creek shows bare, and bits of the road are gritty. The sap is stirring in the trees, and the father has already tapped his trees. The mother stands meditatively in the door, looking over her pink bed and thinking garden. Surely something is coming; it is Spring.

The bluebird notes vibrate thru the crisp air over the orchard, but he is not alone. The robin is generally heard as early as the 5th of March, and by the 1st of April he is here in considerable numbers. I find it desirable to plant many barberries and high bush cranberries, so that, when hard put to it by storms, robin shall not starve. I have seen him at both ends of his homestead. His flight northward begins in the afternoon, generally near night. In 1905 their flight from the bayheads of Florida began on the 20th of February and for two or three days it continued, beginning regularly at about five o'clock. On the 12th of last month, while still in Florida, a cry overhead drew my attention at about three o'clock in the afternoon. Blackbirds were collecting and sailing around under excitement, with many a caw and call. I counted this flock, and there were just forty-one. There were special leaders, who went with sharp commands thru and thru the division, until order was perfect. Then they beat the air with their wings, rising beautifully, and moving, every one in his place, like well drilled cadets, northward. About three o'clock every afternoon for a week the grackle tinkle could be heard, first in the pine trees and then in the sky, until a small cloud of blackbirds had moved off. The red wings remained, and I think they never go altogether to the North. There are a few, however, with each flock of their black friends.

All these bird flocks do not go back to their old homes, but, for reasons not always easy to determine, they change their localities. Yet home love is very strong with birds, and they may generally be expected to return to the neighborhood they occupied the previous year. Robins will even take up with old nests. I had two such families under my eaves in 1906. The nests were in good repair, and so sheltered as not to be storm-beaten. I did not see any housecleaning, however, and, from what I have seen of the robin, I do not consider her to be a tidy housekeeper. Bluebirds like the old hole in the tall stump or apple tree, but they take pains to clean it out before re-occupying it. The one most slovenly bird of my acquaintance is the English sparrow, but he does not even migrate. His home is always occupied, and always very filthy. If I had no other reason for banishing this fellow, I would do it simply to prevent the breeding of fleas and the accumulation of filth.

The most interesting feature of this home-coming of the birds is the inquisitiveness of the first arrivals. I am not

quite sure that all of them send on advance couriers, but I know that many of them do, and that these go back a day or two in their flight and report. You see, if I have sold my knolls, and some one has got possession who does not care so much for birds, my pets must find it out. However, it will be a stipulation with my followers and my heirs that the riparian rights of the robins shall always be respected. It will be a long while before they find the bird paradise which I have created turned over to an unsympathetic, and for that matter unpractical, owner. I have noticed that my favorite catbird always comes with marked caution. For a while after arriving he peeks about among the bushes, sits on his favorite elm and whistles softly to himself, until he is satisfied that there are no new cats around, and that the coast is clear for home building. Then he lights on a branch near my window and calls. We have it out right then and there. I do not know which is gladdest. It is not improbable that these advance couriers frequently cause changes of locality. They discover where more cherry trees or more berries have been planted, or possibly find plantations have been plowed up. Then again a forest clearing may have destroyed a lot of their wild cherry trees, and made food less sure. One thing you may be sure of, that social cooperation among the bird tribes is more perfect than it is among men. They not only are well individualized, but thoroly socialized, and just now we might learn some lessons of them to our advantage.

At last, toward the end of April, the coming home is nearly thru with, and we shall be a huge corporation for another year. And there is the point of it, that, whether we will or no, the birds make socialists of us, without our knowing it. We and the birds will cultivate these fields together, and will share together in the work as well as in the harvest—from now till October. There is hardly a fellow in the whole company, of any color or song—speech I ought to say—who could be withdrawn without damage to the whole of us. There are a few exceptions, just enough to keep the contrast recognizable. We are pretty nearly a solid trust; but we are a socialist trust. Perhaps you would prefer to call it a co-operative family. The division of products during one of these co-operative efforts is about fair; but if any one comes out a starveling it will probably be some human braggart. If a man goes into an alliance of this sort he must use his wits, and use them well.

The coming back of toads and snakes you may not hold so delightful, but they are needed by April, and they will be on hand. A good sized black ant is just now on one of my window panes, directly in front of my desk, and he is destroying gnats. He pounces on one, and then dashes for another. He has killed already dozens of the little pests. I never knew before that coming home all around was so essential. The balancing in nature is something never to be lost sight of. These little midgets came in around the evening lamp, and I have needed a compensative force to get rid of them. I am needed myself to look out that one force, of a malignant sort, does not anywhere get the upper hand, before the birds, toads and other helpers can take hold. The toad does for the ant what the ant does for the gnat, and the snake does a similar office by swallowing the toad. Which do I need most; and which most needs me? I am satisfied that to unbalance nature is not safe, and so I am keeping my toads as carefully as Celia Thaxter kept hers. As all the snakes hereabouts are harmless and helpful, they, too, find a welcome. It is very comforting, now as life begins to pulsate and throb into a thousand forms, to find that so very large a proportion is benevolent, and so very little of it malignant. The problem of this malignant part is yet to be solved. It is probably the development of some careless unbalancing, that occurred in the past.

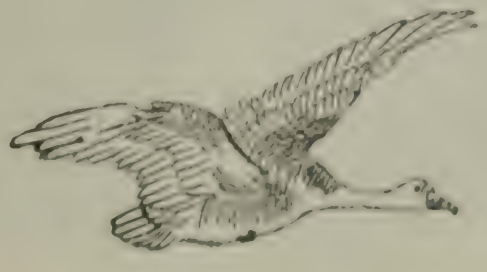
The coming back of the flowers is just as delightful and quite as remarkable as that of the birds. The crocus and snowdrop are all ready as early as January. Their first leaves are formed in midwinter, and so put together as to form a sharp tip, that can be pressed up thru the soil. The push of life will be given just as soon as the frost lets loose its grip. The flower bud also is ready, and will follow right after the wedge of leaves. This will be in April, and the touch of light and air will quickly give the ex-

panded blossom. The sharp leaf tips are not temporary, but persist, in all these early plants, giving them their characteristic beauty. This is true not only of the snowdrop, but of the daffodil and the hyacinth. They all have these lance leaves.

The first flower of the spring need not be as beautiful at all by comparison. It need only just be a flower— a foretoken, a coming back of life. How we, who have managed to meet, and in part to endure, the blizzards, give our whole hearts to the little ill-smelling coltsfoot, the first to get here out of the hidden realm! A month later we would not care for the rather coarse plant and rather disagreeable flower, but today it seems very winning, and even calls us to get down and pluck it, in handfuls, for the vase. Then the children clap their hands at the sight, while they hum about the house—for they, too, have suddenly become spring flowers, and their petals are opening to the new season of sunshine.

I like the colors of the crocus and those of the hyacinth, because this very color, a blaze of reds and blues, indicates a severance from winter. These flowers are just off the edge of the snows, but they belong, all over, to the new life of the new year. We speak of the "hyacinth snow," and there will surely be a flurry, if not a heavy fall of snow, while the hyacinth is in blossom. They come home just a little after the snowdrops, and both of them are prepared to express their gladness along the margin of a year. The tulip waits a little longer, until it can stand straight up, and look around, as if the homecoming of the floral world were accomplished. You must let your crocus alone pretty much, anywhere about the lawns, to take care of itself, and the hyacinths, if given a rich corner, will lie down quietly under the storm and come up all right. In one respect the tulip is like the crocus, for it will do its best almost anywhere. When once planted it refuses to be dug out, or to die out from neglect. The sun is very pale in April, as if really needing to grow ruddy with the months. It is the time for rich golden or crimson flowers that can take good care of themselves. I have just come in from a little nook over toward the glen, where I found a lot of crocus that I planted at least twenty years ago, along the edge of the pear orchard. There they are still blossoming, and the bees fairly reveling in their sweetness.

But Gladys, meanwhile, has gone to the woods, to find if the wild flowers have got home again. Her first message is a single timid hepatica, a mousy little thing with a blue tinted white petal, that looks for all the world like a half-frozen lassie when she reaches school one of these frosty mornings. A few days more and she will come in, with her lap full of anemone, and squirrel-corn, and hepaticas galore. I do not think that our cultivated flowers give as much pleasure as the wild ones. If one does not have a bit of woods near by, he should make something like it in a nook or corner of his lawn. Gather the bloodroot and the trilliums, and let these riot in semi-shade. They will take hold with marvelous readiness, and give you a simple pleasure that you cannot get from the art of the florist. When the violets are here spring is already in full command, and nature is thinking about summer. There are April violets, one of them a tiny little bit of life, that carpets the moist stretches near the creeks, and there is a yellow violet that gets in its ray very early. I think they are all very sweet, but one must have some imagination to find this out about the earlier sorts. What does Burroughs mean by saying that our violets are not sweet-scented? Most of them have this kind of language for sensitive noses.



It is these simple joys, of the simpler forms of nature, that must be put together to make our lives full; and then it comes about that, as Mr. Lathbury says, "ecstasy becomes normal." Get the morning to key with the evening, and April with October. Learn what the months are doing and what the days are saying, and what is going on with the bees, birds and flowers. Long before Esperanto there was a universal language; and in that speech David and Homer understood each other, and so do Jesus and Buddha. Have you ever seen a collie dog trying to talk? He uses almost every muscle in his body, and it stands for you to comprehend his meaning. We need not expect our animal and bird friends to acquire human articulation; but sure-

ly, with our rational powers, we ought to be able to enter linguistically into sympathy with creation about us. I do not forget that in my own homecoming, this April, I anticipate no joy richer than that of full fellowship with my animal kin. Togo will hear my footsteps and distinguish them while I am an eighth of a mile from him and out of sight behind the hedges. The joyousness of that greeting will be that of true and loving friends.

In Florida, with all its wealth of flora, and its eternal summer, I miss the coming home of birds and flowers; the starting out in home keeping, the courting and the quarreling, the business airs, the publishing of banns, and then the announcement of the first born. Down there flowers are always at home, and roses can be gathered by the armful in January. Birds have their nesting season in midwinter, and there is a good deal of song every month of the year. Even your domestic animals feel less dependence upon you, and the bees do not seem to be private property. They do not need your care, and, if neglected, can shift for themselves. Here, in New England and New York, the very first thought of the birds is house-building, family rearing and the song of labor—the happiest song that this world ever hears, going up continuously into the arch of heaven. I do not know why we should have less comfort or exercise less common sense than the birds. Some of us are learning to migrate to the South for winter; and we, too, go homeward in April. We get the very instinct of migration into our legs and lungs. As November whistles around our cars, it is a part of nature, to get away from the blizzards, if we can. And then as April comes to us, under our pines and in our orange orchards, we cannot sit quiet. We dream all day of the brooks and the hemlocks and the maples and the apple orchards. We would give a dozen oranges for a single Northern Spy. Our collie comes, and looks up into our face with a mute inquisitiveness. Why not? Are the plow days not at hand? Are the wild days not gone out of the Oriskany Valley? Let us go home. We look about with a startled conviction that the time has come. We pack our trunks and obey the instincts of nature.

April is a month by itself. It has little sympathy with its predecessor, altho it laps over into the moods of May. The last of the birds get here about the 5th to the 7th of May. April is purely a month of beginnings, when we start all things over again. We look only forward, and forget the past. Life has a new chapter, full of possibilities; and it is for us to make it full of progress. The patches of verdure which noted its beginning are now green valleys; and along the forest edges the buds of elms and maples are swelling into leafage. Bobwhite is everywhere abroad, for he knows that the time is up when, for no crime at all, he may be shot. He comes home from the scrubs and the thickets, and runs for awhile heedlessly about our paths. The chipmunk sits on the sunny stone pile, and eats crackers that we toss him. The scared and dwarfed dandelion, that peeked out from under the hedges, has made bold to plant itself in the middle of the lawn, and its buds are just breaking into bloom. Bonfires scent the night air, for it is a time of clearing up the old and giving the new a chance. It is the month that brings us all together, oils the machinery, and gives orders for the months ahead.

Civil War in Russia

BY WILLIAM ENGLISH WALLING

RUSSIAN CORRESPONDENT OF THE INDEPENDENT.

THE military aspect of the Russian Revolution must finally decide the great struggle. Nor does it concern Russia alone. The United States and several other modern nations think they are permanently free. But if the art of modern warfare is so developed that a fraction of the nation, the Government, has at any time the physical power to keep the rest of the nation in subjection, freedom has no concrete foundation on which to rest. Our liberties depend largely on the character of the arts of war. If coercive government is possible today, it is because the modern means of war give a coercive government the physical superiority. Could such a government maintain itself today?

Since the invention of repeating rifles, rapid-fire cannon and machine guns, no people has been in revolution against its government. We can neither say how heavy the popular majority would have to be to win against the disciplined and centralized armies of the government, nor if the people did win, can we say what would be the slaughter the victory would entail. Terrible and unspiritual as the question is, it is of supreme moment and it is one of the greatest questions that the Russian Revolution has to answer. Some of the conditions are special to Russia, but this much is general—the Government in Russia as elsewhere has a monopoly of most of the machinery of modern warfare, the possession of the strategic points, the use of a large, disciplined and centralized army of professional fighting men.

Already, for more than a year past, the

Russian Government has practically been at war with its people. Military law prevails thruout the whole empire. The military courts are backed by an enormous military power. The war against the people is being carried on by a full score of modern army corps. An army of more than two hundred thousand men is holding down the Poles, armies of from 50,000 to 100,000 are burning and hanging from day to day, month to month, and even year to year, in the Caucasus and the Baltic Provinces. Armies almost as large are the sole means of preventing insurrections practically en masse of the people of St. Petersburg and Moscow. Every city in Russia is an armed camp.

In all these armies nearly all the more brutal and dangerous work falls to 200,000 Cossacks. They are loyal and enthusiastic killers, and being half foreign, they are as serviceable in massacreing Russians, Letts or Jews. It is for this reason that another hundred thousand are divided into small bands and kept occupied beating, maiming and killing the rebellious Russian peasantry. But peasant rebellions have increased recently in number and intensity and the hundred thousand have become insufficient. As there are no more Cossacks, the fourth hundred thousand being occupied on the Manchurian and other frontiers, a second army, called the "rural guards," has been newly created for this part of the governmental campaign.

On paper the Russian army, including these Cossack brutes, consists at the present time of some two million men. The mutinies of the year past prove that few of these except the Cossacks can safely be counted on for service in the present internal war. Several hundred thousand of the common soldiers, chiefly former workingmen, would even turn their guns against the Government if they could. The rest—more than a million peasant soldiers of the line—are clearly a neutral force. They have neither the organization, determination, dash or physical ability to create a successful revolt. In case they did mutiny they would probably prove helpless against the loyal troops that are carefully mingled with them in every camp. On the other hand, they would certainly be glad to desert the ranks at the first opportunity—if for no other reason, to avoid the suffering and hardship of the

COSSACK CAVALRY

RUSSIAN INFANTRY OF THE LINE.

Russian soldier's life. This life has always been hard, the discipline always severe, and since the revolution things are worse than ever. For the suppression of agrarian disorders, then, such soldiers could scarcely avail. An irresistible opportunity for individual desertion would be afforded the moment they were spread in the inevitable small detachments over the land. Moreover, they have nearly all now taken part in peasant disturbances in their own villages before they were torn from their homes and taken to the barracks. They might mutiny, they would probably desert, they would certainly be useless in an agrarian uprising.

The Government can count on its four hundred thousand Cossacks and on some one hundred thousand other troops of favored regiments. The newly formed "rural guards," if not very valuable, are probably loyal, as are also an equal number of the gendarmes and of the police. Here are some seven hundred thousand armed and disciplined men. There are also some fifty thousand loyal army officers and several hundred thousand rural police, spies, ruffians and black hundreds which the Government has armed and can rely on where the warfare has not yet entered into a critical guerrilla stage. In all, however, the Government has at its disposal then a million armed men.

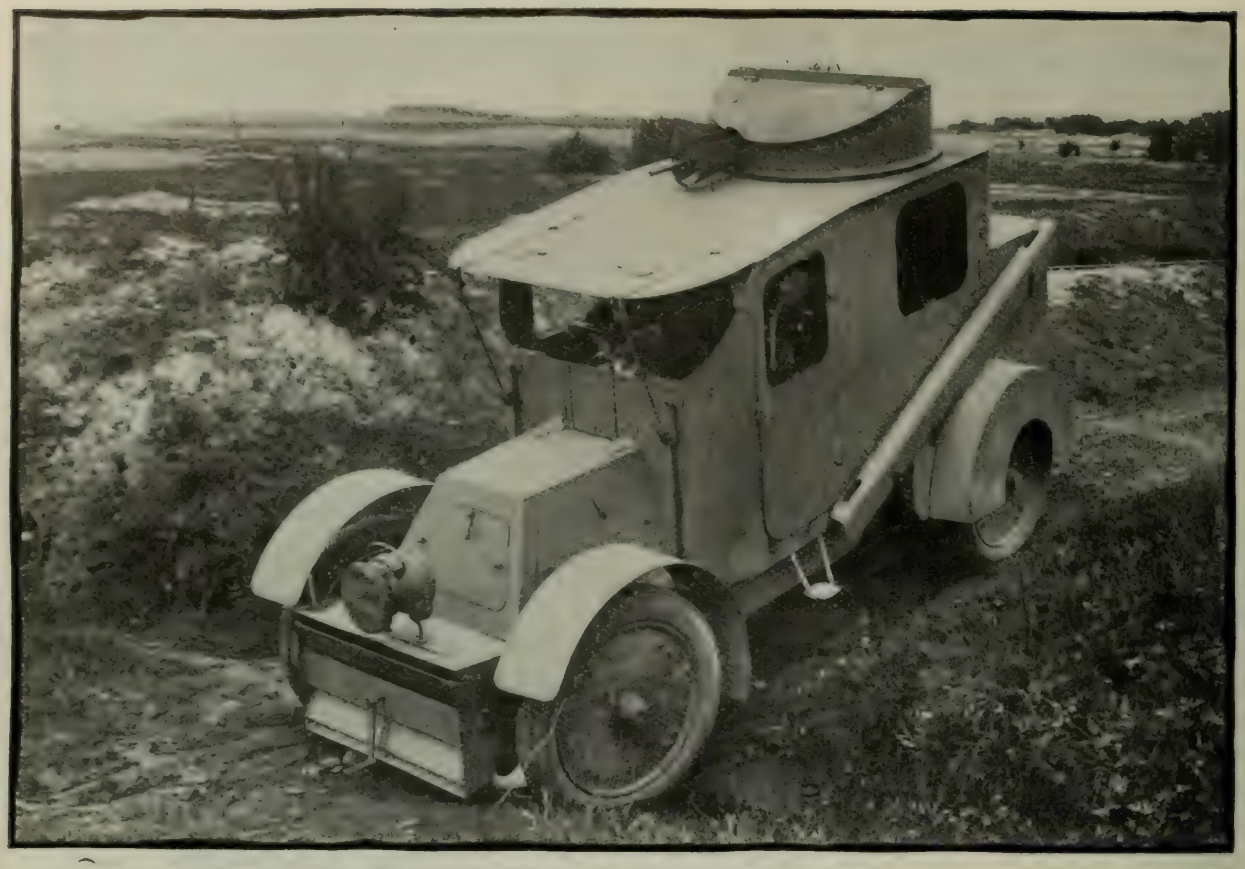
There are also determined partizans of the Government without arms—Government officials in the middle and higher ranks, large and small landlords, the merchants of the towns, village usurers and shopkeepers, petty traders who wish to get rid of their business rivals among the Jews. But, as the elections have finally proven, it may be doubted if the Government's unarmed supporters number all told, another million men.

The rest of the people, not less than twenty-five million fighting men, are opposed to the Government and gradually joining in the war against it. They are fighting men because nearly all have had four or five years training in the army and several millions have been thru the recent war. They are opposed to the

IMPERIAL GUARD. COSSACK OF THE URAL.

Government because the Government has taken a clear and final stand against their wishes for a political and economic revolution, as expressed in the last Duma, and is using the most violent and savage and murderous means to repress their discontent. What part of the twenty-five million are already prepared to go to war, *i.e.*, to risk their lives for the cause, it is impossible to say. Certainly practically the whole youth of the cities and towns, probably the overwhelming majority of the young peasants as well. The older men, less valuable and slower to act, are fast moving on the same way. If the present conditions continue there is no doubt that a large part of the twenty-five million will soon be ready for the revolution's service.

What is lacking to the revolution is not men but means. It is here that the disparity is most glaring. The Government gets every year several hundred million dollars from foreign financiers, and will doubtless continue to get these sums at whatever cost. The Government has control of hundreds of forts and arsenals thruout the land, of innumerable rapid-firing cannon and machine guns. It monopolizes the use of the telegraphs and railroad lines and will continue to monopolize them even in the hight of civil war. The revolutionists can always destroy communication—the organization to use them is lacking and must remain lacking until the Government is already overthrown. Even when all the lines are down the Government will continue to have the use of its wireless system against the revolution.



The Government is not only highly organized, but it is organized especially to fight the revolution. By the side of the first Government a second has grown up. There is one organization of the railroads in time of peace and another organization in time of insurrection. In time of insurrection the roads are on a war footing. Every workman becomes a soldier, every superintendent an officer. So with the telegraphs, the post-office and the police. As to the army, machine guns are within a few minutes of every public place, spies infest every restaurant and railway station, Cossacks are on the alert for the few cents of extra pay they get for every hour of "service against the internal enemy."

Against such an array of organization and force what can the people do? There is no hidden answer to the question, no possibility of an easy escape from the colossal tragedy of the situation.

SUB OFFICER OF THE PREOBRAJENSKIY GUARD.

The people must be ready to die. When they are ready to make the necessary sacrifices of life and everything that life contains, then only can they hope for freedom. Already they have given up tens of thousands of lives. No one knows what bloodshed will be the price

A WAR AUTOMOBILE.

Useful against rebellious peasants. The Government has all the machinery of modern warfare and has especially adapted it for fighting the revolution.

of victory. A quarter of a million soldiers were sacrificed in Japan. This is a war of infinitely more importance to the land.

The war between the Czar and the people has already passed the first stages. The armies have taken up their position and the first skirmishes, in which the Government has been uniformly successful, have already occurred. Nevertheless, the revolutionists have gained a great advantage. With a mere fraction of their army mobilized and in the field, they are keeping busy the total available Government force.

For how many men of fighting age are subject to revolutionary orders at the present time? Probably two-thirds the city population, most of the miners and railway men, practically the whole people of the Baltic Provinces and of parts of the Caucasus and a few hundred thousand Russian peasants. In all certainly no more than a few million men—armed with a few hundred thousand revolvers and less than a hundred thousand rifles, financed with the few million rubles they have been able to steal, held together largely by purely local organizations and limited in their field of action to a fraction of the land. The workingmen are able to gather together in mobs of several hundred or several thousand men. Without arms they cannot be able to do much active damage, tho it takes several large armies and numerous smaller detachments to keep them down. The guerrilla forces in the Baltic Provinces and Caucasus are composed of bands of only ten to a hundred armed men, but they destroy a great deal of Government property and keep two armies employed.

The peasants' contingents are only beginning to move. The whole peasantry is daily growing more bitter against the Government, but hardly a tenth part have yet become soldiers of the revolution. Yet look what an army they have engaged. The Cossacks and rural guards in the country probably number not less than two hundred thousand mounted men. If the peasant's revolt continues to spread, if ever the dozen most revolutionary provinces of the Volga and the South rise at the same time,

this force would not be a fraction of what would be needed to keep the peasants down. It is at this moment that the railway union has agreed to strike and with the aid of the peasants to destroy the bridges and tear up the ties. The national movements in Poland, Finland, the Baltic Provinces and the Caucasus would redouble at such an auspicious movement. The Czar's loyal army, that is the part that is loyal, would do well if it held the strong places and a few important lines of communication. The country districts would have practically emancipated themselves at the outset, the cities would soon become centers of mutinies and barricades and all Russia would be covered with the same guerrilla warfare that has been waging for the year past on the borders of the Black and Baltic Seas.

It may well be a protracted struggle for it is most likely to end as it begins, as a guerrilla war. The revolutionary forces will strive for better organization, more arms and more financial backing—but they will long remain relatively disorganized and poor in both money and guns. The size of the guerrilla bands may increase from ten to hundreds or even thousands, it will certainly be long before anything like a regular army is in the field. The basis of the operations of these bands may spread from a dozen outlying districts to a large section of Russia itself, the hundred thousand men now secretly or openly under arms may increase even tenfold; the Government will continue to count successfully on all or a very large part of a centralized army of nearly a million men. It will continue to hold for a long time nearly all the strong places, the cannon and the machine guns; the wireless telegraphs will remain; the railway soldiers will hold and operate the main lines and repair them sufficiently at least for the transportation of troops.

There is possibility of appalling bloodshed. No people is more lavish of lives than a peaceful people whipped and driven to revolt. If the Czar is determined, no man can see where the bloodshed will end.

In 1861 the United States, a nation of 30,000,000, fighting over the freedom of a few million blacks, and the preservation of the Union, lost a million men. In great Russia, fighting over the freedom of 140,000,000 human beings and for the birthright of a nation, should give the lives of a million or several million. could we fail to understand?

ST. PETERSBURG, RUSSIA.

There's Necromancy Still

BY CLINTON SCOLLARD

THERE'S necromancy still!
The rathe marsh-marigold
An Ophir makes of yonder oozy mould;
Slim branches erewhile stark and dark and chill—
The wild wayfaring-tree—
(Oh, wondrous wizardry!)
Offer a fragrant Hybla where the bee
May drink his greedy fill!
Care must attend whatever path you tread,
Lest your foot crush some fair and fragile head,
Shatter white innocence, leave budding hope
Bruised on the dewy slope.
But yester night
All the wide earth lay barren of delight
That now is splendor-bright before the sight.
And so, my masters, say whatso you will
There's necromancy still!

CLINTON, N. Y.

A Woman's Reason

[It is a condition, not a theory, that confronts the modern woman in regard to the question of the size of the family. The following frank and authentic statement of a New York wife, of the reasons why she has determined to have no children, is worth consideration, because it is typical of a large and increasing number of households.—EDITOR.]

CIRCUMSTANCES render it necessary for one female relative to live with my husband and myself. Our family of three occupies a flat of five rooms and bath. It is a good flat when one gets into it; that is, it is light and airy, and has gas range, steam heat and hot water. But the house is badly kept. The halls are dirty, and the street is a dirty and depressing one. We cannot afford to live in a clean and pleasant place on Manhattan, and to leave Manhattan would be an extreme inconvenience to both of us. We pay $21 a month for this flat, and I do not think there is a cheaper one on Manhattan with the same conveniences; and any one knows that life in a New York apartment house without these conveniences is a distinctly unbearable thing.

It costs us $60 a month to run the flat. One-third, as I have shown, goes for rent. Our food does not average more than a dollar a day the year around for three of us. The other $10 a month pays gas and ice bills, and running expenses incidental to housekeeping. We do all our own housework, including cleaning and washing, with the exception of my husband's linen and a very occasional white waist for myself, which go to the laundry. It is not more than three or four times a year that a guest eats a meal with us, and then the meal is very little better than we would have had alone. I do not see how we could reasonably cut down our housekeeping expenses, unless it were by eliminating the laundry and the guest three or four times a year; and the saving would be slight and quite out of proportion to the deprivation. We have tried kerosene as an illuminant, but there is no saving in it. We have even tried candles, but we cannot read or write by them. Our tastes in food are very simple, but we feel that the few simple things we eat must be of good quality.

Now, my husband earns $60 a month, the amount of our household expenses. This leaves us nothing for clothes, furniture, medical attendance, carfare, travel, reading matter or amusements, and it leaves us not a cent to save. It is my earnings which cover the latter. We don't divide it just that way in paying the bills, but that is what it amounts to. We have a few hundreds of dollars in a savings bank; at this writing $300, tho it varies from time to time. We keep up the premiums on $3,000 endowment insurance. We have accumulated one little house in the country, which brings us in at the best $150 a year, and when we have poor luck with tenants, much less. We take one little trip a year when our vacation comes. We possess a library of perhaps 300 volumes. We go out six or eight times each summer on boats to neighboring beaches for a breath of fresh air. My husband adores the opera and I love the theater, but we have cut these two things entirely out, feeling that we could not afford them. To do the work that earns these things, I have to present a good appearance. My clothes are part of my capital. I must keep one dress of decent make and quality on hand. My shirtwaists, shoes and gloves must be neat and fresh. My clothes must be clean. We speak of cleanliness as such a simple thing, attainable by anybody, when on the contrary it costs time and

money. The white waist of summer, which presents such a simple, cottage effect—how much it costs in laundry bills. A silk waist to be made presentable must go to the cleaner, and that costs a dollar each time. I cannot clean either of these things myself in a satisfactory manner. Each process is a trade by itself. I do better to stick to my own trade, and earn money to pay the laundress and cleaner.

Then there are so many expenses which come upon people like us which tax us heavily, which add nothing to the joy of life, and yet which we would be perfectly miserable without. I have had to have expensive work done on my teeth and eyes. It certainly did not make me happy, but I could not get along without it. Doctors' visits to the house cost at least $2, often $3, sometimes $5. These are big bills for people of our earning capacity to pay, but I do not see how we are to get on without them. I certainly cannot go to a dispensary; at least, I will not. Neither will I resign my one bit of travel a year. I do not consider it an unreasonable demand that I should see some portion of the earth's surface aside from Manhattan Island.

Then there is the matter of savings and losses; synonymous sometimes. If we could go gayly on and spend all I earn with a light heart, life would be an easy thing. But the vision of the possible years beyond our productive period is ever with us. If we could be sure of dying in the harness—but no one is sure of that. The necessity of providing for old age hangs over us like a pall. It has come to that point that I never do anything that costs money for the simple pleasure of it, but only if I know in addition that it will help to keep my body and mind in good shape as a working machine. I have tried cutting down on food, on vacations, on the little boat trips, and I have suffered and lost money by it.

All this sounds pitifully small, no doubt. But if we had not considered every penny we would not have had the little savings we have. I had a deskmate once who used to laugh and jeer at my penurious traits; a brilliant, attractive fellow, who had $30 a week for years.

"If you have only one dollar in the world, spend it like a king," he used to say; and he used to make me feel that I was a poor, mean, little person. Well, I helped to bury him. When he died he left his wife actually without a cent in the house. We people in the office—not the firm—paid the funeral expenses and gave the widow a little sum for a starter. What she did when it was gone I don't know. She had never earned a dollar in her life. I don't know what becomes of such women.

If my husband and I were a different sort of people we would play a different and bigger game. We tried it. My husband started in business for himself. We put our savings into it, and lost them. I would like to tell some time some of the things we learned in that episode as to a man trying to start a little individual business of his own in these days. Then I put my own savings into an investment that I believed there was money in. My judgment was good. There was money in it—for some one else. Since then we have decided that we can't play the game. We might learn, if our capital were sufficient to pay the tuition fees, but it is not.

Twice in my life relatives have played in harder luck than I, and I have gone to the rescue. Common humanity and the tie of blood demanded it. It cost me $200 one time. In the other case, scattered over several years, it amounted to $500. Perhaps I seem to be peculiarly unfortunate, or an easy mark. All I can say is, if any worker who, like myself, has never lost a job and always had a little money laid by, has lived his life thru without having to help out a relative some time or other, he is either a very selfish or a very lucky man. Whole bodies of wage-earners, whole populations of them, would come upon public charity if relatives did not help in times of sickness, misfortune or non-employment.

One thing that drives the pinhead of economy into my soul is that I never feel sure that my savings are saved. A savings bank failed one time, and did me out of $200. It was every cent I had in the world, excepting what was in my last pay envelope. Had I encountered any emergency just then—sickness or loss of a job—I might have come to charity. I have never felt safe since. How can I know when a bank is going to fail? I

cannot know the inside affairs of banks. The president of that savings bank went to Europe just then, and took his whole family. I suppose my two hundred helped pay the fare of one of the children part way.

Years ago I took out endowment insurance to run for twenty years. I thought I was doing a most wise, prudent, far-sighted thing. Now, I don't know. I feel no assurance that I will ever get my money back. It all adds to that dreary uncertainty about old age. It is so hard to save anything, and then you aren't sure it's saved. If the Government would have the decency to give the poor a postal savings bank, where we could put our poor little pennies and feel that they were safe as long as the United States Government stood, it would remove one weary anxiety from our lives; give us one bit of solid fact for the future.

Then, as to old age pensions. No man has ever employed me except for one reason—because he made profits off my labor. For years I have scattered profits thru society, and I shall do it for years longer. Yet at the end—a little bad luck, a combination of circumstances, may leave me only the poorhouse. If I could know that in case I needed it there would be an honorable pension, paid in private, bearing no more odium than the G. A. R. man's pension—it would rob old age of its terrors.

In addition to the uncertainty about the end of it all, there is the daily uncertainty of the wage earner's life. My husband and I have been very lucky in one way. Neither has ever had a long or expensive illness. But there is no certainty about that. The relative who lives with us was checked in the very midst of a successful career by a sudden and complete breakdown in health. A year's—even six months'—illness for one of us would tax our resources heavily. Then, no one knows when he is going to lose his job. I knew a woman who was honored and trusted in a very good position, who came back from a vacation to find the niece of a director in her place. I knew another who worked twenty years for one firm, to find in her pay envelope one Friday a printed slip, "Your services are no longer required"—just that and nothing more. They had found a bundle of fresh youth and vitality to put into the place at a lower salary, and sent her to the scrap heap with no more compunction than a piece of old iron. One never knows when that sort of thing is going to happen. It comes like a thunderbolt out of a clear sky.

Now, how, in the place of all these things, can I afford to have a child? I want a child. I want it very much. I have wanted it for years—first, because I love my husband, and, then, because my maternal instincts are strong. I believe the maternal instincts of the majority of American women are strong. I know many single women, in business and the professions, who have confided to me personally that they would like to have a child of their own. The books of the Children's Aid Society and other placing out societies, with their records of thousands of children adopted, loved and cared for as the family's own, prove maternal instincts of wonderful strength; for no man would adopt a child unless his wife wished it, and the maternal instinct must be much stronger to care for an adopted child than for one's own. My husband and I have talked of that baby; that baby we have never had. We have discussed its possibilities, its education, its future. But we have never dared to have it.

In the first place there is the cutting off of my earning capacity for an indefinite period, the contraction of our income by more than half, at the very time when heavy extra expenses were certain. That is the first obstacle blocking the road. In all the world I have found only one group of statesmen that has taken note of this obstacle. In little Denmark they passed a law that no mother should return to work till one month after the birth of her child. Other States have passed that sort of law. But Denmark added that the State should pay the mother the wage she would have earned for that month. It is the first shred of evidence I have noted that any statesman thought the work of a mother in caring for her child might be of more value to society than her work in a factory for the same period.

But a month would not be enough for me. Society would have to pay me my salary at least eighteen months if it desired me to bear and rear a child for its benefit. I should want to nurse my own

child and care for it myself during its first year of life at least. If the maternal instincts are ever to receive gratification sweet and full, it must be while the child is still a little helpless infant, still almost a part of herself, still in her arms and at her breast and almost dependent on her for life itself. It is that vision that has drawn and haunted me time and time again. I never see myself with a grown up son or daughter; but I feel that baby form in my arms sometimes in dreams, and wake up with the hot tears on my lashes.

I really think that society would get the worth of its money were it to make me that compensation. My services have commanded a good salary for quite a number of years. Yet a man could do the work I do as well. I ought to be doing something better. But society demands that I incur heavy expenses and heavy loss of income in order to render it a superior service.

Added to our present uncertainties would be uncertainly in regard to my health were I to have a child. Owing to changes in medical science women do not die in childbed often nowadays, but they often leave it with ill health fixed upon them. In my small circle of personal friends I have had three who suffered years of ill health from childbearing, tho they were strong, healthy women when they married. Civilization is full of diseases unknown to the barbarian; tuberculosis, dyspepsia and what not. Civilized man cannot digest his food right or keep his full complement of lungs. Is it strange that the most delicate and complicated of all physical functions—"the master thing in life, birth"—should be accompanied by disturbance and danger? I do not say I would lose my health. But there is the possibility of it; the possibility of several years' loss of earning capacity, with a child added to our expenses.

It is astounding, it is degrading, it is unbelievable, it is true, how our lives, our thoughts, our viewpoints, are shaped by money. Humanity is supposed to shun pain and suffering. I would encounter certain pain and suffering, possible death and disablement; I would run to it light as a summer day—repaid by that exquisite consummation and flowering of our marriage—could I be freed from these wretched, miserable, hateful financial anxieties.

And here I hear some impatient listener wish a murrain on all economic independence of women. "If this woman were living on her husband's salary," he snorts; "if she had not to sacrifice her income to have a child, she would have one."

But no, kind friend. If we three had to live on my husband's income, I would never contemplate maternity any more than I would suttee. It is only because I am able to increase our income that I contemplate the thing as a possibility.

"You had no business to marry a man of such low earning capacity," he comes back.

But if I had not married I certainly should not have had a child; and if the masses of women marry at all they must, perforce, marry men who are not money-makers.

And then, let us consider the child itself. If only I did not know so well what a child should have! I reflect on my own life and how little I have accomplished, and how it has sapped my energy and vitality to accomplish that little, and then look back to the way my childhood prepared me for it. A great, roomy country house, all outdoors to play in, horse and carriage in the barn, not a mouthful to eat that was not raised by us or our neighbors—all those I had, and not one of those can I give my child. A stuffy little flat, air which serves well enough for adults with strong country built constitutions but which no baby should breathe, a filthy street to play in—that is what my child would get. I could not afford to keep it in the country even during the summers. I do not see how I could possibly start my child in life with the reserve fund of strength and vitality that I started with myself.

And last and most clinching of all the arguments, I don't see how we could educate the child properly. I don't see where we would get the money. And you may be very sure of one thing. I, who all my life have felt the lack of a better preparatory training than I had, will never launch a child with still less than I had myself.

"It's lucky," growls some one, "that all women don't figure it out as you do, else the world would cease to be peopled."

Few of them figure it out and set it down on paper as I do. But they are *acting* it. The house I live in is inhabited by the common or garden variety of Americans, trying to be happy tho married on from $60 to $100 a month. Among the fifteen families there are fourteen children, less than one to a family. Six of these children are in one family, four in another. The whole fourteen are contained in five families, leaving ten without any children at all.

It is said that 3 per cent. of the people in this country own 20 per cent. of the wealth. Another 9 per cent. hold another 51 per cent. of the wealth. The lack of children in this 12 per cent. of the population would not affect the total very much. But the American wage earner is ceasing to have children. There's the rub. The 88 per cent. of the population in whose hands rests that other 29 per cent. of the wealth is ceasing to turn out big families, and we begin to hear of race suicide. Our statesmen presume to rebuke American women for not doing their duty. "Why," I can hear one exclaim scornfully, "there are people who would raise whole families on $15 a week, yes on $10 a week." Now hear the answer of one American woman, of as old American stock as there is. Rather than bring children into the world as the women of our foreign quarters do, without one chance or hope for a decent start in life, destined from birth for wage slavery and exploitation or worse, I would commit suicide. This is a deliberate and truthful statement, and I believe it would be endorsed by thousands of the best American women.

I have seen it argued in this discussion that as it is a man's duty to risk his life in war when his country needs him, so it is the woman's duty to provide citizens for her country when it needs them.

Let us admit that, for the sake of argument. But there is no lack of people to do the work of this country. Instead, there is a constant mass of unemployed seeking work. Every skilled laborer, every intellectual worker, knows that there are plenty standing ready to snatch his job the minute he looses his grip on it. And the Government continuously lets in more to compete with American workers, to compete with my children should I have any.

Furthermore, if the country is so much in need of children, let it go save some of those already born. The babies die like spatters in the tenements, 50 per cent. of all that are born, it is said. There are plenty of nurses and doctors, good food and clean country air to save these babies, if society chose to pay. But society will not pay, either in wages or taxes. It prefers to go on the principle followed by nature with those fish mothers which deposit great superfluity of spawn that enough may survive to preserve the species. But the human mother is no longer merely an animal. She has begun to develop reason. Are the bodies of women to be regarded merely as baby machines, to supply the losses which civilization creates by its foul mismanagement? If society wants more children let it go save some of those already born before it calls on me for more.

The great Napoleon, once being asked what France needed more than anything else, replied with that epigrammatic pomposity with which great men can dismiss the affairs of the world, "More mothers." I have seen that remark quoted by a clergyman against the American mother in the present discussion.

Now no schoolboy would ever claim that Napoleon had any deep concern for mothers, for children or for the welfare of France itself. Woman to him was the breeder, who furnished him with the raw material he used. He wanted more boys for cannon food.

Now, gentlemen, You Who Rule Us, we are your "wage slaves," my husband and I. You do not have to hale us to work. We go humbly and ask for a job, knowing some one else will take it if we do not. You Who Rule Us may take our savings and go to Europe with them, or do sleight of hand stunts in insurance and railroading with them, so we will not know where they are. You may raise our rents and the prices of our food steadily, as you have been doing for years back, without raising our wages to correspond. You can refuse us any certainty of work, wages or provision for old age. We cannot help ourselves. But there is one thing you cannot do. You cannot use me to breed food for your factories.

NEW YORK CITY.

SAN DIEGO FROM POINT LOMA.

San Diego

BY THEODORE VAN TYNE JOHNSTON

THE history of San Diego may be divided into three periods: First is the year Father Junipero Serra crossed the line now dividing the United States and Mexico and established the first of a series of forty-one missions, followed by Spanish occupation. Prior to this beginning of a civilization Cabrillo had entered the bay from the Pacific in 1542, and, finding the harbor so safe and beautiful, named it San Miguel. Sixty years later, Vizcaino, commanding a Spanish exploring fleet, sailed into the same bay, whose name he changed to San Diego de Alcala, in honor of his flagship.

The first mission named after the land-locked harbor of so much beauty was only the beginning of the finally completed chain of missions, which were about a day's journey apart, until the extreme northern one—near San Francisco—was reached, so that the traveler in those early days could always rely upon food, shelter and protection when once within their thick adobe walls. The good padres labored among the Indians, casting here the first seeds of Christianity, but after the fall of the missions and subsequent departure of the priests of the Order Franciscan, they relapsed to their former state of semi-savagery.

The common supposition that the decline of these missions was due to the advent of the Americans is altogether wrong. Spain, finding that the Church in this country was growing too powerful, passed the "act of secularization," which took away from the friars their vast holdings of fertile land, only allowing them to retain their buildings and a very limited amount of ground. Many of the padres returned to their native Spain, while others remained to starve at times half to death—notably the case of the good friar of San Luis Obispo, who would not desert his post and labors among the handful of the faithful who had remained with him, and shortly before his death fell fainting while administering the sacrament one day at the altar, from sheer exhaustion caused by hunger. The beautiful romantic tales of the old mission days are most touching and the pathos of them lingers to this day.

The second period was the advent of the Americans, who did nothing whatsoever for the old civilization in any way, except, possibly, to give it another kick on its downward career. The Indians were unemployed and finally driven back to the barrenness of the mountains, where a miserable remnant of them dwells today, and mostly in a degraded condition. The comparatively few remaining rancheros dwindled away after mortgaging their great tracts to the more enterprising "Gringo," until finally, with one or two exceptions, none were left. The result of the second occupation, as years passed, was a steady growth notwithstanding—the worst possible feature of it being, perhaps, the days of the so-called "boom," when the town seemed given over to the real estate sharks, who at-

SAN DIEGO NORMAL SCHOOL.

tempted, at the time, a complete domination. Few cities have suffered more than San Diego from lack of adequate railroad facilities, and when the announcement was recently made of a new road extending directly thru the immense fertile country back of here, the project was hailed with signal delight by every inhabitant. To every merchant, manufacturer, banker, land owner and resident the hope for years had been for an Eastern connection traversing the wonderfully fertile Imperial Valley. It is about to come, and it means an opening of the back country, so fertile and fair, where practically millions of acres have lain dormant for all

THE FIRST MISSION IN CALIFORNIA. NEAR SAN DIEGO.

time, waiting for the hand of man to divert the waters of the limitless Colorado River for irrigation. With the railroad realization, the opening of these vast tracks of arable lands is assured. The tremendous products of all this country, made so perfect by the conjunction of naturally fertile soil, a semi-tropic sun and an unlimited water supply, will find their way to the only logical outlet—San Diego. Even before the announcement of the building of the railroad the town has steadily advanced. The modern office building has gradually replaced the old-time structure, the residence section in a few years has vastly improved, a hotel is in course of construction costing $800,000, various improvements are taking place in the streets and thorofares and parks, and the city is assuming a metropolitan air.

There is to be a new City Hall—a renaissance of civic beauty is promised, while the water front, roads and all public buildings are to receive attention, showing that the esthetic interests of the city are keeping pace with the commercial and other interests. When the good news of the coming railroad was published there was a natural elation, for this could only be a forerunner of additional prosperity. Better opportunities for a progressive enterprise rarely present themselves than here at present. The field is too wide a one to be accurately described in one communication, but a preliminary description of the resources of San Diego as they exist today can but be of interest.

COURT AT DEL CORONADO.

In point of maritime location San Diego Bay and Harbor present features of such important significance that even a casual observer—a tourist, for instance—who may have entered the chief ports of the world, would exclaim: Ideal! To the more interested one the facts that exist regarding this port are apparent from the time the bar

outside in the ocean has been crossed, grim Point Loma passed, and farther on thru the perfect harbor to the wharves reaching out in the narrower part of the bay. After Battery Point, a mile and a half inside from the point, to the right stretches the long, crescent Coronado Beach, with its many beautiful dwellings and famous hotel seen many miles out at sea, while at the left lies Fort Rosecrans —the harbor's guard—and a mile from the military post is the quarantine station, from which a half turn in the bay leads directly to the city. Those who have visited the Bay of Naples see at once a remarkable resemblance to it as they enter this California port. The Coast Range towering in the background and extending down along the Mexican or Lower California coast impresses one as does the Italian shore at that point.

CHEROKEE HEDGE.

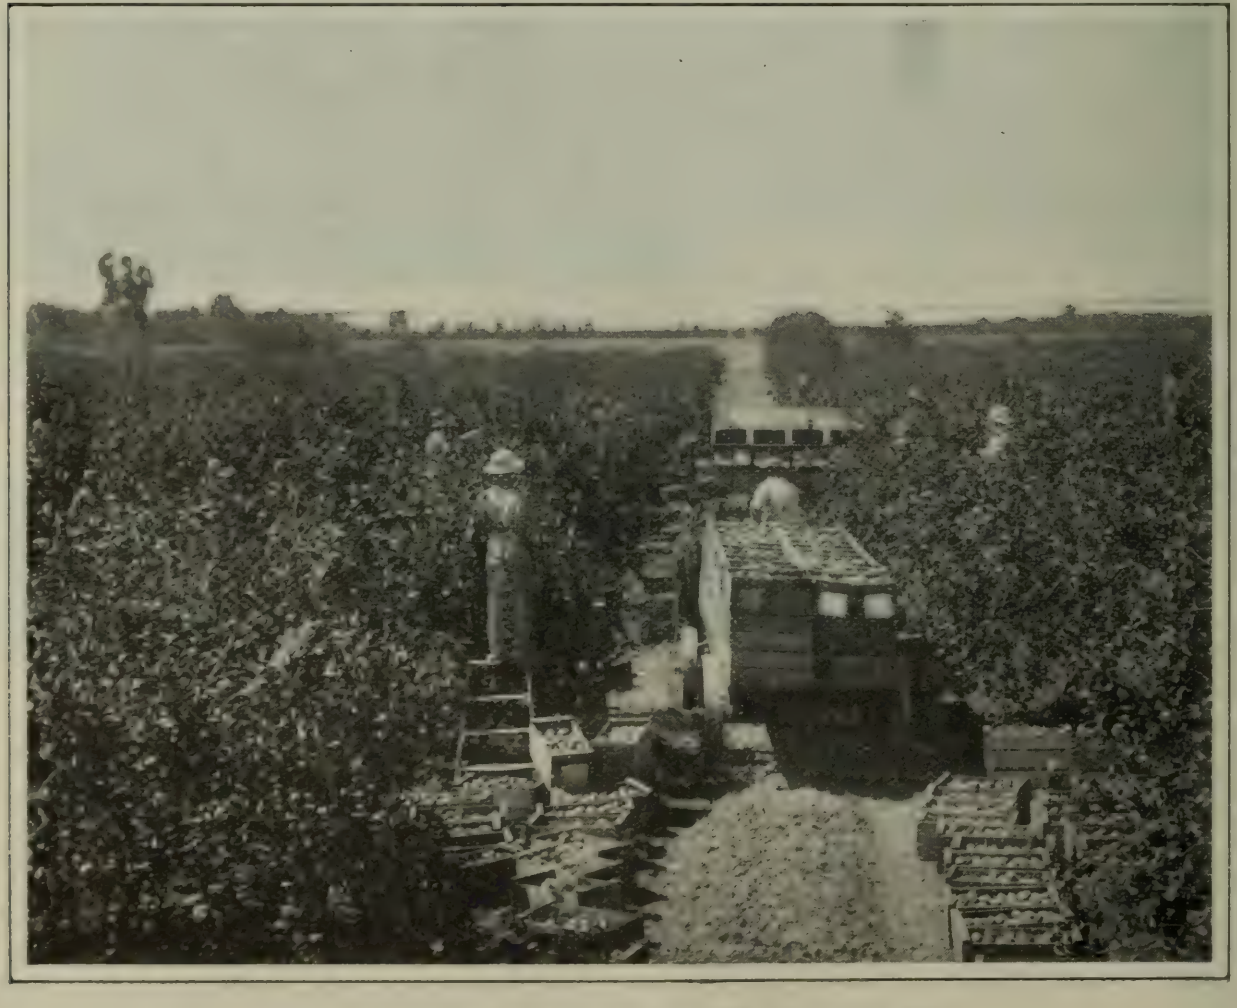
Now, in regard to San Diego, there is, of course, but little one does not find in all American cities having in the neighborhood of 35,000 inhabitants. There are four national banks, two savings institutions, one trust company and one private bank, having a combined deposit of about eight millions, together with a clearing house. Churches are numerous and the edifices fine, and every denomination represented. All California is noted for its schools and a most up-to-date school system, and San Diego is in no way backward in this respect. The school buildings are ample, light, airy, sanitary, commodious and well constructed—the State Normal School, with its beautiful building, being a feature. The usual Carnegie Library, occupying a central position, is thoroly equipped. The main park of 1,400 acres overlooks most of the city, Coronado, Coronado Islands in the Pacific Ocean fifteen miles distant, and all the bay. Landscape architects of great renown have been employed in the improvements of this naturally beautiful park, with its deep canyons and its sightly mésas and hillsides.

To the various parks and pleasure grounds, as well as to the beaches, a trolley system is in operation that is unexcelled anywhere; also giving easy and rapid transportation to all the leading resorts.

There is a ferry to Coronado Beach, where in summer a village of white tents and thatched cottages appears, as it were, in a night, and the occupants lead there during the season a life of gayety and pleasure.

In another direction and within the city limits there are three beaches—Pacific, La Jolla and Ocean—all affording many attractions. In the back country within a comparatively short distance is found Lakeside, its pretty lake surrounded by towering hills, among which are many thermal springs.

With all the many attractions to commend it, the one thing that has held San Diego back for the last twenty years has been the lack of a direct Eastern railroad from here to the Colorado River. With the finest and safest harbor on the Pacific Coast, with one of the finest climates in the world, with an agricultural territory immediately surrounding it and extending back 200 miles, and with an abundance of rainfall and other available waters for irrigation purposes, there is no reason why San Diego today should not have been a city of 250,000 except for the fact that it had but *one* transcontinental railroad—a railroad which necessitated the freight going north 126 miles before it could start on its eastward course. Now that the road will be built from here to Yuma, Ariz., a large portion of the richest back country will be opened. The building of this road will not only open the gates of San Diego Harbor to the entire Pacific Coast trade, our Pacific possessions—the Hawaiian Islands and Philippine Islands, as well as the Orient—but it will also make of San Diego the distributing center for a great portion of Southern California outside of the immediate back country—the greater portion of Arizona, New Mexico and the western portion of Texas. The recent opening of the Tehuantepec Railroad is a big factor in San Diego's growth, as it enables it to bring goods to this port for distribution from New York in one-half the time it took before and saves one third the freight rates. With the opening of the Panama Canal even greater results may be obtained, San Diego being the



CORONADO BEACH

first port of call in the United States north of Panama, and making it the only logical port for supplying all the above-named territory.

The rainfall in and around the city of San Diego is very light, averaging about ten inches each season, which is an advantage from a climatic point. Forty miles back the topography of the mountains and their elevation are such that the average fall is about forty inches each season, which is far greater than any other section in the southern portion of California. A great deal of this water is held by large dams in the canyons, affording at the present time enough in the reservoirs to supply the city for a period of four years without another drop of rainfall. Other dams in other sections of the country supply the farming districts for irrigation purposes, and more are under construction. In all these there are 15,000,000 gallons stored at the present time. There are underground streams and rivers in various sections surrounding the city and immediate back country which give ample supply when tapped, while in the eastern portion of the country hundreds of thousands of acres are already being supplied with water from the Colorado River, and millions more can be as fast as settlers locate and develop.

From a health standpoint statistics prove that there is no region freer from seasonal diseases than here. The summer diseases of children are remarkable for their absence, and surgeons have found that wounds, accidental or surgical, heal with unusual rapidity, which may be attributed to an aseptic condition of the air. At some distance off shore in the ocean there are vast beds of kelp, and it is possible these beds convey the properties of iodine to the air swept over the country when the regular sea breeze comes in. One physician reports as follows:

"I have attended many cases of sthenic pneumonia in Northern France and the United States and therefore know the disease when I see it. I have seen but two cases of that particular kind here in thirty years."

ORANGE PICKING WITHIN THE CITY LIMITS.

THE TENT CITY ON CORONADO BEACH.

Of fevers there are apparently none. Sporadic cases of typhoid have appeared from time to time, but so remote they could hardly be called occasional, and invariably traced to a source away from the city. An epidemic of any character has never been known.

To the most fastidious the social conditions are such that would meet with the approval of any one. Literary clubs are numerous; musical organizations do everything possible to encourage the study of music, and do all they can to bring noted musicians here; there is a large and flourishing art association, in which the greatest interest is taken by the leading citizens as well as by the local artists. There are town and country clubs, and yacht and rowing clubs have unusual facilities. The roadways for the automobilist are really good, and a large bond issue has just been voted upon to further improve the highways. Today finds the people of San Diego in accord and as a unit working together for the best interests of the city and surrounding country. That their efforts will be happily rewarded there is not a doubt.

San Diego, Cal.

Hawthorne's Tales of Old Greece

BY ANDREW LANG

IN December and February, 1906-1907, it was part of my business to retell some ancient Greek stories for children of uncertain age. My pace was not so good as that of Hawthorne, who began "The Wonder Book" in June, 1851, and finished it in the first week of July. "It has been really a task fit for hot weather," he says, "and one of the most agreeable, of a literary kind, which the author ever undertook." In a brief preface Hawthorne gave his opinion of his materials, and of the freedom with which a modern narrator may handle them. "No epoch of time can claim a copyright in these immortal tales. They seem never to have been made . . . They are legitimate subjects for every age to clothe with its own garniture of manners and sentiments, and to imbue with its own morality." In "Tanglewood Tales" Hawthorne puts the same opinion into the lips of Eustace Bright, a young student, the narrator. "An old Greek has no more exclusive right to the tales than a modern Yankee has. They are the common property of the world and of all time. The ancient poets remodeled them at pleasure, and held them plastic in their hands; and why should they not be plastic in my hands as well?" Eustace Bright goes even further: "The moment you put any warmth of heart, any passion or affection, any human or divine morality, into a classical mold, you make it quite a different thing from what it was before." Eustace then accuses the Greeks of putting stories, which are the property of the human race, "into shapes of indestructible beauty, indeed, but cold and heartless."

Eustace, no doubt, expresses Hawthorne's own critical opinion, which contains much truth, but not the whole of the truth, and, moreover, is unjust to the Greeks. Hawthorne sees, as Fénélon saw before him, that the Odyssey, and the tales of Perseus and Theseus, and of the Golden Fleece (for example) are arrangements, by prehistoric and historic Greek poets, of incidents in the universally human stock of Märchen, or, as we say, fairy tales. The poets gave a local habitation and a name to each of the characters, who, in traditional popular tales, are anonymous and not localized. The poets threw in the agency of their own gods, and the social, moral, and political manners, customs, and laws of their own time: a time of small states ruled by kings. In re-telling the tales, Hawthorne practically shelves the gods, turning, for example, Hermes into Quicksilver, a humorous, potent, eccentric playfellow of Perseus and other heroes. Hawthorne tries to restore the old fairylike essence to the stories, which, in Greek poetical hands, became epics; and Hawthorne's humor and morality are those of the Yankee of 1850, as he says. No doubt he had a right to adopt this method, and to follow just such various Greek versions of each story as he happened to prefer.

My own experiences in regard to his versions are rather curious. At about the age of ten I looked into "Tanglewood Tales." I did not like them. To speak of Hermes, or Mercury, as "Quicksilver" seemed to me a dull and irreverent attempt at a joke; indeed, I could not endure the humorous parts of the stories, and gave up reading them. The modern children in the interludes, named Primrose, Huckleberry, and so on, bored their little modern contemporary. I never looked again at Hawthorne's versions of the Greek legends till yesterday (Febru-

ary 28th, 1907), after I had finished my own retellings; and then I read Hawthorne all thru the evening, with much enjoyment. The little boy of ten was a more severe critic than the old boy. The little boy, about 1857, was as fond of the same stories told by Kingsley, in "The Heroes," as he had been averse to Hawthorne's manner of narration. Without knowing it, Hawthorne missed the taste of childhood and hit that of age.

Let us take Hawthorne's tale, "The Gorgon's Head," the story of Perseus. First I ought to remark, in defense of the Greeks and against Eustace Bright, that we cannot fairly accuse the ancients of omitting "warmth of heart, passion affection, human or divine morality," and making the stories "cold and heartless." We have no Greek epic or tragedy on the adventures of Perseus and of Theseus (except in the Euripidean Hippolytus, passionate enough, but not matter for children). The old epics and dramas on Perseus and Theseus have perished; scarcely a dozen lines survive in quotations. We have only the barest bones of these noble legends, preserved by Plutarch and Apollodorus, or in brief late Greek notes on early Greek texts. In the story of the Golden Fleece, we have an epic, a late literary epic, academic, pedantic, but, as regards the passion of love in the heart of Medea, full of a glowing romance. The Medea of Apollonius Rhodius inspired the Dido of Virgil. Where we actually have epic poetry on the old legends, in the Odyssey, not even Hawthorne can add passion and emotion to the work of Homer; but Hawthorne only retells, in a manner very un-Homeric, the Odyssean story of Circe. In my opinion, when we have a full and poetical version of a set of legends, in Homer, Theocritus, Apollonius Rhodius, Quintus Smyrnæus, or in a Greek drama, we should in retelling the tales for children, add nothing of our own—least of all should we add modern humor of our own manufacture—but when we have mere dry analyses of the legends, as in the cases of Theseus, Perseus and Meleager, a modern may fill out the story *à son dézis*. But he should keep modern humor and morality out of his narrative, unless he is conscious of possessing the genius of a Hawthorne or a Kingsley, who "moralize the tale."

To return to Hawthorne and Perseus. Our ancient analyses of the legend seem to be a blend of two varying old epic versions, long lost: the incidents are familiar in the fairy tales of the world. First we have the King who tries to evade destiny. He has one child, a daughter, and he is fated to die by the hand of his grandson. He, therefore, shuts his daughter, Danæ, within a house of bronze. She, however, becomes mother of Perseus, by Zeus, and, as her father does not dare to shed kindred blood, he exposes mother and child in a *larnax*, on the sea. Hawthorne omits all this factor in the story. "Some wicked people put Perseus and his mother in a chest, and set them afloat on the sea"—for what reason we are not told. Kingsley gives the true story, without bringing a blush to any cheek. Hawthorne follows one Greek version as to the reason for which Perseus sought to win the head of the Gorgon; but he describes Hermes and Athênê, the divine allies of Perseus, in a humorous "Gothic" manner, while Kingsley retains the divinity of the divinè. Both versions are good: if Hawthorne be rather too much at his ease in Olympus, Kingsley is a trifle too didactic. Both authors, in their various manners, are good about the Three Gray Women, but Kingsley is poetic: Hawthorne, who names the Gray Sisters Scarecrow, Shakejoint and Nightmare, is grotesque in a comic fashion. Kingsley's rapid views of the geography of the flights of Perseus are Miltonic: Hawthorne makes no use of his opportunity. He certainly "scamps" the charming passages about

> "Them who in the gods' own garden sing,
> The lily maidens called Hesperides."

Indeed Hawthorne neglects the poetry which shines thru even our dry Greek scraps of analysis, but not in his picture of the aerial flight by night to the Gorgons' Island. He adopts the version in which Perseus shows little or no "self help," being accompanied by the two gods. Kingsley, rightly, I think, follows the legend in which Perseus fares alone. Hawthorne drops Andromeda, merely giving her a passing

mention; Kingsley amplifies this famous incident in a manner highly poetical. Hawthorne, necessarily, cannot introduce the final stroke of Fate, when Perseus unwittingly kills his grandfather with a chance throw of the disk, at certain games, for Hawthorne has left the wicked grandfather out of the story, and thus he omits the Greek moral on which all turns:

"No man can be more wise than Destiny."

In the slaying of the Minotaur I think that Hawthorne has the better of Kingsley, especially in the truly Hawthornian description of the voice of the monster. But when Hawthorne makes Ariadnê so moral and self-denying that she refuses to follow Theseus, and remains in Crete to cherish her old father, *there* we see "the Yankee," there we have a touch utterly un-Greek, and even inhuman. The passionate maid was not a self-denying modern heroine of a schoolgirl's novel. Neither Kingsley nor Hawthorne has remarked, what is true, that Minos, father of Ariadnê, desired the death of the Minotaur, tho, for sufficient reasons, he could not lend a hand to help the slayer. Theseus, having accomplished the adventure, was a fit husband for Ariadnê, and a Cretan-Athenian alliance of two maritime powers was concluded. However, this is history, not fiction; and now, thanks to Mr. Arthur Evans, we know that the legend of Theseus is only a fairy veneer covering much actual history, long forgotten, but revealed by the spades which excavated the palace of King Minos, wherein are many pictures of the Minotaur, executed about 2000-1700 B. C.

St. Andrews, Scotland.

An Example of Municipal Operation

BY JOHN MARTIN

[Mr. Martin is doubly qualified for writing about the new municipal ferry; in the first place because he has been for many years a writer and lecturer on municipal ownership, and in the second place because he uses the ferry every day in going from his home on Staten Island to New York.—Editor.]

AFTER a year's experience of the municipal ownership and operation of the ferry from Manhattan to Staten Island, two boroughs of Greater New York that are four miles apart, stock may advantageously be taken of the results.

During the year Tammany Hall has been in power, tho, since Mayor McClellan quarreled with Boss Murphy over the conduct of the campaign by which he was narrowly re-elected, the Tammany influences in the administration and on the running of the ferry have not been unrestrained. However, the city services have been handicapped with fully the average of the incompetence and petty corruption that infect American city governments. When the ferry service began its municipal career, the newspapers freely charged that Tammany would purposely wreck it to cast discredit upon municipal operation. That extremity of guilt has not been realized; but it must be conceded that the service has been conducted with no special advantages. An administration unhampered by a host of political heelers, and bent on running the government as economically as a private business, could have presented a far more favorable balance sheet.

How has the city acquitted itself? First, as to the technical efficiency of operation. The boats are much larger, handsomer and more comfortable than their corporation predecessors. They supply a seat for everybody, even during the rush hours, while previously, especially on the smaller of the arks that ran, great crowds would stand without even a strap to hang from. Nowadays it is a pleasure to take the voyage. On fine days the broad, long deck is as attractive a promenade as Atlantic voyagers get on the crack liners; on stormy days their warm and brilliantly lighted cabins make reading pleasant. It is a detail, but significant, that the electric lamps are renewed as soon as they are burnt out, the

floors are kept clean and the brasses bright. No private corporation would care so well for the passengers' comfort.

Punctuality and frequency are the main items by which to test the efficiency of a transportation service. On both counts the municipal operation is more than justified. Under the corporation I always allowed forty minutes for making connections at the end of a trip, because, tho the largest boats might land in slightly less time, they could not be counted upon either to be on service any particular trip or to do their best that time. Now I allow uniformly twenty-five minutes and have never been disappointed. The old boats gave a half hour service during most of the day, a twenty-minute service during rush hours, and a forty-minute interval between boats at slack times. The municipal boats give a twenty-minute service in the main, a quarter hour service in rush hours, and at no part of the day are they more than half an hour apart. As to regularity, the praise cannot be too high. Tho during the whole year the operation has been hampered by the construction of the new terminals, the boats have run to the minute; with a regularity, in fact, that is often irritating, for the privately owned street cars and steam railroad on the island are not so conscientious, and when they arrive a few minutes late the hapless passengers don't always admire the municipal virtue.

So far as the experiment goes it demonstrates, therefore, that a municipality, even handicapped by a political machine notoriously corrupt and by the exigencies of a new form of municipal service undertaken before the equipment was complete, can actually run the business to the satisfaction of the people.

What are the financial results? A loss on the year of $250,000, due chiefly to the eight-hour day and higher wages granted by the city to the employees. At first sight that fact is a paralysing blow to the advocates of extended municipal activity. But closer consideration softens the effect. First, it was known and deliberately planned beforehand that the service would not pay until the population of Staten Island largely increased. Manhattan, the core of New York, is terribly congested; below Fourteenth street, in a district which was already crowded, the population has increased by eighty thousand from 1900 to 1905, an increase greater than occurred in any previous quinquennial period. Staten Island contains mile upon mile of beautiful building sites over which the panting thousands of Manhattan should be spread. But the wretched ferry service given by a corporation prevented the migration; it was so infrequent, so slow and so unreliable that people who must reach their work on time or lose their jobs dared not risk depending on it. So Mayor Low, taking a statesmanlike view of the situation, decided that the city must face the first financial loss of a modernized service and trust to increased property assessments and improved health for the greater city for reimbursement. Ultimately, it is expected, the increase of population and greater use of the ferry, following on the improved service, will make the annual income balance the expenditure. As the corporation was losing money even on its antiquated service, it had refused to satisfy the popular demand for improvement.

Are these hopes in process of fulfilment? Every month the number of passengers increases; each month shows an increase over the corresponding month of the preceding year. Clearly the expected migration is beginning. Land values on the island are soaring with disquieting speed. If the assessors do their duty the city's treasury will be reimbursed immediately for the quarter million deficit on the ferry. Last year the total assessed value of the property in the county was $50,578,280, the total amount raised in taxes was $784,756 (being $786,096, less $1,340 allowed for insolvencies, erroneous assessments, etc.); therefore, to secure the return of the whole $250,000 the assessed valuations would need to be raised 30 per cent. This is a big increase, but values have risen fully that amount. It is not possible to say exactly by what percentage all property has increased, but a number of typical instances can be given.

Referring to a farm that is being held for building sites, the owner told a real estate agent recently: "If you had come to me exactly a year ago and had offered me $25,000 for that farm I should have accepted the offer eagerly. In May I was offered $63,000 and indignantly declined

it; later I refused $75,000. I now give you authority to sell it for $126,000 any time before next March."

I know a property which at this moment the owner holds at $36,000. It is assessed at $15,000, the rule in Greater New York being that property shall be actually assessed at full value. In Manhattan and Brooklyn that rule is usually enforced and every part of the city is supposed to apply it. In the winter of 1906, before the reputation of the municipal ferry was established, a farm near Oakwood was sold for $5,800, in the spring it was resold for $17,500 and a short time ago $25,000 was offered and refused, the owner demanding $30,000. Another farm near New Dorp was sold a year ago for $11,000, resold for $13,500, in two months after again resold for $17,000 and again later in succession for $25,000, $37,000 and finally $50,000, an increase of 450 per cent., the only factor accounting for the increase being the municipal ferry. In May last a tract of twenty acres was sold for $5,000. After a second transfer at $10,000 it has found a new owner at $20,000, a four-fold increment within six months. Scores of similar cases might be cited, but, lest I excite the cupidity of the reader, I refrain. Allowing that some of these values are speculative and will sink before they reach a solid basis, they indicate clearly that a general increase of assessments that would produce an additional quarter million in taxes would not be excessive. Landowners who are escaping with these stimulating unearned profits can fairly be made to pay for the feed of the goose that lays the golden eggs.

Had the city been a little more enterprising and long-sighted it might have got back the capital value of the ferry and much besides. Why should it not have followed the German precedent and bought the land on which to settle its workpeople while yet it was cheap, before the municipal service had turned the tide of population this way? What rich plums would then have fallen to its share! In Germany the possession by cities of much land is known to be so necessary for the public good that five years ago the Prussian Government issued directions to the governors of the twelve provinces that they should use all their influence to induce all Prussian towns to buy as much land as they could obtain and to retain possession of all that they then held and should afterward acquire.

Several cities had already adopted this policy and had steadily purchased land as opportunities occurred. Frankfort, Mannheim, Breslau, Magdeburg, Dortmund, Aachen, Dantzig, Stettin and Strasburg have large estates, Strasburg owning 364.78 square yards per head of the population, an area equivalent to a municipal estate of over 263.700 square miles for New York's three and a half millions of population! And the German cities are actively increasing their holdings. Since 1890 Cologne has increased its holdings thirteen times, Chemnitz six times, Munich three and a third times, and Dresden three times. Berlin, despite its very rapid increase of population, added in ten years to its communal holding an acreage equivalent to 21.5 square yards for every inhabitant.

Similar enterprise, accompanied by municipal improvements of transportation, would soon make New York so fabulously rich that the transportation might be made as free as the use of the streets.

Respectability's Complaint

BY BOLTON HALL

AUTHOR OF "THINGS AS THEY ARE," ETC.

"DID you ever think," said the Lake to the Stream, "how much trouble you make? More than two hundred bridges had to be built over you; you have caused freshets and washed away banks; you are an anarchist, you make a noise and ——"

"Did you ever think, said the Stream to the Lake, "that I flow out of you?"

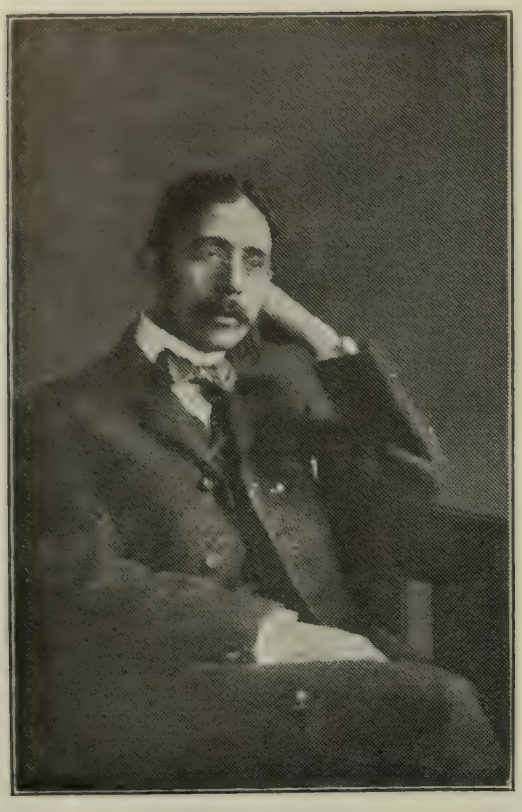
NEW YORK CITY.

Literature

The Pragmatic Philosophy

THE original British "Who's Who" differs from its American namesake in giving a man's recreations as well as his vocation. Turning to the biographical paragraph of F. C. S. Schiller, M. A., D. Sc., Fellow and Senior Tutor of Corpus Christi College, Oxford, we find that his recreations are "mountaineering and editing *Mind*." This official information was really not needed to assure us that Mr. Schiller enjoyed his part in the debates which enliven his magazine of metaphysics. He has as much fun with an absolutist argument as a dog has worrying an old coat when he takes it between his teeth and shakes it and gnaws it, growling most delightfully all the time; then turning it inside out to show that the holes that he has made on one side also appears when it is looked at from the other side.

A new philosophy, like a new boy at school, demonstrates its individuality by its pugnacity. It has to fight for recognition. Properly regarded pragmatism is a metaphysical peacemaker. Its purpose is to settle feuds that have lasted three thousand years, but, as usually happens, the combatants both direct their guns against the mediator. If, then, we remember that Dr. Schiller as a pragmatic philosopher is placed between the firing lines, and that all men enjoy the exercise of those peculiar gifts with which Providence, for its own inscrutable purposes, has endowed them we shall not be surprised that Dr. Schiller's latest contribution to pragmatism, entitled *Studies in Humanism*,* is so largely controversial. Unfortunately, only one side is given, so the effect is like listening to a man talking into a telephone. Our enjoyment of the author's wit is often restrained by the question whether it is properly deserved. In fact, we laughed so heartily over the chapter headed "Truth and Mr. Bradley" that our conscience impelled us to look up and reread Mr. Bradley's paper in *Mind* to see if he did really cut such a ridiculous figure as Dr. Schiller makes out. It is a curious coincidence or something more that the two most prominent leaders in pragmatic thought, Professor James in this country, and Dr. Schiller in England, should have the same characteristic of style. Both have an unhackneyed phraseology, a ready wit, and a brilliant use of illustration; qualities not common in philosophic discussion hitherto. Whether their style is the result of their pragmatic principles or whether they took to this philosophy because of their temperament, is a question that only a pragmatist could decide.



Some of our readers have intimated to us that the article we published on February 21st did not explain clearly enough just what pragmatism really means. We are happy, therefore, in being able to remedy this defect by quoting verbatim Dr. Schiller's definition:

"Pragmatism is the doctrine (1) that truths are logical values; (2) that the 'truth' of an assertion depends on its application; (3) that the meaning of a rule lies in its application; (4) that ultimately all meaning depends on purpose; (5) that all mental life is purposive. Pragmatism is (6) a systematic protest against all ignoring of the purposiveness of actual knowing, and it is (7) a conscious application to epistemology (or logic) of a teleological psychology, which implies, ultimately, a voluntaristic metaphysic."

Dr. Schiller, however, does not bluntly project this definition at the reader as we have here done, but develops it gradually thru a series of sections as Herbert Spencer does his definition of evolution.

This volume is the most comprehensive and far-reaching exposition of the new humanism that has appeared, yet the possibilities it suggests are more fascinating than in the theories it definitely develops. Among many other things it seems that pragmatism may provide a means by which the three modes of thought, metaphysics, natural science and common sense, which have always been at variance and mutually distrustful, may all pull together for the advancement of the human race. Let us take as a single example its treatment of

*STUDIES IN HUMANISM. *By F. C. S. Schiller.* New York: The Macmillan Co. $3.25.

EDWIN LEFEVRE.

faith. Religion has always insisted theoretically that faith is of the highest importance, yet practically it has not made enough use of it. Science, on the contrary, has ostensibly condemned faith, and yet by means of it has gained its greatest triumphs in the advancement of knowledge. The following paragraph will indicate to some readers what is the pragmatic way of regarding it:

"It is useless to close our eyes to the fact that faith is essentially a personal affair, an adventure, if you please, which originates in individual options, in choices on which men set their hearts and stake their lives. If these assumptions prosper, and if so by faith we live, then it may come about that by faith we may also know. For it is the cognitive procedure in science no less than in religion that we must start from assumptions which we have not proved, which we cannot prove, and which can only be 'verified' after we have trusted them and pledged ourselves to look upon the facts with eyes which our beliefs have fortunately biased. Of this procedure the belief in the causal connection of events, the belief that all natural science presupposes and works on, is perhaps the simplest example. For no evidence will go to prove it in the least degree until the belief has boldly been assumed. . . . We start, then, always from the postulates of faith, and transmute them, slowly, into the axioms of reason. The presuppositions of scientific knowledge and religious faith are the same. So, too, is the mode of verification by experience. The assumptions that work, *i. e.*, which approve themselves by ministering to human interests, purposes, and objects of desire, are "verified" and accepted as true."

The Prize and the Cost

MR. THOMAS W. LAWSON has offered, in the daily prints, what he himself would probably describe as "all kinds of money" to the person who will prove that the recipe for "beating" the stock market given by him in *Friday the Thirteenth*[1] is fallacious. "What happened?"—to use the picturesque phrase that Mr. Lawson has raised to the dignity of a familiar quotation clamoring for admission to a new edition of "Bartlett's." Well, nothing has happened as yet, for, whereas nobody has thus far publicly claimed the reward on the one hand, nobody has yet attempted to put Mr. Lawson's system into practice, on the other. It is a very simple system. "Sell short," says the expert of Boston in substance, "from nine in the morning till three in the afternoon; offer to sell more stock than the 'system' can buy; thus you create a panic, and victory is yours. Your credit is unassailable from the opening to the closing of the day on Exchange; smash prices, and you will be able to buy back at an enormous profit what you have sold." It is an ingenious development to its ultimate seemingly logical conclusion of the principle on which all dealing in stocks is based. Only, to try it, dear reader, you must own a seat on the Stock Exchange. That is *conditio sine qua non*, for your broker will not sell short for you unless you "put up" a margin so great that the Lawson system becomes impracticable. The hero of *Friday the Thirteenth* is a noble fellow. He does not take money from the "peepul," not he; he lets the millionaires do that, and then takes it from them. And Morgan, Rockefeller, Frick, Schwab, Havemeyer, Harriman, Keene, Rogers, Schiff, those simple lambs in Wall Street, never discover the trick, and cannot stop it.

Yes, two things have happened after all. The "peepul" have bought coppers very freely, and Mr. Lawson has made a violent assault, with much battery, upon the English language. The language is still in the ring, but then, so is Mr. Law-

[1] FRIDAY THE THIRTEENTH. *By Thomas W. Lawson.* New York: Doubleday, Page & Co. $1.50.

son; and it is the language that is "groggy," especially in its adjectival superlatives. A crude, shrieking dime novel is this story, and therefore not likely to be without its hosts of readers. It is an incendiary book as well.

Where Mr. Lawson tells us how easy it is to make millions in Wall Street, Mr. Edwin Lefevre[2] sets out to prove that it is extremely difficult, and he is the more convincing of the two. His account of the tricks and shifts and intricacies and dangers, the plots and counter-plots of stock manipulation on a gigantic scale, is remarkably clear and interesting. While the endless wheels within wheels, the constant clash of interests, purposes and brains, threaten time and again to confuse his hard-headed, nimble-witted master of finance (a well-drawn representative type), they never bewilder the reader. One need not have more than the modicum of general knowledge of "the Street" possessed nowadays by all of us, to recognize and admire the realism of this story, and the ease with which the author keeps its divergent interests in hand. For good measure he gives us an attractive love story. Mr. Lefevre's growth in his art is constant.

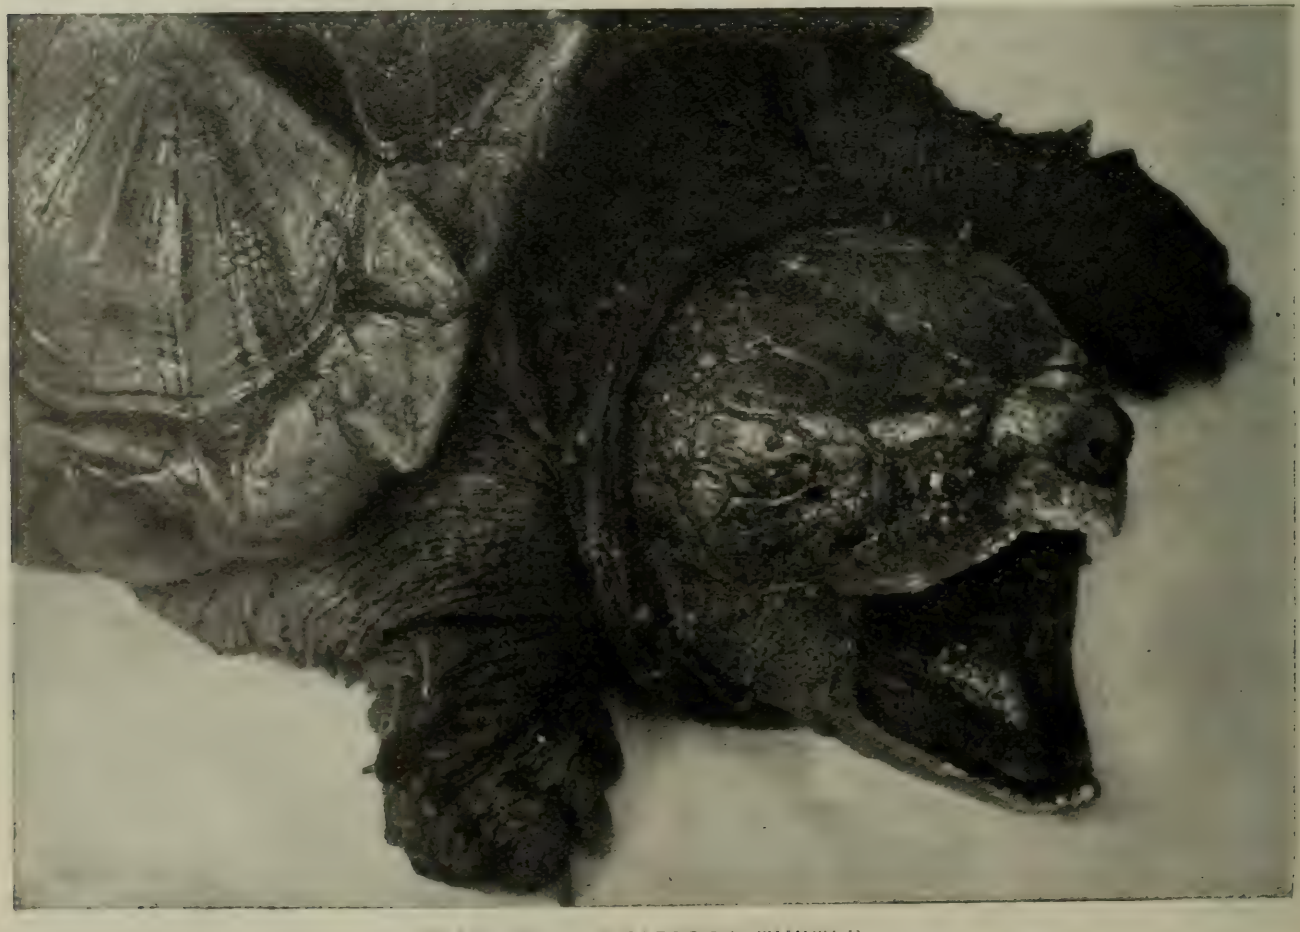
The Reptile Book

For the amateur naturalist there has long been an abundance of books on birds and beasts and insects, but *The Reptile Book** is the first comprehensive popular work on the turtles, crocodilians, snakes and lizards of the United States. But it is more than a popular book, for it is a gold mine of information for the zoölogist.

The first part of the book treats of turtles, terrapins and tortoises. With regard to these popular names, tortoises are strictly terrestrial, while the aquatic forms are in some localities called turtles, in others terrapins. Most interesting of these are the giants of the sea, best known of which are the leather-backs, loggerheads, green turtles and hawk's bills. The first named are the largest of living turtles, some specimens being over six feet long and weighing more than 1,000 pounds. Most valuable are the hawk's-bills, from whose plated backs comes all the "tortoise shell" of commerce. Smaller than the sea turtles, but not without abundant interest, are the aggressive snapping turtles, the common mud-turtles, the pond-turtles, the terrestrial box-turtles, the soft-shelled turtles and the great land-tortoises.

Part II is devoted to our American crocodilians, the alligator and the rare crocodile from Southern Florida. Concerning the latter's habits it is not a "man-eater" in the wild state, but becomes fierce and dangerous in captivity. This is surprising, for alligators learn to follow keepers like dogs.

Part III, with 110 pages, deals with the lizard, of which there are in North America ninety-seven species. Our well known chameleon is the United States representative of more than a hundred species in tropical America. It resembles the true chameleons of the Old World in its habits of changing colors—an involuntary process influenced by light and temperature—but is not closely related. Another type, the ever-interesting horned lizards, commonly called horned "toads," of the sandy regions of the Western States, are remarkable for their viviparous habit, producing from six to ten living young fully able from birth to care for themselves. It is a popular belief that certain species of these are able to spurt blood from the eyes when disturbed, and Mr. Ditmars vouches for this. Still another group of curious lizards are the degenerate glass-snakes, which have lost their legs; but, contrary to popular belief, they can not collect their parts after having been broken into fragments. And last but far from least among our lizards is the Gila monster or heloderma of Arizona. The poisonous nature of its bite has long been questioned, but the evidence is strongly in favor of the belief that it is very dangerous to man. Fortunately, no other poisonous lizard lives in the United States. A strange fact is that the large tail of the heloderma is a storehouse of fat which supplies energy in a day of need when food is scarce.



For the climax of this book the author has reserved the snakes, and to them more than half the pages are given.

[2] Sampson Rock of Wall Street. *By Edwin Lefevre.* New York: Harper & Bros. $1.50.

*The Reptile Book. *By Raymond L. Ditmars.* New York: Doubleday, Page & Co. $4.00.

North America is very rich in serpent life and to do justice to the great group the author has written a brilliant account which will make any reader not a true naturalist "dream snakes." Here interesting facts are recorded on every page. There are small species of boas in California and Arizona, and they show rudimentary hind limbs which are of great interest to students of evolution. The burrowing blind snakes of the Southwest have very degenerate eyes. The striped garter snakes are most abundant in species and individuals, but they are harmless. The common water-snakes, living along the banks of our streams, are not poisonous. The blacksnake has no charming or hypnotic power; it is not a constrictor squeezing its prey to death; and it is not a king of snakes. The milk-snake does not suck milk from cows, but has gained the reputation by prowling about farm buildings in search of rats and mice. These are samples of notes on habits of snakes, and as one reads he is surprised many times to find that so many of our popular notions concerning certain snakes are unfounded. As a fitting close, the last pages are given to an exceedingly readable and thrilling account of the deadly viperine snakes—rattlesnakes, copperheads, moccasins, to whose bad habits are to be traced much of our natural fear of snakes in general. Few readers of the author's accounts of his experiences with these viperines will be inclined to apply for his position as Curator of Reptiles in the great New York Zoological Park.

Space will not allow adequate selection from the thousands of interesting facts packed into this book. Take it all in all, it is a great book, well planned, clearly written, popular and yet scientific, and magnificently illustrated with eight plates in colors and more than four hundred photographs from life. Those who are interested in natural history of animals will be pleased with this book, which will certainly work strongly for interest in the great group of the reptiles which has long been neglected, probably ever since a representative of the group became involved in a famous incident in a certain traditional garden, and so prejudiced the human race against them.

HEAD OF A SNAPPING TURTLE.
From "The Reptile Book." Doubleday, Page & Co.

Islam in Practice

An eminent Moslem divine, stated preacher at one of the great mosques of Constantinople, once described, in a pleasant chat with the present writer, the essentials of the Mohammedan religion. He said:

"The most important thing is our profession of faith in one God and in his prophet (on whom be peace). Three things are rather hard: the pilgrimage to Mecca, where, however, intention is rated as performance, if one's allotted days of life expire before the intention is fulfilled; the poor rates, which one does not have to pay, if always without ready money, as I am; and the fast of the month of Ramazan, which one can manage to get thru when it does not fall among the long days of summer. The fourth essential is daily worship, which, after all, is easy, since it is the recitation of a lot of words. In these four you have the elements of the most sensible religion the world ever saw."

These essentials were rather flippantly recited in the unconventional tones of intimacy. The white-turbaned, gray-bearded preacher clearly did not find in his religion any severe control of the springs of action. His content with outward forms in religion was not peculiar. Acquaintance with Mohammedans shows that what a Christian would choose from the Koran as essentials of its scheme of piety widely differs from what a Mohammedan selects under the influence of his prophet's comments on his own book. This difference of point of view ensures surprises for all who encounter the fruits of Islam in practical life after they have perused the writings of arm-chair eulogists of its doctrines.

*The Mohammedan World of Today** comes near to providing us all with such an encounter. The book is the result of an effort by the Cairo Missionary Conference to learn, for its own information, the truth about the practical effect of Mohammedanism upon the lives of its followers thruout its domains. To this end it secured reports, each written by a specialist residing in the land described and prepared for his task by years of intimate acquaintance with the people and of patient study of their aims, hopes and ideals. The writers represent eight denominations, while in nationality they owe allegiance to the United States, Great Britain, Germany, Holland and Sweden.

On reading these various reports one is impressed with the extraordinary similarity between them. They offer from all points reiteration of the feebleness of intellectual life characterizing Mohammedans, of the content of educated Moslems to leave the masses of the people in ignorance of letters and therefore of the elements of their religion, of the prevalence of sensuality as a malignant cancer which no X-rays can heal, of the wilful degradation of womankind, of hate toward all men outside of Islam, of disregard of justice and of law, and of violence and internecine war that have placed millions of Moslems under obligation to European governments for stopping bloodshed and giving the people their first acquaintance with lasting peace. All of these characteristics are traceable to the doctrine that formal worship is a full definition of the meaning of the service of God, control of the passions and appetites being a mere question of expediency, man having reached his best when he has learned to copy the forms of worship used by Mohammed. In short, the book—unintentionally, since the writers are neither bigots nor near enough together to act in collusion—is a tremendous indictment of the Mohammedan religious system on the practical side.

These papers have a cumulative effect They justify an application extending far beyond its intention of the remark of one of the writers, who points out (pp. 109, 110) that one could find no better polemic against Islam than presentation of the social, moral and intellectual condition of Arabia. Islam has had undisputed possession of the peninsula almost since its birth. In its native soil the tree planted by Mohammed has grown with freedom and has brought forth fruit after its kind. Its kind is this: Morality is on the lowest plane; conscience is petrified; cruelty is common; lying is a fine art and robbery a science. Islam as

* The Mohammedan World of Today. Being papers read at the first Missionary Conference on behalf of the Mohammedan world, held at Cairo April 4th-9th, 1906. Edited by S. M. Zwemer, F.R.G.S.; E. M. Wherry, D.D., James L. Barton, D.D. Illustrated. Pp. 402. New York: Fleming H. Revell Co. $1.50.

a force to uplift men has been tested there during thirteen hundred years, and it has piteously failed.

The papers are of very unequal merit. The one concerning Sumatra is vividly interesting, and those relating to India are perhaps the most carefully elaborated. The book has many serious blemishes; it omits North Africa from the field of view; its index is of little use; and its illustrations, good enough in their way, are hastily collected from the stock in general circulation. But its defects do not destroy its interest nor its profound importance as a careful exhibit of the practical results of Islam upon the races that have committed themselves to its guidance.

SKI-JUMPING.
From Rook and Jardine's "Switzerland."

Switzerland: The Country and Its People. Written by Clarence Rook. Painted by Effie Jardine. New York: G. P. Putnam's sons. $6.00.

Ordinarily in these big geographical picture books that are so popular now the printed matter is negligible. It is only put in because it is customary to have some type "to go with" the illustrations. We were, therefore, very much surprised to find Mr. Rook's part of this book not only readable, but interesting, even informing, tho not burdened with statistics. It is written for those who want to know more about the real Switzerland than the usual tourist's glance. He takes us at once behind the scenes, or perhaps we should say the scenery, and shows what sort of a government it is which works so smoothly that the stranger does not know it is there. He begins with a startling introduction, a dinner in a Swiss restaurant, at which, besides the foreigners, were leading burghers of the canton, active in political affairs, yet none of them could tell the name of the President of the Swiss Republic! It is different in the United States. Switzerland is a democracy pure and simple, without statesmen of dominant personality and without party government. Here are all the elements of discord, diversities of race, language and religion, such as threaten to disrupt other countries, like Austria-Hungary, yet Switzerland is peaceful and harmonious, settling vexed questions by

popular vote thru the initiative and referendum. After sketching the history of the country, the author tells in the same interesting way of the ice sports, skating and ski-ing, of the roads and tunnels, and of the schools and hotels. His "literary associations" of Geneva are almost exclusively concerned with Voltaire and Rousseau; he does not seem to know that we Americans are now making pilgrimages to Geneva as the home of Amiel. But in our absorption with the text we must not omit to mention the sixty full page colored plates and twenty-five half tones.

The King of Court Poets. A Study of the Work, Life and Times of Lodovico Ariosto. By Edmund G. Gardner. E. P. Dutton & Co. $4.00.

The work of Mr. Gardner is not only a biography of Ariosto, and the finest biography of the author of the "Orlando Furioso" that has yet appeared in English, but it contains a complete and luminous picture of the political and literary condition of Ferrara from 1500 to 1530. He has, and we think very judiciously, treated the Italian poems and comedies in the closing chapters, and thus left himself at liberty to deal fully with phases of the poet's character to which comparatively little attention has been paid by other biographers. It is to his poetry that Ariosto owes his glory, and most people think of him simply as the greatest poet of the Renaissance. However, Mr. Gardner shows that he was something else besides. He consecrated a notable part of his life to politics. He filled important missions in which he acquitted himself with the suppleness and ability of a professional diplomat. Those who have read only his great poem, and who have seen in him nothing but a man of prodigious imagination, preoccupied solely with the creation of fictions, at one time bordering on the sublime, at another frankly ludicrous, will be astonished at his aptitude for affairs and his skill in unraveling them, even when most complicated. If Ariosto had not been such a great poet and philosopher, he would undoubtedly have been better known now as an administrator and a statesman. Mr. Gardner devotes a large part of the book to this aspect of his life; and he has done well. Ariosto has been too much translated, criticised and commented upon to render any further minute appreciation of his literary merits indispensable; and a study of him as the diplomat, the friend and confidant of the Dukes of Ferrara, Hercule I and Alfonso I, and of the Cardinal d'Este and Lucrezia Borgia, gives a new and fascinating interest to his career. Mr. Gardner appears to have investigated all the original sources bearing on his subject, and, as a natural consequence, he has shown the unreliability of a good many legends. Thus, one of the commonplaces of literary history is the ill treatment of the poet by his patron, the Cardinal d'Este. Hippolito was such an unscrupulous ruffian that there is no necessity for deepening the black tints in his character. The author shows that he was a most munificent patron of Ariosto, went to the entire expense of bringing out the first edition of "Orlando," and never uttered the words attributed to him on receiving the first copy: "Messer Lodovico, where in the world did you gather all this rubbish?"

Hebrew Life and Thought: Being Interpretative Studies in the Literature of Israel. By Louise Seymour Houghton. Chicago: The University of Chicago Press. $1.50.

Mrs. Houghton has long done useful service in promoting thoro knowledge of the Bible and in according fair and generous appreciation to the writings of devout, scientific biblical students. It is a pleasure, therefore, to bestow commendation upon her own worthy effort to popularize some of the results of Old Testament scholarship. Few friends of the Bible would take offense at her essay on "The Day-Book of the Most High," and many would win from it a juster estimate of the character of the Old Testament writings. The chapter on "Folklore in the Old Testament" presents established facts in a manner to compel consent and dispel alarm. Other subjects treated with discriminating judgment are the Poems of the Hebrews, their Heroes, the Story of Elisha, Hosea, Proverbs, Job, and the Law and Modern Society. Mrs. Houghton writes

THE EXILE'S LIGHT.
From "The New Art of an Ancient People."

with enthusiasm and *con amore*, and if we were able to name a defect it would be a certain light passing over the limitations and defects of Old Testament morals and belief.

The New Art of an Ancient People. M. S. Levussove. New York: B. W. Hubsch. 75 cents.

Under the above title Mr. Levussove has written an appreciation of the work of Ephraim Mose Lilien, a young Hebrew illustrator of Munich. Lilien's work belongs to the allegorical and decorative order, in which the underlying idea is carried out with small regard to conventional notions either of prettiness or realism. It is at times difficult for the layman to see why the exaggeration of perspective and the indication of background only by the slightest symbols of landscape should be improvements upon a method that really suggests to the imagination a scene of natural beauty, yet it is true that the figures dominate Lilien's designs, and tell their stories impressively. The bookplate of Maxim Gorky, ugly, strong, full of meaning, is particularly interesting, and the Isaiah and the Passover, among others, have a satisfying dignity of conception. Mr. Levussove leaves the reader not only with an understanding of the highly poetic value of the artist's work, but with a vivid sympathy for the racial quality of serious aspiration, which he exemplifies.

Expositions of Holy Scripture. By Alexander MacLaren. A commentary on the entire Bible, in 30 volumes. Sold in series of 6 volumes. First series: Genesis, Isaiah, Jeremiah, Matthew. Second series: Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Ruth, Samuel, Mark. New York: A. C. Armstrong & Son. Each series, $7.50.

Dr. Maclaren has long been known as an expository preacher of exceptional ability. His style has scarcely changed thruout his long life. Year after year he has produced manly, common-sense interpretations of the Bible as it reads in plain English, with vigorous applications to current sins and hearty encouragement of good morals and sound faith. He has taken no pains to learn of historical criticism, and these books are not to be recommended as a commentary but as a series of practical sermons on consecutive Scripture texts. The work is rather voluminous and diffusive, making it cumbersome and expensive for practical use.

Editorials

Secretary Taft's Candidacy

SECRETARY TAFT is a candidate for the Presidential nomination, and he desires the support of his own State in the nominating convention. It is quite well known that to Mr. Roosevelt he is more acceptable than any other aspirant who has been named. Senator Foraker has opposed Mr. Roosevelt's policy on certain prominent questions. He was the only Republican in the Senate who voted against the Railroad Rate bill. With the assistance of Senator Dick he controls, it is said, the machinery of his party in Ohio. His Senatorial term will end in 1909. Congressman Burton — who has fought against him and Senator Dick, and who is a supporter of Secretary Taft—would like to take his place in the Senate. The President has recently ignored the recommendations of both the Senators in the appointment of a Federal judge. Senator Foraker now says in a public statement that he will ask the Republicans of Ohio to choose between Mr. Taft and himself. They are to be directed by the State Committee to show, by the election, several months hence, of delegates to the State Convention, their "preference as to candidates for United States Senator and for President."

This step was taken while the Secretary was at sea, on a voyage to the Canal Zone. His brother responds for him, accepting the plan, but restricting the application of it. Mr. Burton is eliminated. It is to be Taft against Foraker, "for the Presidency or Senatorship." And the Secretary's brother remarks that it will be "a direct contest between the friends of the Administration of President Roosevelt and his opponents."

Secretary Taft cannot expect to win the nomination without the support of his own State in the National Convention. It now appears that to obtain that support he must overcome the opposition of the two Senators and the influence which they are able to exert by means of the "organization." Senator Foraker is a man of courage, a hard fighter, and an effective public speaker. But his personal influence in the rank and file of his party is not so great as it was some years ago. Service in the interest of corporations at the State capital, followed by his opposition to the President's railway legislation at Washington, has deprived him of a considerable share of that public confidence which he once enjoyed. During the months preceding the election of delegates he will be free to address the people. The Secretary will be busy with his official duties; in August he will sail for the Philippines.

Much bitterness may be shown in this contest, which will excite interest thruout the country because it will be regarded by many as a battle in the Republican party between the reactionaries and the supporters of Mr. Roosevelt. And there will be much speculation as to the Senator's real purpose. Does he think it is possible for him to win the nomination, even with the support of his State? Does he believe that if nominated he could be elected? Is it his aim only to secure reelection to the Senate? Is he not striving merely to serve the interests of the corporations by preventing the nomination of one who represents the purposes and policies of Mr. Roosevelt? These are some of the questions that will be asked.

In the canvass which is to precede the election of delegates, are the President and his policies to be attacked by one faction, and the Senator's services in behalf of corporations to be criticised sharply by the other? A contest of this kind might become so bitter that no candidate from Ohio could hope to be honored in the National Convention. We do not think the Republicans of Ohio will permit such an exhibition in their State. Perhaps after a time we shall see harmony restored and the Senator, at the head of the Ohio delegation, nominating Secretary Taft in the National Convention. Stranger things have happened.

Mr. Foraker has come to be regarded by many, rightly or wrongly, as a leader or representative of the reactionaries in his party. To our mind, the evidence in support of this idea is by no means conclusive. But no one who by his acts and utterances has furnished warrant for

such a conception of his attitude and purpose by the public is an available candidate for the Presidential nomination in the Republican party. The nominee of that party in 1908 should be a man committed to the support of the leading features of Mr. Roosevelt's domestic policy —especially those features which relate to the supervision and regulation of the railways and the subjection of all great corporations doing an interstate business to Federal control. Altho Secretary Taft's public utterances concerning these questions have not fixed themselves in the public mind, the chief source of his strength as a candidate is the prevailing conviction that he is in accord with the President with respect to them.

Mr. Fairbanks has made many public addresses since he became Vice-President, and has had as many opportunities to express forcibly his opinions as to the subjects and policies which we have in mind. The American people are not aware, however, that he has said anything about these questions. If he had vigorously supported the policy of the Administration, his candidacy would have much greater popular strength than it now possesses. No colorless man, nor any candidate who does not positively support the main ideas of President Roosevelt's policy, will get a majority next year either in the Republican Convention or at the polls.

The Way to Decent City Government

THE gratitude and the thanks of the public are due to Mr. George Kibbe Turner for writing, and to *McClure's Magazine* for publishing, two articles which may unhesitatingly be described as the most illuminating studies of municipal corruption and the one possible way to achieve decent municipal government, which have as yet been made. If the American people would read and mentally digest Mr. Turner's articles, the probability of substantial improvement would be greatly increased.

In his article on Galveston, published in October, Mr. Turner described the way out which Galveston has experimentally demonstrated to be practicable. In his April article on the City of Chicago Mr. Turner shows convincingly what are the real sources of municipal corruption. To understand these is to understand why the Galveston plan of reform succeeds, and why it is the only one that can succeed.

Corrupt municipal conditions are protean, and they impair human life at every point. Filthy streets, inadequate sewers, impure water, unsafe construction, unsanitary tenement house districts, dens of vice, bands of thugs who waylay and murder—these are human ills which in the aggregate are an appalling mass of misery, and which are preventable. Not only are they not prevented, but they are deliberately increased by official and political malefactors, and for the entirely simple, transparent reason that by increasing them the malefactors make money.

What is the process? It is Mr. Turner's answer to this one question that is clarifying. There are four possible sources from which governmental officials and professional politicians can derive illegitimate revenue for themselves. One is the public income, which can be stolen as it comes in or as it is paid out. This crude method is dangerous, and has not been generally followed since Tweed's day. A second is the so-called "honest graft" of Senator Plunkett's philosophy. A typical form of it is the profit on real estate improved by municipal action, of which politicians have the first knowledge. A third method is thru corrupt transactions in the sale of valuable franchises. The fourth is the grafter's rake-off on the business of dissipation.

The business of dissipation, as Mr. Turner shows, is not only the oldest, it is also much the largest and most profitable source of illegitimate gain to the professional politicians, and, in proportion to effort and risk, the most profitable. The figures are convincing. For example: The gross receipts of the street railways of Chicago are $16,000,000, and of the elevated roads $23,000,000 a year. From this $39,000,000 a considerable sum might be devoted to political corruption, but it would be a small item in comparison with the amount obtainable from dissipation in a city which

spends $100,000,000 a year for alcoholic liquors, $20,000,000 a year for prostitution, and $15,000,000 a year for gambling.

Dissipation shades down from legalized expenditure thru prohibited but not rigorously punished vice to depths of criminality that are dangerous. Much of it flourishes only under police protection, and most of that which is legalized is, for economic reasons, in alliance with the illegal. The whole business, therefore, has a definite, substantial interest in maintaining political protection and in securing political privilege. To this end it creates and sustains a most efficient political organization, the central figure of which is the ward or district boss, who is a professional political middleman, buying votes and selling protection.

The Galveston plan succeeds because it strikes directly at the political middleman and sweeps away the whole organization of ward politics. It is simply an adaptation to city conditions of the New England town plan of government by town meeting and elected selectmen. The Galveston Municipal Commission is an elected board of heads of departments, directly nominated and directly elected by the people, and, therefore, directly responsible to the people. There is no unnecessary machinery.

Here, in simple, straightforward, direct popular action, a consistently democratic plan is one possible salvation of American municipal life. Not ingenious machinery, but a free opportunity for the people to express their will and to govern themselves—uncomplicated democracy—therein lies our hope.

Studying Labels

THERE is a popular impression that the consumer does not need to pay attention to the labels on the packages of his food now because the last Congress passed a law that insures its purity. On the contrary, the effect of the new law is quite the opposite. The Government has not assumed the burden of responsibility for the quality of food, but has thrown it directly upon the shoulders of the people by requiring labels to tell the truth. Once man lived by faith alone. Now he can be guided by knowledge. Formerly it was not worth while to study labels. One might as well spend the time reading novels as a more interesting form of fiction. Of course, something could be learned from them. We understood in a general way that "Pure Spice" meant from 5 to 10 per cent. of ground cocoanut shells; that the word "Selected" on canned fruit indicated unsaleable refuse; that "Mixed Mocha and Java" stood for special grades of Brazilian coffee. Still, even these prognostications could not always be relied upon.

People who prided themselves on being particular bought the highest priced goods in the market in the belief that the best was always the dearest, but their confidence was often misplaced, for, strange to say, there were manufacturers astute enough and mean enough to understand and take advantage of this method of selection. As tho to disprove the complaint that trusts stifle competition, manufacturers that had a practical monopoly were accustomed to put out products of the same quality under different trade names at different prices, with the result that the higher price sold the better. Most of us had been trained in childhood to eat what was set before us, asking no questions, and we followed that practice in after life. To pure ignorance all things are pure. We put blind trust in some particular dealer whose goods we had heard favorably spoken of—in the advertisements—and that was the best we could do. If we got dyspepsia we cursed corporations and accused the food commissioner of not doing his duty.

Now the burden of proof, the proof of the pudding, is laid upon us. All the mavericks are to be rounded up and branded. The law does not prohibit any particular mixture or adulteration, except a few of known harmfulness, but requires that the label state the ingredients correctly. It does not dictate what a man shall eat, but gives him a chance to know what he is eating. When doctors disagree the patient is left to decide the question. The patient in this case, often too literally, is the public. The question of the harmfulness or innocuousness of the chemical preservatives and colors commonly used in food is one on which doctors have never been able to agree. Experiments are conflicting and deduc

tions are dubious. Now, the question is referred for settlement to the stomachs of the people. Let every man read the labels on his foods and then take counsel within himself. We need no longer watch with anxiety the pallid or florid cheeks of the borated and salicylated clerks of Washington departments. Each man can experiment for himself in his own private laboratory. If he finds that French peas greened with copper, cherries tinct with anilin, and butter golden with annatto agree with him, as he probably will, he will prefer them to mud-colored peas, anemic cherries and lardy-looking butter.

The improvement in preparing, preserving and packing foods of all kinds has made as great a transformation in the business of the grocer as has occurred in that of the druggist on the other corner. When the grocer dug our sugar, crackers, dried apples and coffee out of a barrel we were personally interested in his moral character. Now that all he does is to hand down cans and cardboard boxes to us, we are no longer concerned with his soul; all we demand is a pleasant smile and a prompt boy. The manufacturer appeals directly to the consumer over the head of the middleman by means of magazines and street car placards. Future progress will be in this direction, and to get the benefit of it the consumer should do his part by studying labels. He, or she, should read them thru, especially the part in fine print. It is a good plan to keep a label book or box, or rather two of them, putting into one the wrapper or carton of those preparations that prove good and into the other those that are to be avoided in the future. There is no law against a kitchen blacklist. By applying to the Food Commissioner or Agricultural Experiment Station of the State one will get chemical analyses of all the prepared foods sold in the local market, and can learn which are superior and why. This information should be filed away in the label boxes. A little more attention to trademarks and names would do more to improve the quality of prepared foods than threats of imprisonment or magazine *exposés*. There are many manufacturers who have been as good as they could be and not lose money, but when you think that nobody cares when you are good, or knows when you are bad, it is not encouraging to a life of high ideals. The consumer now has it in his power to put into the old proverb, "Honesty is the best policy," a truth it long has lacked. Collecting labels is more profitable than collecting trading stamps, and one can have also the satisfaction of knowing that his fad is helping along a great moral and dietary reform.

The Greatest Man in America

It was a somewhat bold thing for Professor Munsterberg to decide who is on the whole the greatest man in America. The fields of greatness are many, as Professor Munsterberg recognizes, and he selects ten men, in as many different fields of activity, as most prominent. They are Simon Newcomb, Edison, William James, Howells, Sargent, Root, Pierpont Morgan, Carnegie, Eliot and Roosevelt; and, on the whole, he puts President Eliot first.

It is noticeable that three of these men belong to the Harvard faculty, of which Professor Munsterberg is a fourth member, while President Roosevelt is a famous graduate of the same university and has often been nominated by the newspapers as President Eliot's successor. If Harvard can claim so many of the primates she leads our universities and colleges, and as in the "America's" British race, "There is no second."

That to President Eliot is rightfully given the first rank in education we readily allow, for he has been the foremost leader in the specializing system in our colleges, the wisdom of which, however, is not yet settled, and no one has done so much to unify and harmonize the secondary and the higher education. He has also taken a broad view of political and social and moral questions, showing our duty to treat the Chinese with human decency, and he has favored the expenditure of the nation's wealth rather for education than for war. Indeed, peace has been a favorite topic with him, and in his late address in Canada he showed how the "self-denying ordinance," as he called it, by which, after the War of 1812, the United States and Canada agreed to trust each other and put no war vessels on the Great Lakes

and no forts on the Canadian border, had ensured peace between the two great sections of the Continent.

Yet President Eliot has not in his utterances escaped the frailties common to the human race, any more than has President Roosevelt, for wise men are not always wise. A late instance is his admission that if the number of colored students at Harvard should become very numerous it might be necessary to segregate them. In the matter of our responsibility for the Philippines he was infected by a somewhat too common Boston obsession; and we recall an unhappy address made by him at Salt Lake City some years ago which much pleased the Latter Day Saints. Nevertheless, Professor Munsterberg has not much missed his mark, and it is as difficult to contradict him as it is in any other sort of alignment where the objects aligned cannot be measured by common standards. To compare Roosevelt and Newcomb, Eliot and Edison, is as impossible as to grade the ocean and the sky, or to compare an algebraic demonstration with a sonata.

Old Steamboat Days Again?

THE enthusiastic encouragement given by the cities along the Missouri River to plans for the re-establishment of steamboat lines for freight traffic is a promise of revival of one of the most picturesque features of early Western life. The course of the emigrant was not all on land; thousands made much of the westward journey on the double-decked stern-wheelers that noisily paddled their way up and down the Missouri and other interior rivers. Valuable cargoes of furs and buffalo robes were carried on these boats, and the traffic was a strong rival to early railway lines.

Of late years the steamboats have been abandoned except on the Ohio and Mississippi, where one may yet find a touch of the old-time pleasures and the flavor of eighteenth century romance in the troublous passage of the little fleets. But as a factor on the other streams, so far as freight is concerned, the prestige of the boat lines has vanished. Where over fifty packets ran regularly between St. Louis and Sioux City, not one remains. It seems to have been accepted without argument that the railroads were all sufficient for any traffic that might be needed.

Of late the political economists of the West have been studying the railway rate problem and have noted the vast expenditures in the East for canal construction and river improvement, to the end that there might be secured a rival for the railroads that would compel a lower rate than would be charged if no competition existed.

It has dawned on them that the Western rivers furnish the basis for a remedy, and they have begun in a practical way to bring about the old river traffic, once so important.

A few weeks ago the first steamboat in years made its way from St. Louis to Kansas City. It was received at every landing by crowds, and when it arrived at its destination speeches of welcome and cheers of thousands were its greeting. It was hailed as the beginning of a new era—or the return of an old *régime*. Plans are being pushed to completion that look to the establishment of a fleet of these steamers for the seven-day run between the two cities. Other lines to the farther Northwest, with larger fleets to the Gulf, are in prospect. Ship canals are planned, one in particular to connect the Missisippi and the Great Lakes—all of which means a new method of regulating freight rates for the vast output of the West's granary.

The West is not particularly anxious to see steamer smoke. It promotes steamer lines for the same reason that New York voted for deepening the Erie Canal—to bring about water competition. The saving of a few cents per hundred pounds on the grain and beef sent out of the Middle West means trips to Europe and automobiles for producers. If the steamboat can bring this about it is exactly the thing for which they are searching.

It is a curious fact that, despite the immense sums spent by the Federal Government on the improvement of our rivers, the past two decades have been a period of absolute and relative decline in river shipping. A quarter century ago there were on the Western rivers vessels having an aggregate tonnage of 394,048;

last year the corresponding figures were 174,319, less than half. The decline was steady during the period except for a slight rally in the early nineties. The average tonnage last year was only 70, and but two vessels of over 1,000 were registered as built on the Western rivers. To such decline has come the once important feature of the nation's internal transportation.

It is doubtful if ever again shall we see the old-time passenger trade that was so great a feature of travel in the '60s. The floating palaces with their social delights were pictured in novel and rhyme. The races when negro boys were supposed to be used for weights on the safety valves and when disaster usually closed the contest furnished the motif for many a tale. Charles Dickens found in such a trip many discomforts, to be sure, but others did not.

One may today enjoy a delightful ride up the Mississippi from St. Louis on the freight and passenger steamers, stopping at the busy towns and floating thru the beautiful country between; or he may sail away down thru "the land of cotton" to New Orleans, securing a rest and a varying panorama of beauty that will do his soul good.

But these are not what the new idea in Western transportation means. It is a very utilitarian theory that animates the movement for boat lines. It is presumed to return large financial dividends. As the waterways were evidently meant to be used, it is hoped that the revival of old steamboating days will be satisfactory and profitable. It will add variety and picturesqueness to our internal shipping interests.

Our New Consular Service

For many years each of the principal nations of Europe has had a permanent consular service, and naturally, therefore, has endeavored to make it efficient and creditable by selecting young men of good ability, education and culture to fill vacancies as they occur in the lower grades of office. The mere fact, consequently, of belonging to the service came to be regarded as satisfactory proof that the consular officer merited the honor, intellectually and socially, and that he might be accepted by his colleagues in the other European services as an equal.

Until recently the United States had consuls, but not a consular service, and our consuls were appointed, in the great majority of cases, because of the political activity of either themselves or their friends. The result was that many American consuls were ill-bred and illiterate, and contributed much to the hilarity of the nations, but very little to the knowledge which our commerce and trade were seeking of foreign conditions. The evil of our system was, of course, glaring, but no one felt quite bold enough to correct it until Mr. Root became our Secretary of State. Owing to his enormous acquaintance among the greatest business houses of our country, he was more familiar than was any of his predecessors with the defects of our foreign commercial system, and he plainly saw that all remedies would be unavailing if we continued to be indifferent to the capabilities, character and conduct of our consuls. He approached and even reproached Congress so sensibly and justly that he soon obtained a consular bill that gave to the United States a consular service that will rank with the best in existence.

Already, in conformity with the requirements of the new law, examinations of a strict and searching but perfectly fair nature have been held, and a number of names have been written on the eligible list. The examinations are both oral and written, and the two are deemed of equal value. The oral examination is conducted so as to determine the candidate's business ability and personal fitness for the service, while the written examination tests his knowledge of at least one modern language other than English, of the natural resources of the United States, its political economy, international, commercial and maritime law; American history, political and commercial geography, modern history, since 1850, of Europe, Latin America and the Far East, and, incidentally, the common English branches. All appointments will be made for merit exclusively, and the equally just rule has been established that all promotions shall be based on efficiency.

As we have fifty-seven consulates-

general and two hundred and fifty consulates, and as all of them are salaried offices ranging from $2,000 to $12,000, our new service will doubtless seem, and be, attractive to many young men, just as our military and naval services are, and it should have the same enthusiastic support of our people that the two latter have. We need regulars in our commercial service quite as much as we do in our military and naval services, and more, for we are dedicated to peace rather than to war, and commerce is the great promoter of peace. In modern times we have found that when intelligently managed, commerce does something more than gratify self-interest; it actually develops a strong moral force, having its origin in the consciousness that others have rights we are bound to respect, and are affected by conditions which we must study and understand, and with which we must sympathize. The commercial relations of the nations, therefore, are on a higher plane than formerly they were, and they require trained and intelligent men to develop them. We might possibly get on without good diplomats, provided we could keep a man like Secretary Root in Washington, but even with him there we must have a strong and capable consular corps if we would protect and develop our commercial relations. Since Mr. Root entered public life he has made many noteworthy reforms; but nothing that he has accomplished will be of greater value than his completely successful effort to give to the United States a permanent and competent consular service.

Vacation Pictures and Articles

We hope our readers will not forget the requests we have made in our two last issues for vacation articles and photographs to use in our annual Vacation Number, June 6th. Already we have received a gratifying number of articles, but the pictures are coming in rather slowly. Remember that we offer $25 for the best picture and $2 apiece for all others we use. For every article we print we shall be glad to pay $5. The article can be illustrated or not, as you please, but it should not be over 500 words in length, preferably 300 or 400 words. There is no limitation of character for these articles. Write about anything you choose that is appropriate to a Vacation Number. All pictures and articles must reach us by May 1st.

Our Peace Delegation

It is announced from Washington that the President will appoint one or more additional members to the American delegation to the forthcoming Hague Conference. This is as it should be. Our seven delegates already chosen are men of great eminence, learning and dignity, men who can be depended upon to uphold the American prestige among the nations. But not one of them is an acknowledged authority on Peace, nor, so far as we are aware, has any special intimacy with the historical or philosophical aspects of that world movement which would substitute law for war. We hope that the new members of the delegation will be more distinctly peace authorities, such as are Congressman Richard Bartholdt, President Nicholas Murray Butler or Prof. John B. Moore. If, in addition, they should not be afraid to stand around in ante-rooms and ring doorbells at night, they might be able to do as great a work in the coming congress as Mr. Frederick W. Holls did in the first congress in bringing into being the Hague or Supreme Court of the World.

A British Parallel

The trial of the murderer of the wealthy William Whiteley did not drag along in the English courts as has that of Thaw in this city. The cases were somewhat parallel. The victim in each case was wealthy, and there was a woman involved, for Whiteley's mistress was the aunt of his murderer. He was speedily convicted and sentenced to be hanged, and the British press teemed with boasts of the superiority of British judicial procedure. Then came letters in the press asking that the death sentence be commuted; and doubtless to the surprise of the promoters of the plan it has succeeded, for the Home Secretary has reduced the penalty to imprisonment for life. And now the press is full of criticism. They say that there was no pal-

liation for the crime and no recommendation for mercy from the court. This seems a case in which the weakness of the Home Secretary was deceived by what appeared a popular demand expressed in certain yellow journals. We have carefully abstained from discussing the merits of the Thaw case while the trial is in its tedious progress, more to the glorification of the leading lawyers than to the ends of justice. It is enough to express the hope that if the insanity commission now sitting should decide that Thaw is sane enough to be tried, the jury will stick to law and facts, and not assume that any "unwritten law" may protect one who has slain his fellow man.

Oklahoma

It would seem as if the members of the Oklahoma Constitutional Convention were determined to form an instrument which Congress would surely not accept. A Republican Congress—or, for that matter, a Christian Congress—cannot accept a constitution which makes a distinction of races, whether in education or traffic. That is enough and final. But, as if the members of the convention were afraid that Congress might swallow that denial that men of all races are created equal, another provision was put in which has not its parallel anywhere, in the following stipulation:

"No officer, soldier or marine of the Regular Army or Navy of the United States shall be entitled to vote at any election in this State; provided that this section shall not be construed to include members and officers of the State militia."

Such an insult is incredible. No active or retired officer or soldier or marine could have the right of suffrage in the State of Oklahoma. General Grant could not have voted, but General Lee could, just to take the two leaders in our Civil War. Or, to take two retired officers, Gen. O. O. Howard could not vote, nor Admiral Dewey, if either should care to take up his residence in that State made so ridiculous by its representatives. There are retired army men in Oklahoma, and Rough Riders with Roosevelt, who are pretty sure neither the President nor Congress will accept such a provision. If the negro protest would not prevail, that of the soldiers certainly would.

Colonial Relics

An exceedingly interesting collection of Colonial relics has been gathered together by the Colonial Dames of the State of New York for exhibition at the approaching Jamestown Exposition. The collection is now on view at the Metropolitan Museum of Art thru the courtesy of Sir Caspar Purdon Clarke. The committee in charge include as active workers Mrs. Elihu Chauncey, Mrs. E. G. Janeway, and Mrs. William Robison. These ladies have assembled Colonial silver made prior to 1800, including a number of silver tankards from the Phillipse, Van Rensselaer, De Peyster, Irving and other famous families; curious funeral spoons, with engraved inscriptions, made by Hutton, of Albany, and punch ladles containing coins of George II. and III. set in the bottoms thereof. Other units of the collection that are of especial interest and value are two horn books, one of which bears letters engraved on ivory, a copy of John Eliot's famous Indian Bible circa 1693, two sketch books of John Trumbull, a copy of *The Pennsylvania Gazette* printed by Benjamin Franklin at Philadelphia in 1758, a fine showing of political cartoons issued about the time of the Boston Tea Party, nine book plates of the Colonial period engraved by H. Dawkins, P. Revere, N. Hurd, P. Maverick, Thomas Johnson, T. Smith and others; a portion of the John Boyd Thatcher collection of commissions, documents, autograph letters and portraits; a case containing silhouets of famous Colonial personages, a silhouet ring, some smoked silhouets, ivory miniatures, watches, fans, mourning lockets, mourning rings and bracelets, seals, snuff boxes, heavy silver spectacle frames, knee buckles, bead bags, Revolutionary scales for weighing money, a pie-crust cutter of ivory, compass, mother-of-pearl fob, tortoise-shell snuffbox, one of General Washington's camp services consisting of forty-one pieces, including pewter plates, porringers, etc., all stamped with the English hallmark; an hour-glass dated 1765, Colonial costumes, bedspreads, a remarkably fine sampler with pictorial embroidery, some Indian wampum circa 1524, a baptismal basin with Dutch inscription, documents bearing the hated stamps issued under the British Stamp Act, old

maps contemporaneous with the Colonial period, and almanacks and Colonial school books. If the other States send as interesting a collection to the Jamestown Exposition as New York, the combined exhibit will be the best of its kind ever shown in America.

Lodging House Reform

Between six and seven million lodgings are sold annually at prices ranging from 5 to 25 cents per night in the 130 lodging houses of New York City and Brooklyn. In all the cheapest lodging houses ventilation is abominable, the beds, bedding and floors filthy, and the sanitary conditions such as to frequently cause the communication of diseases. The Department of Health has recently adopted new rules providing for clean sheets and pillow cases each day; adequate ventilation at all times; airing of dormitories and rooms by means of open windows from 10 a. m. until 2 p. m.; floors, hallways and stairways are to be thoroly scrubbed or wet-swept once a day; the required cubic air space is increased so as to cause a material reduction in the number of beds in the overcrowded dormitories; and washrooms on each floor must be provided with ample bathing accommodations, accessible to lodgers at all hours free of charge. This series of rules and regulations, if enforced, means for the lodging houses a betterment comparable in a sanitary way to many of the changes brought about a half-dozen years ago in the tenement houses. It is extremely significant, moreover, that in this instance the Department of Health has requested and obtained cooperation from the Joint Application Bureau, that department of the work of the Charity Organization Society and the Association for Improving the Condition of the Poor that aids and advises all homeless applicants. It is a good illustration of how things should be done, the public department inviting the private organization to suggest changes that the public department can then amend, adopt and enforce. As lodging house conditions are pretty bad in all our large cities, this forward step of New York should serve as a shining example.

From Old Tarsus

Among the papers which will be read this week at the meeting of the American Oriental Society is likely to be one by Prof. James A. Montgomery, of the University of Pennsylvania, which illustrates what are the fresh discoveries in the East which such expeditions as that soon to be conducted by Professor Sterrett are likely to find. This is a very old Aramaic inscription found by Mr. J. R. Metheny, carved on the smooth face of the rock, only a very short distance north of the port of Mersina, in northern Syria, and west of Tarsus. The inscription may be as old as 600 or 700 B. C., and is thus translated by Professor Montgomery:

"Up to here is the boundary of Ranal,
And whoever thou art who (wouldst molest it)
(Will restrain) him Baal of the heavens,
And the Earth, the Moon and the Sun,
And so let him go about his own business."

It marks the boundary of a kingdom, and is valuable as showing how the Baal, or Lord, of heaven and earth was regarded as the chief god, while the Assyrian Moon and Sun came next in rank and order. It helps us in both ancient geography and religion, besides being a very early specimen of the language and epigraphy.

A Free Church in a Free State

About a year ago a Provincial Synod was held in Milan, under the guidance of Cardinal Ferrara, the Archbishop of that city. In a brief addressed to him, Pope Pius X. condemned a pastoral letter of Mgr. Bonomelli, Bishop of Cremona. That liberal-minded prelate advocated for Italy the same status as is enjoyed in the United States by the Catholic Church, and also in France since disestablishment. Recent cable despatches from Rome give occasion to praising Pius X. for his steadfastness in following Leo XIII.'s expressed effort to win the clergy of France to the republic. It seems bewildering. The doctrine of a free church in a free state is condemned by the fiftieth proposition of the Syllabus. As a result the status of the Catholic Church here and elsewhere, where concordats exist not, is against Rome's teaching. Pius X. condemns that status in France

today, while the cable despatches assure us he approves it in the United States. The Catholic Church is a theocracy, of whose very essence is the doctrine of Boniface VIII. ("Unam Sanctam"); Pius IX. ("Apostolicæ Sedis"); Leo XIII. ("Encyclical on the Christian State"). The Church is supreme and the State her handmaid; the Church is likened to the soul, the State to the body. What is reprobated in France is equally reprobated in the United States. To shield the evident contrary practices there is needed the famous axiom, *"tolerari posse."*

Our American youth of both sexes flow in such shoals to Germany for education in all possible fields of study that it has never occurred to us that the tide might be reversed, and German students might invade our American universities. Why not? Our universities now claim to be equal in training to those abroad; and if our young men and women go to Berlin to learn German, there must be a considerable number of German youth who want to learn English. The report that Emperor William's fifth son, after his period in Bonn, will take a year or so in Harvard surprises us as with novelty. He will be welcome. If he enters next September he will be a classmate of President Roosevelt's oldest son, and their intimacy may possibly be an international advantage. We are very glad to have the two countries becoming more sympathetic. German immigrants are among our best citizens, and our President and the German Ambassador are the closest friends.

Because the New York *Evening Post* has ever since William Cullen Bryant's editorship, which is as far as living memory goes back, held a unique position in the American press for thoughtful, scholarly, courageous and conservative leadership, we rejoice that its success has required its removal to its new thirteen-story building on Vesey street. It will occupy the three upper floors, and we have never seen editorial and business offices or a pressroom lighter, more commodious or better fitted for the uses of a great paper. *The Evening Post* is more than fifty years older than THE INDEPENDENT—and we shall celebrate our sixtieth anniversary next year. No paper has exerted a greater influence than has our elder neighbor for all honesty and purity, and even its failings have leaned to virtue's side. May it long continue to prosper!

One of the unexpected evils of the present system of specializing in education appears in the growing difficulty complained of in finding suitable principals to take charge of high schools. Specialists for any branch of instruction are easy to find, but men who have a wide education, so that they can judge of the methods and success in all the branches are found to be quite too few. Physicians are valued for family practice who are not specialists, and such teachers are much needed.

It is clear that the Northern Presbyterian and the Cumberland Presbyterian Churches are completely united, for we observe that the preacher for the next meeting of the United General Assembly at Columbus, O., which opens on May 16th, is the Rev. Ira Landrith, LL.D., who was the Moderator of the last Cumberland Presbyterian General Assembly. The clerks of the two last Assemblies unite in the call for this first meeting of the two in Columbus.

Last year the *Tribune* Fresh Air Fund sent nearly eight thousand children from this city to homes in seven States for a fortnight's country rest and enjoyment. For thirty years this beautiful charity has been directed by the Rev. Willard Parsons, who must now withdraw, and the management is to be taken up by our neighbor, Rev. John B. Devins, editor of *The Observer*. A better man could not have been found to succeed the originator of this charity.

Easter Sunday proved a good day for the churches to be recognized by their members as public benefits. In this city Dr. Stimson's Manhattan Congregational Church burned its $70,000 mortgage, and Dr. Parkhurst's Presbyterian church added $53,000 to its endowment.

Insurance

Concerning a Mail Contract

In a brief article on this page, on March 14th, concerning the contribution of George W. Perkins and the New York Life Insurance Company to the Republican campaign fund, there was mention of an assertion made by critics of Mr. Perkins and published at considerable length by a New York daily paper that, ten months after the reception of the contribution, Mr. Cortelyou, then Postmaster-General, executed a ten-year contract with the International Mercantile Marine Company (of which Mr. Perkins was an influential director) for carrying the mails, at a price yielding about $750,000 a year. Reference was made to this assertion merely because it was part of the current history of this interesting case.

The contract in question, it should now be explained, was made in obedience to the provisions of the act of March 3d, 1891, and Mr. Cortelyou did not know until long after it was executed that Mr. Perkins was connected with the company. The following statement is made upon official authority:

Ocean mail service now performed by the International Mercantile Marine Company, New York to Southampton, commenced under the original contract (made pursuant to the provisions of the act of March 3d, 1891), October 12th, 1895, the first contract terminating October 11th, 1905. The fleet consists of four vessels of the first class. This class includes iron or steel screw steamships capable of maintaining a speed of twenty knots an hour in ordinary weather, and of a gross registered tonnage of not less than 8,000 tons, the vessels to be built on specifications approved by the Navy Department and to be available as auxiliary cruisers in time of war. The compensation authorized by law is $4 per mile of outward voyage, and the vessels are required to carry, in addition to the mails offered, mail messengers in charge of mails without additional compensation. On June 1st, 1905, bids were invited for continuing the service, and upon proposals duly submitted a new contract was awarded to the International Mercantile Marine Company for service to commence October 12th, 1905, period ten years. *The bid of this company was the only one received*, and its acceptance was recommended by all the postal officials having to do with the subject. Postmaster-General Cortelyou directed an insertion in the contract of a clause giving to the department the option of canceling the contract after five years upon notice to the company one year in advance. This gave the Government an advantage it did not possess under the previous contract.

Under the general law, all vessels sailing under the American flag are entitled as compensation for carrying the mails, outward voyage, full sea and inland postage, the obligation resting upon each of the countries of the Universal Postal Union to pay for the delivery of its mails to the country of destination.

If service performed by the vessels of the International Mercantile Marine Company had been paid for upon the basis of the weight of mails conveyed, under the general law, instead of under contract based upon the law of 1891, the company would have received for the year ended June 30th, 1904, in excess of the compensation actually paid under contract, $61,565.28; for the year ended June 30th, 1905, $106,890.76; and for the year ended June 30th, 1906, $147,904. As the weight of the mails is steadily increasing, it is obvious that the saving to the Government will continue to increase year by year.

Causes of Fires in Chicago

The following table of causes of fires in Chicago from January 1st to September 15th, 1906, has been compiled by the *Argus:*

Boiling oil	16
Careless use of matches	402
Careless use of sulphur	2
Carelessness with candle	10
Christmas tree	2
Cigar stub	37
Defective flues	133
Electric wires	48
Explosions of chemicals	8
Explosions of gas	10
Explosions of gasoline	197
Fireworks	47
Gas jet	56
Hot ashes	30
Hot box	13
Incendiary	3
Lightning	21
Oil lamps	81
Oil stove	38
Overheated furnace	75
Overheated stove	107
Plumber's torch	4
Sparks from chimneys	159
Sparks from locomotives	31
Spontaneous combustion	128
Supposed incendiary	52
Thawing water pipes	23
Unknown	838
Total	2,634

It will be observed that the careless use of matches continues in the lead as the greatest known hazard. Every user of matches who reads these lines may well resolve with cast-iron determination to be more careful because of this table.

Financial

The Securities Market

On the first day of last week prices fell sharply at the Stock Exchange, following considerable declines at the earlier market in London. In some instances lower figures than those of the panicky 14th were reached. Money on call rose to 14 per cent. Sales on Monday were nearly 1,700,000 shares. There was a recovery on Tuesday, and for the remainder of the week an irregular movement. At the close on Friday (the Exchange was not open on Saturday) the active list showed net gains for the week, some examples being as follows: New York Central, $2\frac{3}{4}$; Pennsylvania, $3\frac{1}{2}$; Reading, $5\frac{1}{4}$; Southern Pacific, $3\frac{1}{2}$; Union Pacific, $5\frac{5}{8}$; Atchison, $2\frac{3}{8}$; Great Northern, $6\frac{3}{4}$; Steel common, $1\frac{1}{4}$. The most interesting recovery was seen in the case of Canadian Pacific, which rose to $182\frac{1}{2}$ and made a net gain of $24\frac{1}{4}$ for the week, probably upon the "covering" of those who had raided the stock in the week preceding. The close of the month, and of the year's first quarter, shows, for sixty active stocks, an average decline of $24\frac{3}{4}$ per cent. from the highest prices of 1906, altho there has been no loss of earning power, current dividend payments are higher than last year's, and our leading manufacturing industries are very busily engaged. A favorable influence was exerted upon the market last week by a court decision upholding the Great Northern's right to issue $60,000,000 of new stock, and by the Treasury's release of funds. On the other hand, a great railway strike was threatened, and there was pessimistic talk about the effect of State legislation upon the railways. The failure of the old Corbin banking house had little weight; the house was engaged mainly in real estate transactions and was carrying a load of beach property. Secretary Cortelyou made further and commendable efforts to release for business uses a part of the money withdrawn and locked up by the current operations of Government agencies.

Low Rate Bonds

The Comptroller of the State of New York has invited proposals for $5,000,000 in Canal Improvement bonds, at 3 per cent., the principal payable forty years hence. As no price less than par can be accepted, the result is awaited with some curiosity. Owing to the decline in the prices realized for bonds issued by New York City, legislation is desired that will permit an issue of these municipal 4 per cents. at less than par. A recent offering of Philadelphia $3\frac{1}{2}$ per cents met scarcely any response. St. Louis has been unable to find takers, within the limit, for bonds bearing interest at 3.65 per cent. The need of higher rates for municipal issues is due to the effect of the recent world-wide scarcity of loanable funds, and the accompanying rise of rates for loans on call or for short terms. Municipal securities are no longer attractive at the prices prevailing not long ago, because investors can do better. Municipalities will probably find it necessary to adapt the provisions of their new issues to the requirements of the market.

....The valuation of public service corporation franchises in New York City for the special franchise tax has been increased from $361,479,300 in 1906 to $466,855,000 for 1907.

....On January 26th the surplus and profits of the National Park Bank of New York, of which Richard Delafield is president, amounted to $8,213,704.99. In the report published this week the surplus and profits are $8,415,343.14, showing a gain of $201,638.15 in surplus and undivided profits since January 26th.

....The Royal Bank of Canada, which has more than eighty branches (eight of them in Cuba), publishes its thirty-seventh annual report in a handsome volume of nearly seventy pages, finely illustrated, which contains, in addition to a list of stockholders and much other information about the bank, a collection of useful Canadian statistics and the schedules of the new Canadian tariff. The bank established twenty-two new branches last year. Its paid up capital is $3,900,000 and its reserve fund $4,390,000. Deposits amount to $32,464,685, and the assets are $45,437,516. Thomas E. Kenny is the president.

The Independent

VOL. LXII NEW YORK, THURSDAY, APRIL 11, 1907 No. 3045

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Harriman's Letter to Mr. Webster

President Roosevelt caused to be published, on the 2d, parts of a letter in which he had declined the invitation of the Illinois Manufacturers' Association to deliver an address at Springfield on the railway question. With it were long extracts from two of his public addresses and two of his messages, setting forth his railway policy. He had said recently to callers that in his future course he should not deviate a hand's breadth from the course he had pursued and was still pursuing. It was asserted by authority, however, that he did not intend to take or recommend any action that would affect the safety and stability of railway securities already issued.——On the morning of the 2d, there was published in the New York *World* a long, private letter, sent, on January 21st, 1906, by Edward H. Harriman, president of the Union Pacific and Southern Pacific roads, to Sydney Webster, a prominent lawyer and his intimate friend. A stenographer named Hill, whom Mr. Harriman had discharged, wrote out the letter from his notes and sold it for publication. Hill has been arrested and has confessed. It appears that Mr. Webster had warned Mr. Harriman against being drawn into politics. Replying, Mr. Harriman said (after a reference to the insurance investigation), that his "being made at all prominent in the political situation" was "entirely due to President Roosevelt and because of my taking an active part in the autumn of 1904 at his request, and his taking advantage of conditions then created to further his own interests." The letter continued as follows:

"About a week before the election in the autumn of 1904, when it looked certain that the State ticket would go Democratic, and was doubtful as to Roosevelt himself, he, the President, sent me a request to go to Washington to confer upon the political conditions in New York State. I complied, and he told me he understood the campaign could not be successfully carried on without sufficient money, and asked if I would help them in raising the necessary funds, as the National Committee, under control of Chairman Cortelyou, had utterly failed of obtaining them, and there was a large amount due from them to the New York State Committee.

"I explained to him that I understood the difficulty here was mainly caused by the up-State leaders being unwilling to support Depew for re-election as United States Senator; that if he, Depew, could be taken care of in some other way, I thought matters could be adjusted and the different contending elements in the party brought into close alliance again. We talked over what could be done for Depew, and, finally, he agreed that if found necessary he would appoint him as Ambassador to Paris.

"With full belief that he, the President, would keep this agreement, I came back to New York, sent for Treasurer Bliss, who told me that I was their last hope, and that they had exhausted every other resource. In his presence I called up an intimate friend of Senator Depew, told him that it was necessary in order to carry New York State that $200,000 should be raised at once, and if he would help I would subscribe $50,000. After a few words over the telephone, the gentleman said he would let me know, which he did probably in three or four hours, with the result that the whole amount, including my subscription, had been raised."

The checks were given, Mr. Harriman went on to say, to Treasurer Bliss, who took them to Chairman Cortelyou. "If there were any among them of life in-

surance companies, or any other like organizations, of course Cortelyou must have informed the President."

"This amount enabled the New York State Committee to continue its work, with the result that at least 50,000 votes were turned in the city of New York alone, making a difference of 100,000 votes in the general result. There are between 2,200 and 2,300 districts in Greater New York, and in a campaign such as that the expenditure of, say, $50 in each district for campaign purposes, not including the watchers on election day, would take more than $100,000."

Some time in December, 1904, after the election, while on his way from Virginia to New York, Mr. Harriman continued, he stopped in Washington and had a short talk with the President:

"He then told me that he did not think it necessary to appoint Depew as Ambassador to Paris, as agreed; in fact, favored him for the Senate. I had not expected that he was the one [to decide] as to what would be necessary, but he arrogated that to himself, and I, of course, could say nothing further. After that I used what influence I could to have Depew returned to the Senate, as I considered there had been an implied obligation which should be lived up to.

"This is the way I was brought to the surface in the political matters. . . . . I was brought forward by Roosevelt in an attempt to help him, at his request, the same as I was in the insurance matter by Hyde and Ryan by their request for my help. . . . .

"Ryan's success in all his manipulations, traction deals, tobacco combination, manipulation of the State Trust Company into the Morton Trust Company, the Shoe and Leather Bank into the Western National Bank and then again into the Bank of Commerce—thus covering up his tracks—has been done by the adroit mind of Elihu Root, and this present situation has been brought about by a combination of circumstances which has brought together the Ryan, Root, Roosevelt element.

"Where do I stand?"

Mr. Harriman was informed on the 1st that this letter was to be printed. He sought in vain to prevent the publication of it. Hill, the stenographer, was arrested on the 4th.

President Roosevelt's Statement in Reply

Mr. Roosevelt responded promptly by publishing, on the following day, a letter written in October last, in which he had characterized the leading assertion of the letter to Webster as "a deliberate and wilful untruth." Congressman James S. Sherman was chairman of the Republican Congressional Committee in the campaign of last fall. In the first week of October he asked Mr. Harriman for a contribution. Mr. Harriman refused and at the same time said harsh things about the President, attacking his railway policy and asserting that he had broken a promise. Mr. Sherman reported this to the President, who, in a letter dated October 8th, addressed to Mr. Sherman and filling nearly three newspaper columns, made a statement as to his relations and correspondence with Mr. Harriman. The President says in this letter:

"I shall begin by repeating what you told me he [Mr. Harriman] said to you on the occasion last week when you went to ask him for a contribution to the campaign. You informed me that he then expressed great dissatisfaction with me and said, in effect, that so long as I was at the head of the Republican party or it was dominated by the policies which I advocate and represent he would not support it, and was quite indifferent whether Hearst beat Hughes or not, whether the Democrats carried Congress or not. He gave as a reason for his personal dislike of me partly my determination to have the railroads supervised and partly the alleged fact that after promising him to appoint Depew Ambassador to France I failed to do it; and I understood you to say that he alleged that I made this promise at a time when he had come down to see me in Washington, when I requested him to raise $250,000 for the Republican Presidential campaign, which was then on.

"Any such statement is a deliberate and wilful untruth—by rights it should be characterized by an even shorter and more ugly word I never requested Mr. Harriman to raise a dollar for the Presidential campaign of 1904. On the contrary, our communications as regards the campaign related exclusively to the fight being made against Mr. Higgins for Governor of New York, Mr. Harriman being immensely interested in the success of Mr. Higgins because he regarded the attack on Mr. Higgins as being really an attack on him, Mr. Harriman, and on his friend, Governor Odell; and he was concerned only in getting me to tell Mr. Cortelyou to aid Mr. Higgins so far as he could, which I gladly did."

Mr. Harriman had urged him to promise to make Senator Depew Ambassador to France, but he had told Mr. Harriman he did not think it would be possible for him to do this, or to appoint James H. Hyde, for whom men "representing the big financial interests" had written to him, and whom Mr. Harriman was willing to support. The President gives parts of the letters which passed between them, saying: "His and my letters now before me, of the fall of 1904, run as follows:

On his return from spending the summer in Europe, on September 20th, he wrote me stating that if I thought it desirable he would come to see me at any time." [This letter had been preceded by an invitation from the President, on June 29th, which Mr. Roosevelt omitted and which Mr. Harriman afterward supplied. In the letter of September 20th, there was a reference to this invitation. This the President omitted.] The President shows that on September 23d he answered that there was at present nothing for him to see Mr. Harriman about, altho he would have liked to discuss with him "one or two points in my letter of acceptance." On October 10th, the President wrote: "In view of this trouble over the State ticket in New York, I should very much like to have a few words with you." He invited Mr. Harriman to lunch or dinner. The trouble, he says, was "the bolt against Higgins." Two days later, Mr. Harriman wrote that he would come "the first of next week." But on October 14th, the President sent him the following letter:

"My Dear Mr. Harriman—A suggestion has come to me in a roundabout way that you do not think it wise to come on to see me in the closing weeks of the campaign, but that you are reluctant to refuse, inasmuch as I have asked you. Now, my dear sir, you and I are practical men, and you are on the ground and know the conditions better than I do. If you think there is any danger of your visit to me causing trouble, or if you think there is nothing special I should be informed about or no matter in which I could give aid, why, of course, give up the visit for the time being, and then a few weeks hence, before I write my Message, I shall get you to come down to discuss certain Government matters not connected with the campaign.

"With great regard, sincerely yours."

This letter, the President says, is "incompatible with any theory that I was asking Mr. Harriman to see me in my own interest, or that I intended to make any request for help from him." He quotes a letter of November 30th from Mr. Harriman, who said he was very apprehensive about what the President should say about the railways in his forthcoming Message, and advised that "no reference be made to the subject"; also a letter of his own, of the same date, in which he informed Mr. Harriman that his mind was made up on that question, and explained at length how he had arrived at his conclusions. He had had in view a discussion with Mr. Harriman of currency legislation, and "had not thought of discussing railroad matters" with him, altho he "would have been delighted to do so." On December 2d, Mr. Harriman wrote again, arguing against any increase of the power of the Interstate Commerce Commission. "I was unable," says the President, "to agree with his views." Mr. Harriman, he adds, professed to be acting in the interest of Governor Odell, as to the Depew appointment, but Governor Odell, shortly after December 2d, shifted his support and, on December 10th, sent him a very earnest personal request (the letter is given in full) for the appointment of James H. Hyde. At the close of the long letter to Mr. Sherman, the President speaks as follows of Mr. Harriman's remarks to Mr. Sherman when the latter asked him "if he thought it was well to see Hearstism and the like triumphant over the Republican party":

"You inform me that he told you that he did not care in the least, because those people were crooks and he could buy them; that whenever he wanted legislation from a State Legislature he could buy it; that he 'could buy Congress' and that if necessary he 'could buy the judiciary.' This was doubtless said partly in boastful cynicism and partly in a mere burst of bad temper because of his objection to the Interstate Commerce law and to my actions as President. But it shows a cynicism and deep-seated corruption which make the man uttering such sentiments, and boasting, no matter how falsely, of this power to perform such crimes, at least as undesirable a citizen as Debs, or Moyer, or Haywood.

"It is because we have capitalists capable of uttering such sentiments and capable of acting on them that there is strength behind sinister agitators of the Hearst type. The wealthy corruptionist, and the demagog who excites, in the press or on the stump, in office or out of office, class against class and appeals to the basest passions of the human soul, are fundamentally alike and are equally enemies of the Republic. I was horrified, as was Root, when you told us today what Harriman had said to you."

The President now says that after writing this letter to Mr. Sherman he was assured that Mr. Harriman "had not made the statements which Mr. Sherman credited him with making," but that, as the same statements appear in the Webster letter, he publishes what he wrote to Mr. Sherman in October.——Commenting upon all this, Mr. Harriman says:

"I cannot withdraw anything in the letter to Mr. Webster." The President, he continues, does him injustice in trying to convey an impression that the interview in the fall of 1904 was of his own seeking. He publishes Mr. Roosevelt's letter of June 29th, inviting him, and argues that the entire correspondence supports his assertions about the request for money. It is false, he says, that he made the cynical remarks attributed to him. ——"I feel particularly fortunate," said Mr. Roosevelt when he gave the correspondence to the public, "that I have been attacked within the last few days by both ex-Senator Burton and Mr. Harriman."

Story About a Reactionary Plot

Following the publication of the Harriman correspondence, interesting statements were made at the White House, where the President talked freely with newspaper men, with the understanding that what he said should not be published in quotation marks. Statements were also given out there "by authority." Inevitably, the substance of these statements and of the President's remarks became involved in a mass of gossip. It was asserted "at the White House" that Mr. Harriman's interest in the campaign of 1904 was due to his desire to be appointed Senator in Mr. Depew's place. Contributions from several corporations were declined, it was said, by Chairman Cortelyou, with one of $20,000 from a man who wanted to be appointed Minister to Belgium. The controversy with Alton B. Parker concerning contributions was reviewed, with comments suggested by recent events. But the most sensational statement was one (published on the 4th) that Mr. Roosevelt and his friends had discovered "a rich man's conspiracy" to control the Presidential nomination next year in the interest of the "reactionaries." There was evidence, it was asserted, of a movement to defeat the President's policies and any representative of them by a Harriman-Rockefeller-Hearst combination, which had a fund of $5,000,000 for its campaign. The conspirators were to seek control of the nominating convention under cover of delegates ostensibly committed to Mr. Roosevelt or to "favorite sons" of States. After the final declination of Mr. Roosevelt, a majority was to be used for a reactionary candidate. The whole scheme, it was said, had been disclosed at a private dinner in Washington to a friend of the President by a Senator, and the conspirators were already at work in Pennsylvania, in Ohio and elsewhere. Altho names were not given "by authority," it was asserted in dispatches to the press thruout the country that the plans had been divulged by Senator Penrose at a dinner given in February by Senator Bourne, and that the recipient of the tale had been Secretary Loeb. Senator Penrose promptly denied that he had said anything of the kind or had attended a dinner at which such a statement was made by anybody. He pointed to his support of the President's policies. Other Senators, said to have been guests at the dinner, made similar denials. It was generally admitted that, whether there was such a combination or not, it would be difficult hereafter to elect delegates professing to stand for Mr. Roosevelt or the representative of his policies but really hostile to both.——W. D. Haywood, soon to be tried in Idaho for murder, says that the President's reference to him in the letter to Mr. Sherman has done him irreparable injury. The organization of labor unions formed for the defense of Haywood, Moyer and Pettibone has sent to the President an emphatic protest.

Chicago's Street Railways

At the municipal election in Chicago on the 2d, inst., Frederick A. Busse, Republican, who has been postmaster of the city for some time past, was elected Mayor by a plurality of 13,010 over Edward F. Dunne, Mayor during the last two years. Mr. Busse is the first Mayor elected for a term of four years. About 330,000 votes were cast. The ordinances designed to end the street car controversy, which were recently passed by the Council over Mayor Dunne's veto, and which the street railway companies had accepted, were approved at the polls by a majority of 33,000. They provide that in lieu of all existing franchises or franchise claims the companies shall have a franchise for a term of twenty years, with the condition that the city may buy

the entire property at any time after giving six months' notice by paying $50,000,000 and the cost of extensive improvements which the companies are required to make. Upon these improvements about $40,000,000 is to be expended under the supervision of a board of three persons, the city appointing one, the companies another, and these two agreeing upon the appointment of the third member. There are to be universal transfers, and the city is to receive annually 55 per cent. of the net earnings. Mayor Dunne and the Democrats, or a majority of them, stood for municipal ownership by purchase or condemnation. Fear that an attempt to carry out any one of the municipal ownership plans advocated or suggested by the Mayor would involve years of litigation and prevent any improvement of the service, which is extremely unsatisfactory, led many who preferred municipal ownership, it is said, to vote for the ordinances. Mayor Dunne says he was defeated "by the money power, not only of this city, but of the whole United States." The campaign was one of great bitterness. The only newspapers supporting Mayor Dunne were those of Mr. Hearst, who had brought to the city several of the editors and cartoonists usually employed by him in New York. He sued the *Tribune* for libel, asking $2,500,000 damages. Mr. Hearst himself, his chief editor and several of his cartoonists were sued for libel by Mr. Busse. It is expected that from $15,000,000 to $20,000,000 will be expended upon improvements by the companies in the coming twelve months.

A Great Strike Averted

The threatened strike of the conductors and trainmen on forty-two railways in the West was averted last week by the efforts of Interstate Commerce Commissioner Knapp and Labor Commissioner Neill, acting as conciliators under the provisions of the Erdmann act. After their arrival in Chicago, the interrupted conferences were resumed. Concessions were made by each side, and on the 4th an agreement was reached. The demand for a nine-hour day was withdrawn. The wage increase granted is about 10 per cent., and the companies voluntarily included the locomotive firemen, who were not among the 48,000 men affected by the original demand. The increase amounts to about $5,500,000 a year. Both parties express their approval of the working of the Erdmann law. In a telegram to President Roosevelt, Mr. Knapp declared that the settlement of the controversy was "a distinct triumph for Government mediation."—— By a readjustment of its payroll, the Baltimore & Ohio Railroad Company has increased the amount paid to its employees by about $3,000,000 a year.

The Philippine Islands

It is asserted in press dispatches from Manila that, in preparing for the approaching election of members of the Legislative Assembly, the two leading parties (the Progressive and the Independent) stand in some places as friends and in others as enemies of American rule, their attitudes being determined by local sentiment; also, that in some provinces, political use is made of the reported desire of Japan to possess the islands. Proof of a revival and reorganization of the Katipunan, an insurrectionary society, is said to have been found in Laguna province (Luzon); the leader of the society is Dominador Gomez, a well known agitator, and its remodeled seal shows the clasped hands of a Japanese and a Filipino. At Tayabas, 62 miles from Manila, there has been found a factory, the dispatches say, in which uniforms are being made for Filipinos who desire to fight for the Japanese.

The War in Central America

At the end of last week President Bonilla was still at Amapala, where he was surrounded by the Nicaraguan forces. The bombardment of that port by Nicaraguan gunboats had ceased, owing, it is reported, to the presence of the American warships "Chicago" and "Princeton," or to protests made by Philip S. Brown, secretary of the American Legation, who is said to have appeared as a representative of Salvador Inquiry has been made at Washington as to his authority for this action. Dispatches from Salvador say that the surrender of Tegucigalpa was followed by brutal excesses in that city on the part of the victorious army, and that the children

of Gen. Teofilo Carcamo were hanged. This is denied by President Zelaya. On the 6th there were conferences at Washington with reference to another diplomatic effort for the restoration of peace. Some predict that if Nicaragua declines to become a party to a peace agreement, her army will be opposed in the field by the forces of her four neighbors.

Program of The Hague Conference

After a year spent in diplomatic discussion over what subjects are to be considered at the second Hague Conference the Russian Government issued, on April 4th, a circular note stating the positions taken by the Powers in regard to extending the scope of the Conference. It will be remembered that the most prominent of the questions posited by Russia for the first Hague Conference was the reduction of armament by mutual consent of the European Powers. In the program drawn up by Russia for the second Conference this subject was entirely omitted on the ground that its fate at the first Conference proved that it was a fruitless topic of discussion. The following is the original program presented to the Powers by Russia and to it she still adheres:

1. Improvements to be made in the provisions of the convention relative to the peaceful settlement of international disputes as regards the Court of Arbitration and the International Commission of Inquiry.

2. Additions to be made to the provisions of the convention of 1899 relative to the laws and customs of war on land, among others those concerning the opening of hostilities, the rights of neutrals on land, etc. Declarations of 1899. One of these having expired, question of its being revived.

3. Framing of a convention relative to the laws and customs of maritime warfare, concerning: The special operations of maritime warfare, such as the bombardment of ports, cities and villages by a naval force, the laying of torpedoes, etc.; the transformation of merchant vessels into warships; the private property of belligerents at sea; the length of time to be granted to merchant ships for their departure from ports of neutrals or of the enemy after the opening of hostilities; the rights and duties of neutrals at sea, among others the questions of contraband, the rules applicable to belligerent vessels in neutral ports; destruction, in cases of vis major, of neutral merchant vessels captured as prizes; in the said convention to be drafted there would be introduced the provisions relative to war on land that would be also applicable to maritime warfare

4. Additions to be made to the convention of 1899 for the adaptation to maritime warfare of the principles of the Geneva Convention of of 1864.

But the peace movement had in many countries attained too much force for the question of armament to be ignored in this fashion. It was felt that the Peace Conference would be hardly deserving of the name if no effort was made at relieving the enormous and increasing burden of expenditure for army and navy. It had been expected that the second Conference would take a more advanced step toward international control and the maintenance of universal peace, so there was much disappointment when its program showed that it was to be more limited in its scope and timid in its aims than the first. Great Britain insisted upon introducing the question of limitation of armaments, and Spain and the United States ranged themselves by her side. Professor de Martens, the Russian authority on international law and a member of The Hague Court of Arbitration, visited the capitals of Europe to argue against the introduction of the question and to make such arrangements that any effectual action upon it, if it were introduced, would be checkmated. The result of his efforts appears in the following quotation from the latest note of the Russian Government:

"All the Powers to which the Imperial Government comunicated in April, 1906, its tentative program of the labors of the new conference have declared their adherence thereto.

"However, the following remarks have been made with respect to that program:

"The Government of the United States has reserved to itself the liberty of submitting to the second conference two additional questions, viz.: That of the reductions or limitation of armaments and that of bringing about an agreement to observe certain limitations in the use of force in collecting ordinary public debts accruing from contracts.

"The Spanish Government has expressed a desire to discuss the limitation of armaments, reserving to itself the right to deal with this question at the next meeting at The Hague.

'The British Government has given notice that it attaches great importance to having the question of expenditures for armament discussed at the conference and has reserved to itself the right of raising it; it has also reserved to itself the right of taking no part in the discussion of any question mentioned in the Russian program which would be unlikely to produce any useful result to it.

"Japan is of the opinion that certain questions that are not especially enumerated in the

program might be conveniently included among the subjects for consideration and reserves to itself the right to take no part in or withdraw from any discussion taking or tending to take a trend which, in its judgment, would not be conducive to any useful result.

"The Governments of Bolivia, Denmark, Greece, and the Netherlands have also reserved to themselves, in a general way, the right to submit to the consideration of the conference other subjects similar to those that are explicitly mentioned in the Russian program.

"The Imperial Government deems it its duty to declare, for its part, that it maintains its program of the month of April, 1906, as the basis for the deliberations of the conference, and that if the conference should broach a question that would appear to it unlikely to end in any practical issue it reserves to itself, in its turn, the right to take no part in such a discussion.

"Remarks similar to this last have been made by the German and Austro-Hungarian Governments, which have likewise reserved to themselves the right to take no part in the discussion by the conference of any question which would appear unlikely to end in any practical issue.

"In bringing these reservations to the knowledge of the Powers, and with the hope that the labors of the second Peace Conference will create new guarantees for the good understanding of the nations of the civilized world, the Imperial Government has addressed to the Government of the Netherlands a request that it may be pleased to call the conference for the first days of June."

It appears from this that Russia, Germany and Austria-Hungary will be the principal or the only Powers to take a decided stand in opposition to the consideration of the question of the limitation of armament. France has not followed her ally, Russia, in this matter, altho the French Foreign Office is apparently inclined to do so. The Paris *Temps*, which is usually inspired in its discussion of foreign affairs, has strongly opposed the introduction of the question on the ground that it cannot lead to any practical results and it would cause bitterness and increase the mutual suspicion with which the Powers regard each other. It further says that: "This continual talk of peace will eventually lead to the complete embroilment of Europe." But the peace party in France under Baron d'Estournelles de Constant is too strong to be disregarded, and in the Chamber of Deputies, M. de Pressensé will insist in behalf of the Socialists on the Government making its position clear. Germany has exerted pressure upon her ally, Italy, to secure her support at The Hague Chancellor von Bülow recently visited Italy for the purpose of conferring with Signor Tittoni, the Italian Foreign Minister, on this subject, and apparently with some effect, for the name of Italy does not appear in the Russian note given above, and it is reported that Italy will not follow England closely in this matter, but will introduce a separate proposal bearing on the limitation of armaments, but in a form less objectionable to the Powers. The United States, at the unanimous request of the American republics, will bring up in the conference the question of the Drago or Calvo doctrine, restricting the use of force in collection of debts due to foreigners. Secretary Root, at the instigation of Baron Rosen, the Russian Ambassador at Washington, has notified the South American republics to have their delegates ready at The Hague with full powers at the opening of the conference, as there is doubt about their being invited to join. It is required that the newcomers shall, as a condition of admission, have adhered to the three great treaties resulting from the first Hague Conference, namely, that providing for arbitration and mediation, the Geneva Convention and the rules for the government of maritime warfare. Among other questions which will come before The Hague will be the renewal of the prohibition against dropping bombs and explosives from balloons, which was adopted by the first Conference, but only for a period of five years; and the question of whether the Baltic can be made a closed sea in time of war. The treaty of 1857, to which the United States was a party, provides for "the entire freedom of the Sound and the belts in favor of foreign vessels and their cargoes," but it has been lately held by some of the Baltice Powers that the treaty relates to commercial vessels only. It is expected that the Conference will meet about June 15th.

The Russian Duma

So far the moderation of the Duma and its strict adherence to its constitutional functions have given no excuse for its dissolution, yet a strong and concerted effort is being made by the reactionaries to influence the Czar to such an action, and there are many rumors of its im-

pending success. Troops are being massed in St. Petersburg as they were just before the dissolution of the last Duma. The telegraph office at Tsarskoe-Selo is swamped with messages from all parts of the empire begging the Czar to dismiss this useless and seditious body. It has been disclosed that this apparently spontaneous outburst of indignation against the Duma is the result of schemes prepared by the League of the Russian People, a reactionary society organized for the purpose of checking the revolutionary movement. Mr. Purishkevitch, vice-president of the League and member of the Duma from Bessarabia, sent out a circular a week after the assembling of the Duma planning for such a manifestation upon a given signal. This signal, a black cross in the *Russian Banner*, the organ of the League, appeared on the same day that Dr. Jollos, the editor of a Liberal journal, was assassinated, presumably by a member of the League. Rumors are afloat, as they have been many times before, to the effect that the Czar is completely broken down in mind and body by anxiety, and that he is about to abdicate to be succeeded by a grand-ducal regency. In the meantime the Duma is proceeding with its regular order of business, the discussion of the budget. It is the monarchist Right instead of the revolutionary Left that is disorderly this time. Mr. Alexinsky, a Socialist member, in making a speech on the budget, was repeatedly interrupted by angry exclamations from the monarchists, who appealed to Speaker Golovin to prevent Alexinsky from insulting the nobility, but the Speaker called them to order instead. Finally, when Mr. Alexinsky read an extract from the *London Economist* criticizing the action of the Government in dissolving the last Duma as a breach of faith to foreign creditors. Count Bobrinsky, president of the Constitutional Conservative party, denounced the speech as treasonable and left the hall followed by twenty members of the Right. In presenting the budget to the Duma, April 2d, Minister of Finance Kokovsoff said that the costly war, the costlier revolution and the great famine had shaken the prosperity of the country, had weakened its industry and had dealt a staggering blow to its credit. The budget had been drafted on the basis of the most extreme economy. While the total expenditures, $1,236,000,000, showed a nominal decrease of $20,000,000 over 1906, the actual saving was almost $200,000,000. The Government was really spending last year $1,649,000,000, owing to the extraordinary expenses, famine relief, etc., instead of the $1,255,000,000 contemplated by the budget. The Minister defended the moderate nature of the various items of ordinary expenditure, the necessity for new appropriations for popular education, the colonization of Siberia, and so on, and said the extraordinary expenditure was $90,000,000 less than in 1906, altho the appropriation for famine relief had doubled. Without the consent of Parliament it was impossible to increase the revenue by new taxes, hence, tho the ordinary expenditures could be covered in the ordinary manner, credit operations were necessary in order to cover the extraordinary expenses, provide the money needed for the liquidation of the war expenses, famine relief and railway construction. This necessitated a new loan, but the Government hoped to be able to find the funds within the country. The discussion of the proposed budget was opened by ex-Minister Kuttler, who criticized the bureaucracy for its extravagance in court expenses and superfluity of officials. He said only 11 per cent. of the revenue was derived from direct taxes. The indirect taxes all bore with great harshness on the poor. He made a computation showing $575,000,000 in revenue was derived from the taxation of articles used almost exclusively by the poor, while only $185,000,000 was collected from articles of luxury. Even the direct taxes fell chiefly on the poor, two-thirds of the land tax being paid by the peasantry, while the city taxes were mainly paid by those who rented houses and apartments. In conclusion, M. Kuttler analyzed the public debt, amounting to $4,500,000,000, with an annual interest charge of $191,000,000, declaring that only $1,750,000,000 had been expended on railroads and productive works, while $2,750,000,000 had been spent for war adventures. The credit of the country would be restored if a constitutional regime was instituted and the power over the national purse was given to Parliament, as in other civilized countries. The

Constitutional Democrats wish to refer the budget to a committee but the Socialists have an amendment pending to reject it summarily. If this latter action is taken it may serve as an excuse for the dissolution of the Duma. One day in each week is devoted to the discussion of the land question, on which a hundred members, mostly peasants, are anxious to speak, altho there is no probability that anything can result from it. The Group of Toil proposes the nationalization of all the land in the Empire. The bill of the Constitutional Democrats involves the compulsory expropriation of all estates above a certain limit at a price to be fixed by commissions. The Minister of Agriculture has notified the Duma that both these plans are inadmissible to the Government which will maintain the inviolability of all landed property.

The Rumanian Revolt

The revolt of the peasants of Moldavia and Wallachia is now officially reported to be at an end. The reserves were called out, which had the double advantage of increasing the military force and decreasing that of the peasantry. Troops to the number of 136,000 are now under arms. The country was divided into zones and systematically traversed by companies of soldiers, who shot at sight all persons found looting or setting fire to buildings. According to the Government estimates the loss due to the destruction of crops, forests and buildings amounts to $6,000,000, but the injured land owners claim that it is much greater. Many of the peasants who had taken the oath of the insurgents regarded themselves as bound by it to continue the riots, but the Metropolitan of Bucharest issued a pastoral letter absolving them from their oath. At Bacleshti, near Craivou, the most desperate resistance was encountered by the battalion of infantry and battery of artillery sent against the village. The inhabitants turned out in mass, men, women and children, armed with rustic weapons, and charged the troops, who fired a volley, killing a large number. The villagers retreated, carrying off the dead and wounded. Half an hour later a funeral procession, bearing a coffin, emerged from the village, headed by the priest and parish clerk. When it reached the troops the peasants ceased their loud lamentations and charged. The soldiers fired and the peasants fled, leaving the coffin, which was empty, on the ground. Twice more the troops were attacked, and the village had to be bombarded before it was quieted.——King Charles, who was already in feeble health, is now so worn by sorrow over the troubles of his kingdom that his death is regarded as imminent.

Spain

King Alfonso has signed a decree dissolving the Cortes and ordering the assembling of the new Parliament May 13th. The election of the Chamber of Deputies will be held April 21st and the Senate May 5th. The recent elections for the electoral bodies that choose half the Senate have gone in favor of the Conservatives, and there is little doubt that the present Conservative Ministry will be supported in the next Cortes. The anti-clerical movement seems to have been checked, and the Liberals are discredited by their failure to lay aside personal squabbles and support their Ministry when it was in power. The King has organized a society of landowners for improving the condition of agriculture in Spain, and has created a National Defense Committee to reform the army and navy. The extensive emigration from Spain due to hard times is being checked by the Government. The agents of the Panama Canal Commission are having difficulty in getting more laborers for the Isthmus, and the steamship "Heliopolis," which was about to sail for Hawaii with 700 Andalusian families, was stopped in the harbor of Malaga on the ground that the accommodations and food were poor.——King Edward is to meet King Alfonso this week at Cartagena. A British squadron of seventeen vessels will act as escort to the royal yacht, and all the available warships of the Spanish navy have been called out to meet them.——Extensive preparations have been made to receive with the traditional ceremonies the heir to the Spanish throne, whose birth is expected this month. The King and Queen have, in accordance with custom, visited the seven sacred shrines of Madrid, alone and on foot.

A Constitution of the World

[THE INDEPENDENT presents the following tentative draft for a constitution of the world in anticipation of the National Peace and Arbitration Congress that meets in this city next week.—EDITOR.]

THE signatory nations to the following convention desiring to form a union for the purpose of establishing justice and of securing for themselves as well as for posterity the blessings of permanent peace, do ordain the following Constitution:

1. There shall assemble in the year 1915, and every fifth year thereafter, at The Hague, unless otherwise ordered by three-fourths of the signatory Powers, a General Assembly of the Nations.

2. Each nation shall be entitled to be represented in this Assembly by not less than two or more than seven persons chosen by each nation in such manner and for such a term as may seem to it expedient.

3. Each nation shall have one vote in the General Assembly of the Nations.

4. The territorial and political integrity of each nation represented in the Assembly shall be respected by all nations represented.

5. No nation represented in the Assembly shall acquire exclusive commercial rights with any nation outside of this union, and there shall be no transfer of political control over territory included in the union without the sanction of the Assembly.

6. Each nation shall treat all other nations on equal terms in matters of commerce, whether they be or be not represented in the General Assembly of the Nations; except that any nation can impose duties on the goods of any other nation equivalent to such other nation's duties on its goods.

7. While remaining in the Assembly, each nation shall have the right to arm itself and use its forces according to its own judgment, save as it may have agreed to resort to arbitration. But the armed forces of all the nations represented in the Assembly shall be at the service of the Assembly for the enforcement of decrees rendered by the International Court at The Hague according to recognized principles of law and under the provisions of treaties of arbitration.

8. The members of the Executive Council of the Interparliamentary Union when designated by the respective parliaments of the nations comprised in this union shall be an International House of Representatives, and it shall sit for at least three months during each period of five years.

9. Any general principles accepted by both this International House of Representatives and by the Assembly shall become international law, unless vetoed within three years by one-fourth of the nations' parliaments represented in this union.

10. Any nation may withdraw from the union at its pleasure

The Nitrogen Problem

BY JAMES MacKAYE

[The author of "The Economy of Happiness" is a practical chemist as well as a sociologist, and accordingly he considers the question of our future supply of available nitrogen, on which the existence and progress of the human race depends, from the double viewpoint, the method of solving the problem and the possible results of its solution.—EDITOR.]

THE body of man, exclusive of the bones, is composed almost entirely of four elements: carbon, hydrogen, oxygen and nitrogen. Like other animals, man is unable to utilize the simple compounds of these elements found in the earth's atmosphere and soil in building the tissues of his body. They must be elaborated into the form either of fats, carbohydrates or proteids before the digestive processes can act upon them. The conversion of the inorganic compounds of these elements into organic compounds is a function confined to the vegetable kingdom, and hence man is dependent upon plants for the maintenance of his life.

Plants obtain the carbon, hydrogen and oxygen which they require from the carbonic dioxide found everywhere in the atmosphere, and from the water found in the soil of all countries which are not desert. These materials are supplied in inexhaustible quantities to the vegetable kingdom by the normal processes of nature. But with nitrogen the case is very different. It is true that the earth's atmosphere consists largely of nitrogen, but it is free or uncombined nitrogen, and as plants can only absorb fixed or combined nitrogen, it is not directly available for their growth. The only nitrogen available for plant growth is the minute quantity found in a combined condition in the soil, and when this is exhausted plants can no longer grow. As man is dependent upon nitrogenous vegetable tissue to maintain his life, and as the nitrogen contained in the soil is becoming exhausted thru the withdrawal of the crops used to feed him, or to feed the animals upon which he in turn feeds, it is clear that the problem of returning nitrogen in an absorbable form to the soil from which it has been taken is one of momentous import to the future of mankind.

The principal nitrogen-containing plant utilized by the people of Europe and America is wheat, consumed largely in the form of bread. Other peoples consume corn, rice, millet or other grains as staples, and much of the nitrogen required by the human body is obtained from animals which subsist upon grass. But thru all of these channels vast quantities of nitrogen are constantly being removed from the soil, of which but a fraction is returned in the form of fertilizers. M. Grandeau, a French authority, has estimated that the crops harvested in France remove annually about 600,000 tons of nitrogen from the soil, of which only 358,200 tons, at a maximum—and probably a good deal less—is returned in fertilizers, representing a minimum deficit of 241,800 tons of nitrogen per annum. France is one of the most intensively cultivated countries in the world; and the corresponding deficit in most other countries is therefore much greater. In the United States, from 1901 to 1905, the average wheat crop was 660,000,000 bushels, representing a depletion of the soil approximating 1,237,000 tons of fixed nitrogen per annum. As wheat is not consumed by farm animals none of this was restored to the land in the form of stable manure.

Sir William Crookes, in his presidential address to the British Association in 1898, discussed the nitrogen problem in a restricted form as the wheat problem, and showed that unless science could solve it, the starvation of the bulk of the human race was predictable within a few generations. Referring to the increase in the consumption of wheat, Crookes says:

"In 1871 the bread eaters of the world numbered 371,000,000. In 1881 the numbers rose to 416,000,000, in 1891 to 472,000,000, and at the present time (1898) they number 516,000,000. The augmentation of the world's bread-eating population in a geometrical ratio is evidenced by the fact that the yearly aggregates grow progressively larger. In the early seventies they rose 4,300,000 per annum, while in the eighties they increased by more than 6,000,000 per anum, necessitating annual additions to the bread supply nearly one-half greater than sufficed twenty-five years ago."

After considering seriatim the possibilities of adding to the wheat-bearing areas in all the wheat raising countries of the world, Crookes concludes that:

"Should all the wheat growing countries add to their area to the utmost capacity on the most careful calculation, the yield would give us only an addition of some 100,000,000 acres, supplying at the average world yield of 12.7 bushels to the acre, 1,270,000,000 bushels, just enough to supply the increase of population among bread-eaters till the year 1931."

He then makes the following suggestive inquiry:

"When provision shall have been made, if possible, to feed 230,000,000 units, likely to be added to the bread-eating population by 1931—by the complete occupancy of the arable areas of the temperate zone now partially occupied—where can be grown the additional 330,000,000 bushels of wheat required ten years later by a hungry world?"

This suggests the supreme significance of the nitrogen problem whose answer science is at present seeking. The population of the world is rapidly increasing. Within a generation or two it is probable that the arable areas of the world will be practically all under cultivation. The crops withdrawn from these areas to feed the vastly increased population will be exhausting the fixed nitrogen from the soil at the rate of hundreds of millions of tons annually. How is this nitrogen to be replaced and the land rendered capable of growing sufficient nitrogenous food for the generations which are to follow? This is the nitrogen problem.

There is but one solution of it. A cheap source of fixed nitrogen must be discovered, in quantity sufficient not only to replace the nitrogen withdrawn by cropping, but to increase the fertility of the soil, so that more nitrogenous food to the acre can be grown than is possible today.

At the present time the attempts being made to replenish the rapidly exhausting soils of the agricultural nations of the world is a very feeble one. The principal fertilizer in present use is barnyard manure, but as the nitrogen contained in it has first to be withdrawn from the soil, it is clear that in its use we are simply returning to the soil a portion of the nitrogen already taken from it. The same observation applies to fertilizers made from slaughter-house waste. In addition to nitrogenous fertilizers of this class a little sulfate of ammonia is supplied as a by-product in the manufacture of gas, and a little guano is obtained from the coasts of South America, but the supply is about exhausted, and it is at present as small a factor in the problem as sulfate of ammonia. The most considerable factor is the sodium nitrate, or "Chili saltpeter," obtained from the rainless coast of Chili. About 1,500,000 tons are exported every year to all parts of the world. This amount contains some 238,000 tons of fixed nitrogen, or less than one-fifth the quantity required to replace the nitrogen withdrawn in one year from the wheat lands of the United States alone. Besides, even at the present slow rate of exportation the Chili saltpeter mines will probably be exhausted by 1940.

In this exigency chemists have turned their attention to the one great source of nitrogen which can afford relief—the atmosphere. Altho about 80 per cent. of the atmosphere consists of nitrogen it is very difficult to make it available for fertilizing purposes because of its great chemical inertness, its reluctance to enter into combination with other elements. Nevertheless, means for making it combine are known, and the problem which the chemist must solve is to employ these means in a manner which will be commercially practical on a large scale. The problem has been attacked from three sides.

The first method of fixing atmospheric nitrogen is thru the aid of micro-organisms known as nitrifying bacteria, which occur in the soil. These bacteria act directly upon the nitrogen in the air which permeates the soil and bring it into combinations which plants are able to utilize. There are two classes of the bacteria. The first may live in almost any soil supplied with the requisite organic matter. They may be cultivated in suitable cultures and the soil inoculated with them, and very satisfactory results have been obtained in some cases from this practice; but the results are very divergent and uncertain, so that thus far nitrogen fixation by this process has not proved a success in practice. The second class of nitrifying bacteria live only in tubercles on the roots of leguminous plants like peas, beans, clover, etc., and it is because they so frequently are provided with such tubercles that plants belonging to this order are able to renew exhausted soils. Their revivifying power has long been known to farmers, but the explanation of the phenomenon is rather a recent discovery. The use of tubercle-bearing leguminosæ to replenish the nitrogen lost from the soil has been much more successful than the use of cultures of the first class of bacteria, and the practice of growing plants belonging to that order and coincidently inoculating the soil with cultures of tubercle-forming bacteria is one of considerable promise as a contribution to the solution of the nitrogen problem.

The second method of fixing atmospheric nitrogen is thru the aid of calcium carbide. Messrs. Frank and Caro, of Berlin, have discovered that the carbides of the alkaline earth metals absorb nitrogen at a low red heat, forming cyanamides. The cyanamide of calcium formed in this way, when placed in the damp soil, slowly decomposes with the production of ammonia salts, which are available as sources of plant nutrition. Calcium cyanamide, made in this manner, is now on the market as a fertilizer under the name of lime nitrogen. With the present high cost of manufacture of calcium carbide, however, it is not very promising as a contribution to the solution of the nitrogen problem, but it is still in an early stage of development, and future improvements may alter its status. The third, and thus far the most promising, method of fixing atmospheric nitrogen is thru its oxidation by means of the electric flame or arc. It has long been known that if electric discharges are passed thru a mixture of nitrogen and oxygen, the two elements will unite, forming oxides of nitrogen which on treatment with water generate nitrous and nitric acids. These well-known reactions are the basis of the modern electric method of solving the nitrogen problem. Air, which consists of about one part oxygen to four parts nitrogen, is passed thru a powerful electric arc, a partial union of the gases is thereby brought about, and the resulting product is led thru water, which washes the oxides of nitrogen from the large quantity of air with which they are mixed. The most serious difficulty encountered in rendering the process a commercial success is to make enough oxide of nitrogen to pay for the great amount of electrical energy required to maintain the arc.

A large number of experimenters have attacked this problem, and many are still at work on it, but thus far the best results have been obtained by the Birkeland-Eyde process at Notodden in Norway. The process is carried on within a narrow furnace made of firebrick. An alternating current at a potential of 5,000 volts is caused to arc between two copper electrodes, which are kept from melting by a stream of water circulating thru them. The arc space is placed between the poles of a powerful electromagnet and in the center of its field. As soon as the arc is formed it is acted upon by the magnetic lines of force in the well-known manner of all electric currents, and moves with great rapidity away from the center of the field where the magnetic force is strongest toward the periphery, where it is weakest. There it breaks, and a new arc is formed which repeats the process. As the current is an alternating one, alternately reversing its direction, half the arcs recede from the center of the field in one direction and half in the other. The constantly forming and breaking arcs thus produced, follow one another so rapidly that they assume the form of a great disk of

electric flame, presenting a reactive surface of vastly greater extent than an ordinary arc of the same power. Thru this disk is driven a rapid current of air, which emerges laden with about 1 per cent. of nitric oxide, which, on cooling, unites with more oxygen to form nitric peroxide. The product thus obtained, after being separated from the main body of air and converted into nitric acid by suitable treatment with water, is made to unite with lime, the final product being calcium nitrate. This is used as a fertilizer, and thus the nitrogen of the air is made available for the nutrition of plants, and thru them for the nutrition of man.

Owing principally to the peculiar form of the arc used, the process described is the most efficient yet brought to the attention of the public. A new factory to consume about 27,000 horse power is in process of erection at Notodden, and, according to the prospectus of the company which owns it, one ton of fixed nitrogen can be produced for about $150.

As one bushel of wheat, grown under proper conditions, abstracts approximately 3.75 pounds of fixed nitrogen from the soil, it will, by the process described, cost about twenty-eight cents to replace this amount, exclusive of the cost of distribution. At the present time fixed nitrogen in the form of Chile saltpeter costs about $275 per ton, or fifty-one cents for the nitrogen equivalent of a bushel of wheat. Hence, it appears that the air may already be converted into a cheaper fertilizer than can be dug from the saltpeter beds of Chile. Of course, all processes for the solution of the nitrogen problem are still in the experimental stage, but the present outlook is that great improvements will soon be made, and that science is on the eve of at least one, and probably of several, solutions, the most effective of which will ultimately be adopted. Thus in the future there is little doubt that the exhausted soils of the earth will be replenished from the inexhaustible reservoirs of the atmosphere, and that the ingenuity of man will supply the deficiencies of nature.

But there is a far more vital question involved in the nitrogen problem than its solution. Supposing it completely solved—what then? The task remains of employing the solution to further some useful purpose. It seems generally to be assumed in our day that any great advance in the productive arts is bound to accrue to the benefit of humanity; but there can be no greater delusion. Such advances have in many cases proved greater curses than blessings to mankind, and in countries where they result in increasing, not *the rate of consumption per capita,* but merely *the number* of the population, it is normally so. Indeed, all improvements in the art of agriculture will in the end prove curses unless means are adopted to make them subserve the useful purposes which they are adapted to subserve. Science today is employed in immensely advancing the economy of production, but it is not employed in advancing the economy of consumption. Men use their ingenuity to improve the means of producing things, but they do not use it to improve the means of putting such things to useful purposes. It is to the arts of consumption that science should now direct its energies, and when thru her agency those arts are made to improve as rapidly as the arts of production are now improving, the great problem of human happiness will be solved. That problem is a far greater one than the nitrogen problem, or any other which may be proposed, and a *laissez faire* policy of neglect can no more solve it than it can solve the nitrogen problem. Science by providing man with an abundance of fixed nitrogen will put it within his power to supply every member of society with ample means of subsistence. She should next provide the means of insuring that the increased supply thus to be made available is made to serve its purpose—is actually furnished the members of society. It will do no good to utilize food which might be consumed in supporting happy men and women, in supporting unhappy ones, even tho the numbers of the latter be larger.

Now unless science can devise some way of distributing the products of the earth with some fair degree of equality, and of checking an inordinate birthrate, then the solution of the nitrogen problem will in the end make the community more miserable, instead of more happy. For

poverty is a matter, not of total, but of per capita wealth, and to prevent it means must be provided, not only for securing equality of distribution, but for nullifying the law of Malthus, that is, for offsetting the tendency of the population finally to increase faster than the means of subsistence. If this last requisite is not met, fulfillment of some, or of all, other requirements of prosperity will in the end be worse than futile. To improve the arts, to increase the total wealth, to distribute it equally, or to simplify the tastes of men, will avail nothing; in fact, will prove positively harmful, so long as the per capita wealth continues to decline thru inordinate increase of the population. This is as true for a country of 3,000,000 square miles as it is for a farm of 300 acres, and unless we wish to follow the example of such overpopulated countries as India, China and Japan, and force our posterity into the famine business, we must begin the study of this most momentous of questions at once, for efficient production does not imply efficient consumption. India, with its starving myriads, exports millions of bushels of wheat every year.

In fact, if Science, while solving the nitrogen problem and causing two blades of wheat to grow where only one would grow before, neglects to solve the more important problem of how such added wealth may be efficiently consumed, she will only succeed in rendering more insoluble the problem of human happiness, and in causing two unhappy human beings to live where only one would have lived before.

BOSTON, MASS.

The Increase of Crime in the United States

BY JAMES EDGAR BROWN

I RECENTLY had opportunity to make a personal investigation of the criminology of five European countries—Italy, Switzerland, Belgium, France and Germany—and compare my observations with the records and conditions in the United States. The result may disturb our national self-complacency, but it is interesting and should be instructive. Take the item of homicide, for example.

Josiah Strong's "Social Progress" for 1906 gives the following table of homicides and the annual average:

	Tried.	Convicted.
Italy	3,606	2,805
Austria	689	499
France	847	580
Belgium	132	101
England	318	151
Ireland	129	54
Scotland	66	21
Spain	1,584	1,085
Hungary	...	625
Holland	35	28
Germany	567	476

How was it in the United States? The average number of murders in the United States annually during the past twenty years, from 1885 to 1904, was 6,597. In 1896 the murders reached high-water mark, 10,662, and in 1895 there were 10,500. In Germany the convictions equaled 95 per cent. and a fraction; in the United States, 1.3 per cent.

In this connection, the nationalities of the homicides in the United States will be of interest. August Drahm gives the following table:

Native white	42.94 per cent.
Foreign born	16.50 per cent.
Negroes	37.12 per cent.
Chinese and Japs	1.28 per cent.
Civilized Indians	1.21 per cent.

The most reliable statistics obtainable show that the number of homicides in the following countries are:

United States	129 to each million inhabitants.
Germany	3 " " " "
Canada	5 " " " "

There must be some deep-seated cause for this terrible discrepancy. If we read history aright, no other nation has ever attempted, on so large a scale, to assimilate into one composite whole so many

antithetical elements, so many racial characteristics, such a heterogeneous mass of national diversities as America is attempting to do today.

Were the lions, panthers and man-eating tigers of Lincoln Park released and permitted to roam at will, scarcely an eye in Chicago would close in slumber tonight. Yet this same city is now doubtless infested with many hundreds of desperate criminals, infinitely more crafty and dangerous to human life. In India, when a man-eating tiger descends on a village, kills some victim and gets a taste of human blood, a tiger hunt at once is organized. With the aid of courageous and trained riflemen they beat the jungle and hunt stripes to his death. Here we make a perfunctory search for the human hyena, and, not finding him, go placidly on about our various affairs, each one hoping he will not be the next victim.

In the poorer quarters of our great cities may be found huddled together the Italian bandit and the bloodthirsty Spaniard, the bad man from Sicily, the Hungarian, the Croatian and the Pole, the Chinaman and the negro, the cockney Englishman, the Russian and the Jew, with all the centuries of hereditary hatred back of them. They continually cross each others' path. It is no wonder that altercations occur and blood is shed. The farmer does not turn a vicious short-horned bull into the pasture with his horses; nor does he permit small chickens to mingle with his hogs.

We read with horror of the outrages in Armenia. The same and greater outrages are perpetrated in the United States every year. There are enough murders committed in the United States each year to depopulate a small city, and comparatively few of the murderers are ever punished. Many of the criminals are never discovered, or if caught our police system is so inadequate that they cannot be convicted. What attempt is made to keep track of the whereabouts and conduct of the convicts who are released from our prisons? They are turned loose without surveillance and with all their criminal instincts to mingle with and contaminate the population. They become free American citizens, free to vote, rob, or cut a throat. In many respects our attempts to administer justice are a farce and a failure.

A comparison of crime in the German Empire and the United States, and especially the cities of Berlin and Chicago, is of considerable interest to a student of sociology and criminology. It is very significant when we consider that civilization may be defined as the act of reclaiming from a savage state, implying the security of life, limb and property. The German Empire has sixty millions of people, and the United States eighty millions. The city of Berlin proper, exclusive of its suburbs, has two millions and Chicago, with a somewhat larger area, claims an equal number.

In the United States we have talking fests and exhaust much hot air from our lungs. We are egotistical and conceited and inexperienced, puffed up with pride over our country, when in reality the most horrible and intolerable conditions prevail. The Germans do not boast; they accomplish results.

The greatness of a country depends infinitely more upon the character of its people than upon their numbers. Immigration from other countries into the United States now exceeds one million annually. Our laws exclude paupers, persons likely to become public charges, felons, anarchists, etc. In spite of these laws, during the past year we admitted many thousand persons into the United States who had less than $50 each. In the absence of a system of registration and a rigid personal investigation, how do we know whether an immigrant is a felon or an anarchist? If we actually exclude felons and anarchists how does it happen that we have so many foreign-born felons and anarchists? Are they pious, peaceful, law-abiding citizens when they land, and then suddenly become metamorphosed into felons and anarchists on coming in contact with our institutions? If so, it might be well to look to our institutions.

We boast of our intelligence, schools and general dissemination of knowledge, and yet we have in the United States about two and one-half millions of people who can neither read nor write. The average annual fire loss in Chicago is about four million dollars. We have a good fire department, but our building

laws are a survival of the dark ages and are not even enforced. We claim to be a rich and prosperous city and yet we cannot afford to employ enough policemen to keep thieves and burglars out of our houses and thugs and robbers from knocking us on the head as we walk along our own streets. Berlin has 5,303 patrolmen, and is safe. Chicago, with the same population and a larger area, has 2,688 patrolmen, and is unsafe.

By comparing Germany with the United States we find that in the year 1903 there were three hundred and twenty-one (321) cases of homicide in Germany, whereas in the United States during the same year there were 8,976. In Germany they convicted about 95 per cent. of prisoners charged with homicide; in the United States, less than 2 per cent. In Germany graft and boodling are practically unknown, whereas in the United States even many of our most prominent citizens are intimately acquainted with both.

We are liable to become complacent and accept with resignation existing conditions unless we get away from home occasionally and compare ourselves with others. The bald, bare, horrible fact is that the conditions existing in Chicago today are the most criminal and damnable of any large city on the face of the earth.

During a recent visit to Berlin I called upon Dr. Lindenau, the assessor of criminal statistics, or Regierungassessor, for the city of Berlin, to whose kindness I am indebted for much of the information obtained concerning the excellent government of that great German city. In addition I obtained the last volume of the criminal statistics for the German Empire and also of the city of Berlin. From these combined sources I obtained the statistics here given.

The wrong-doer in Berlin, if his offense be of a minor character, is first given a warning and opportunity for reformation. For instance, in the year 1903 the arrests for drunkenness in the city of Berlin were 803, and in the year 1904, 740; but the number of warnings concerning drunkenness in the latter year were 3,967, and the number of citizens who were ordered to "move on" and told to "clear out" was 510 in 1904.

In Berlin there are no saloons in the American sense, but wine and beer are sold at restaurants and eating houses. There are no secret drinking places, or dens behind closed bars. The German people are not addicted to alcoholic drinks, or spirits, and whisky is sold, as a rule, only at places patronized by Americans and Englishmen. These places are usually designated American bars.

I spoke of our "police system." The word is a misnomer. We have no police system in the United States. Germany has such a system. When a number of Slovaks from Russian Poland, the most criminal class of Europe, are about to start for America to become citizens of the United States, the German officials know all about it. So dangerous do they consider these people that they send a squad of police to the frontier to meet them. The police take the same train and do not let them out of their sight until they finally embark at Hamburg. Not one of them is permitted to set foot on German soil.

The German police have a wonderfully intimate knowledge of the movements of the people. In Berlin, and elsewhere in the Empire, you are expected to notify the police captain upon leaving town, and again on returning. To illustrate, my wife's people had a residence in Berlin and another in Rome. She had planned to go into Italy for a month, and promptly reported her intention to her friend, the police captain. When she returned she as promptly looked him up and said, "Well, I am back again."

"Where did you come from yesterday?" he asked. She named the city.

"Did you come direct to Berlin?"

She replied that she did. The captain's eyes twinkled as he shook one finger at her and said with mock severity:

"Yesterday noon you registered at a hotel in Frankfort."

"You are right, we did," she answered; "but how did you know it? We stopped there two hours for dinner and rest."

The explanation was simple. The chiefs of police in the various German cities have a habit of exchanging reports each day, particular attention being given to hotel arrivals.

The European countries not only prevent crime; they get rid of their crim-

inals. They move them across the border into the next country, from which they are soon moved to the next, and finally land in America. It is even intimated that the authorities sometimes pay the fare of undesirable persons to New York, and even lend them $100 to enable them to pass the immigration officers. The money is collected agair .t the front door of the custom house. They have been perfecting their system for a thousand years, in comparison with which the United States is in its infancy.

In Belgium the career of every citizen is a matter of record, as easily ascertainable as is the title to a piece of property in this country. Every man must carry this record with him or be able to produce it when required. When a child is born he is christened and then taken to the recorder, where the date of birth, sex, name, names and nationality of its parents, etc., are recorded. The parents are given for the child a little book, similar to those used in savings banks, which contains the record. When the child starts for school the fact must be recorded in the little book. When he gets into difficulty, when he graduates, when he enters the army, is mustered out, these events and others must properly be set forth in the little book. In case the book is lost there is a penalty attached to failure to procure a duplicate. When a man asks for work the employer asks for his record, and governs himself accordingly. With one exception each entry in the book must be made by the recorder. When a man is discharged for cause the fact and the cause must be recorded by the employer, and the law imposes a penalty if he records falsely.

Our innocence in enforcing that clause of our immigration laws relative to admitting paupers, persons liable to become public charges, felons and anarchists into America is pitiable in the extreme. For instance, our customs officials ask the immigrant himself, or some of his friends, whether he is a pauper, how much money he has, and whether he is a felon or anarchist. Of course the answer is always in the negative. Then when he presents himself in Chicago, or elsewhere, for naturalization, just before an election, the innocent judge asks him if he is an anarchist or a criminal, and whether he is willing to support the Constitution of the United States. Some of his friends, who have been coached by the politicians of his ward, state that they have known him the requisite time and that he is a good citizen, and, presto, another voter is created.

The enforcement of this clause in the immigration law would be so simple and easy one wonders why it is not accomplished. Owing to our lack of registration and the absence of information concerning the individual records, not only of foreigners, but of our own citizens, it is practically impossible to get the requisite data when a foreigner attempts to land after crossing the ocean. But all, or nearly all, European countries having adopted a strict and rigid system of registration, and knowing the history and career of every citizen, how easy it would be to establish an honest American immigration agent at the port of embarkation, at Genoa or Naples in Italy, Cherbourg in France, Southampton or Liverpool in England, Hamburg or Bremen in Germany, and require an official guarantee concerning the character and reputation of the prospective emigrant from the country to which he belongs. The immigration laws should be revised with the least possible delay in order to check the horde of undesirable immigrants Europe is loading upon us. We already have enough criminals to occupy our undivided attention for a decade to come. We permit our native criminals, as well as those foreign born, to marry and increase the criminal population; then wonder at the increase in crime and tax ourselves to suppress it. Asexualization of known and convicted criminals and rigid marriage laws would be a great aid in purifying the present contaminated population.

The law-abiding, order-loving, property-owning citizens everywhere should demand an adequate police force; the elimination of all useless and vicious elements in the force; a complete system of registration, so that we shall have the record of every citizen and every visitor within our gates. The police captain of every precinct should be held responsible for the conduct of the people under his charge, and the territory should be subdivided until every patrolman could know by sight every individual within his jurisdiction.

CHICAGO, ILL.

The Ocean

BY THE REV. FRANK CRANE

ONE goes across the ocean to see cities, cathedrals, parades, galleries and mountains. But the thing that has impressed me most of all has been the ocean itself. All other memories of my vacation are submerged by the sea. It is the greatest homogeneous thing, as far as we know, that the Creator has ever made.

The ocean remains with me in three effects: as a series of pictures, as a feeling and as a class of ideas.

Paintings of the ocean are to me the most disappointing of all artist work, because light and motion are its most salient qualities, and light and motion are precisely the elements that cannot be captured by the canvas. The great water is really a vast mirror, or rather a multitude of rapidly, liquidly shifting mirrors, and holds all the brightness of the sky in solution.

Few persons appreciate the color scheme of the ocean. It is rarely the uniform, conventional blue. It gives back all the tints of the sky; but as it is always a more or less broken surface, it shows these colors shaded into one another, without the sharp cloud lines. The blending is so gradual that one misses the separate hues, unless he gives close attention. Cloud shadows are rarely mere shades of darkness upon the water, but are tinged with marvelously soft tones of blush and violet and purple and mauve.

It is an interesting fact that at sunset the sky presents the colors of the rainbow in their order, beginning usually with the reds in the west and extending to the violet east. One evening I observed a curious phenomenon. The sun, having set behind a cloud, threw a full red upon another cloud about twenty degrees high; from this point the colors ran around the whole circle of sky and sea, ending with a violet haze directly in the west and below the red starting point; and the line of the western horizon being obscured slightly by mist, we seemed to be inside of a great rainbowed ball, and it was as if our ship were a dark spot creeping thru a colored crystal.

One morning, the sun being well up in a cloudless sky, the whole ocean in his direction was as a quivering sheet of unbearable brilliancy; and I understood where the seer got his simile, "a sea of glass mingled with fire."

And that night when the full moon hung in about the same place the sun had been, I looked out of my porthole and saw, by the familiar ocular delusion caused by the beholder being upon a moving vehicle, a million waves circling about the moon's seat, each of them tipped with light, as if they were innumerable bright beings carrying firefly lamps; and I could think of nothing else then but of a certain dancing bass motif in one of Handel's choruses: "Let all the a-a-a-a-a-a-a-a-a-angels of God worship Him!" There were the endless battalions of shining ones, wheeling in praise around the throne.

In storm the sea becomes a huge field of moving, unhappy mountains, rising and subsiding with confusion, yet with a certain rhythm. It seems a misnomer to say waves. Really they are hills and valleys, acres wide. We seem to be in

a Switzerland of waters, with swift forming peaks, which as swiftly sink to become broad valleys.

Only from the shore are waves seen to come on in rows. In midsea they are infinitely complex.

The sounds of the ocean are like nothing else. Its voice is as distinctly its own as the lowing of a cow differs from the neighing of a horse. We say the sea roars, bellows, shrieks or whispers, but these are terms borrowed from the animals. We have no distinct word for the ocean-voice; yet often our great poets have tried to express the idea; as Homer, with his "*polyphloisboio bioio*," and Saint John, where he describes the sound of the multitudes shouting in heaven as "the voice of many waters." What both were trying to express was this sea-voice. Perhaps it is just as well, however, for finding a name for a thing seems to be the first step toward losing our sense of wonder at it. Electricity, force, life and love are simply labels pasted on bottles whose contents are unknown. Fools think because they can read the label they know what is in the bottle. I have sometimes thought that the very name "God" is productive of irreligion.

To approximate in a word the feeling produced by the ocean, the only word I can think of is "infinite." I never feel that word so deeply as when I am out of sight of land. As day after day I sit upon the deck and watch each morning repeat the boundlessness of yesterday; as I feel apparently fixt in the midst of an airy, watery void, and yet know that I am being carried forward with the speed of an express train; and as the vagueness of it all infiltrates into my soul, I seem to feel eternity closing in upon me, and the Unknowable, which I have tried to grasp in philosophy, so close that I can feel its breath.

So individual are the impressions made by the sea that it seems to have an actual personality, with a soul and a soul's moods. This must be the reason that most people either love or hate it; few are indifferent. Some are drawn to it with an irresistible lure; away from it they suffer as from love sickness or from home sickness. Others never cease to regard the ocean trip with a feeling of inexpugnable dread.

Being addicted to the preaching habit, I was tormented by the recurring memory of St. John's phrase, which he uses in his description of the millennial new heaven and new earth, "And there was no more sea." One day when the spectacle before us was one of most majestic beauty and the sun was slipping, a blood-red disk, into the water, I confessed my puzzle to a Russian gentleman who stood beside me. Indicating the scene with a sweep of the hand, I asked him what he thought the prophet meant by saying there would be no more sea in the golden days. "Will not the world lose when this is gone?" I added.

"Ah!" he replied, with a suggestion of bitterness in his voice, "but you must remember that to John the sea meant exile."

If we take the sea merely as the symbol for those barriers that have always divided men, then, to be sure, it is being done away with by civilization. The most impressive fact of our day, perhaps, is the disappearance of the stubborn physical hindrances to universal brotherhood.

The modern development of transportation has been the death blow to provincialism, not only in manners, but in the spiritual realms of art, science and religion.

Because of this, there will never appear a new language on earth. And indeed, somewhere lagging behind unity of commercial interests and rapid transit, will come the one common human speech. No doubt the earth will some time be like heaven, in one respect at least: "*Multæ terricolis linguæ, cœlestibus una.*"

The ocean liners are being made larger and larger. Think of ships as long as three New York City squares, as high as the Capitol building at Washington, with leviathan nostrils — smokestacks wide enough to allow passage thru for two passenger locomotives abreast! And travel upon these ships, say statistics, is safer than travel on land. These are the enormous shuttles that are weaving the millennium. The physical basis of the golden age is steam. National feeling is

slowly melting into the passion for humanity. In the House-in-the-woods at The Hague, where the world is taking its first steps in world self-consciousness, there might be appropriately inscribed somewhere, "And there was no more sea." When the Japanese gentleman discarded his silk gown and put on a frock coat and tall hat, it meant more than aping a style; it meant that for Japan the sea was annihilated.

In former ages the ocean was the haunt of the buccaneer; it stood for far isles, and pirates, and strange, outlandish peoples. Because the turbulent, lawless element of the race always found refuge there, it was the menace to the progress of all orderly governments. Nowadays the land is policed by the sea. Future conflicts for supremacy will probably be decided by naval power. All this makes the Republic of Mankind possible, which indeed was physically impossible so long as the arm of law was only a slow-moving army, "traveling upon its belly," and every sporadic attempt at civilization was open to the inroads of savagery from the unknown sea.

Another fact concerning the ocean is pregnant with dreams. A scientist once said to me that there is more life in the water than there is in the air or on the land. This blue curtain, which we call the surface of the sea, separates, then, two vast orders of life. It is a shining partition between the water-world and the air-world. And how remote from us is that teeming population of the water, from the whale to the minnow, living, loving, fighting, dying! They die in our element and we in theirs. No one can pass that veil and live. The flying-fish can dart into the air, and the diver may plunge into the water, but only for a moment; they must turn again home at once or perish.

And so it has seemed to me a not unlikely simple proportion, that the world where live the blessed dead is to our world what we are to the fish-world. I would not strain the comparison; but to how many among us do the spiritual impulses, laws and verities remain curtained and concealed as if ours were indeed an ichthyic life! Perhaps the upper inhabitants do dive into our atmosphere for a moment and create those strange psychical disturbances that have been recorded; and perhaps some mortal men, in trance or otherwise, have flung themselves as a flying-fish into that higher ether.

There is still another aspect in which the sea touches our thought. In "The Fighting Chance" Mr. Chambers makes his hero compare the inherited appetite for alcohol within him to the sea:

> "I hate the sea. A man who plays with it must be on his guard every second. To spend a lifetime on it is ridiculous—a whole life of intelligent effort against perpetual, brutal, inanimate resistance—one endless, uninterrupted fight—a ceaseless human maneuver against senseless menace."

Something of this every man has felt, to a greater or less degree; and the more forceful the nature, the fiercer the wrestling appears to be. I am astounded, when I read the lives of strong men, at the long battles with elemental physical storm winds and brute waves they had to encounter. Their words of confession sound like baffled sailors crying out in a rough night. And this, whether they be like Mirabeau and Wagner and Rousseau, or the type of Saul of Tarsus and Luther and Francis of Assisi. What a tremendous struggle for a genius to be decent!

Will this ocean enemy of unintelligent passion and appetite and brute force, that underlies humanity, ever be charted and sounded? Will safe and comfortable liners await the new born, to bear them over this waste of waves to their goal? Will the "ever wind-obeying sea" of heredity be some day conquered by a moral steam force, so that man can be carried as safely forward thru storm convulsion as thru summer calm? Why not? The child of the twentieth century already embarks upon a much more seaworthy craft of environment and institution than that which served for the child of the fourteenth century.

The last impression I here record is stated with genuine humility. It was the realization of my own greatness, not of myself egoistically, but of myself as one of the race of man. I remember one stormy night, coming up to the hurricane deck, rightly named on this occasion, for the wind was so fierce I could not stand against it without support.

Our great ship rose and sank as if it had been a bit of cork, among the uneasy mountains of water. It was a vicious head-wind, and yet the officer informed me that we were making our usual time. Then somehow Man rose in my estimation, and my little self rose with my kind. It was splendid to see him laying his "everlasting No" against the wild will of this nature's monster. Our ship seemed to ride the sea as one rides a thorobred, with joy in the power of his steed. My heart swelled with a strong draft of joyous courage. I smiled at some nameless fears within me, of which I am now and then not a little frightened, and I hugged a big mast, and let the wind tear against my face, and said to myself those fine lines of Henley:

"It matters not how strait the gate,
How charged with punishment the scroll;
I am the master of my fate,
I am the captain of my soul!"

WORCESTER, MASS.

A Musical Caliban

BY CARROLL BRENT CHILTON

[Now that that musical instrument generally known by the name of the Pianola, has been recognized by the lay and professional mind alike as a serious and permanent musical instrument, it may well be asked, "What is its rationale? and what is the service besides that of entertainment?" From all appearances, the instrument has come to stay. Something like eighty different makes are now before the public, and it seems to be probable that in a few years no piano will be made without the roll mechanism as an adjunct.—EDITOR.]

MUSIC is both a science and an art: The art of music consists of the employment of certain sensuous means called Rhythm, Melody, Harmony, Form and Color, to induce refined, elevated, beautiful or significant states of soul or feeling. Certainly no musical composition can be truly said to exist until at least the rhythm and notes are accurately given. Lacking these necessary factors, no amount of "touch" or taste, or esthetic comprehension will avail, since the very germs of the work are absent. How are we to become acquainted with musical compositions?

Every musician knows, that, taking all music together, symphonies, quartets, sonatas (for all instruments), overtures, symphonic poems, operas, oratorios and songs, not 2 per cent of all players are able to play the rhythm and notes, to go no farther, of 2 per cent of this world of compositions. Every musician knows also that seven-eighths of these works are never heard performed in public, and what is very much to the point, even tho they are occasionally given—single performances of larger works are, from the transitory nature of musical impression, all but valueless, in a pedagogical way. It follows that 98 per cent. of all music-lovers are shut out from 98 per cent. of all music all the time. What public performances there are, are mostly thrown away in missionary efforts to make the compositions known.

How a thing is done can hardly be made apparent to him who knows not *what* is being done. This fact has long been appreciated. Mr. Kneisel told the writer that the Denver Morning Musical Club hired a quartet to go from New York to give daily for two weeks the identical programs which were to be given later by the Kneisel organization.

How to disseminate music among the people at large has been the problem which educators here have had to face.

In the very naure of the case there seemed only one way open—repetition. "Repetition is the mother of studies," says a Jesuit maxim. The crying need of musical education hitherto has been of some means of *repeatedly* presenting to the ear the concrete subject-matter of music, viz.: sounding musical compositions.

Long ago, Ferdinand Hiller wrote:

"The fundamental evil in music is the necessity of reproduction of its artistic creations by performance. Were it as easy to learn to read music as words, the sonatas of Beethoven would have the popularity of the poems of Schiller."

The miracle which Hiller scarcely hoped for is now accomplished. By means of the piano player reading music is now as easy as reading words. The inventors of the new instruments, without knowing it, were creating an audible reading system for music—a primary solid base upon which the future development of music may henceforth rest. It remains to turn the new resources to account in an educational way.

Now that human ingenuity has devised a method for the sensitive and permanent registration and reproductions of musical creations, and at the same time a practical means for ear training, the noble art of music, which has so long been a thing understood only by the few, will grow in time to have as extended an audience of intelligent admirers as literature itself, and so become a part of the work of every college and school and one of the constituent factors of a liberal education.

The serious opinion of the most thoughtful musicians and educators of the world is that in this little instrument there lie the germs of a revolution in the means and in the standpoint of musical education; that in music rolls expressing accurate rhythm, pitch, and staccato and legato, the student is provided with a sort of "audible notation" of the fundamental nucleus of musical thought—the sounding effect of all that part of the music which the composer himself could express in print.

Given this basis, the student player may add expression according to his taste, skill or intelligence. Without this authentic basis, however secured, whether by hand or perforated roll, music cannot be said to exist at all, since no amount of skill or taste or enthusiasm will suffice to make music when these factors are missing.

"Music," says von Bülow, "should first be played accurately, then beautifully, then interestingly." Probably one player out of a thousand could play with technical accuracy as great as the reproducing instrument, and, *besides,* add a musical quality which no reproducing instrument could ever approach. But *the other nine hundred and ninety-nine,* with accurate music rolls, can obtain a better technical *and* musical effect *without labor* than they could ever produce by years devoted to the study of hand playing.

So it has turned out that the dreaded machine, so far from being a burden on the wings of music, was the very weight that enabled the kite to soar.

A clodhopper can see that if the outlines of musical compositions can be brought to bear upon the nerves and soul of human beings thru the miraculous channel of the ear, "steering straight for the cortical cells," we have attained the end of musical expression. We do not quarrel with the parchment on which a king's message is written.

The idea that music might be produced thru employing a device to do the brute labor of depressing piano keys seemed at first a shock to the sensibility of the musical exquisite, natural enough as a prejudice, which had to seek cover when confronted with the thing actually done.

It was seen that the pianoforte itself was a machine, the human eyeball another, and that there could be, after all, no necessary connection between music and the ten fingers of the human hand.

John Fiske used to state that as all science is an increment of the power of the eye, so is all human art the increment of the power of the hand. Said he:

"The wonderful printing press and the engine that moves it are the lineal descendants through countless stages of complication, of the simple levers of primitive man and the rude stylus wherewith he engraved strange hieroglyphics on the bark of trees. In *such ways, since the human phase of evolution began, has the direct action of muscle and sense been supplemented and superseded by the indirect work of the inquisitive and inventive mind.*"

As life grows more exacting and complex, the bodily organism has been obliged to evolve new organs and new capabilities. "The practical advantage is enormous of having all improvements external," says Drummond ("The Ascent of Man"), "of having insensate organs made of iron and steel rather than wasting muscle and palpitating nerve."

Lacking hitherto any means of becom-

ing familiar with musical masterworks by saturation is it any wonder to find the American musical devotees swimming around in a viscuous sea of vague and superficial impressions of their dearly beloved mistress upon whom they have been hitherto permitted to gaze thru lattice bars of the lovers' balcony ten times a year—many, most, indeed—not ten?

In Berlin you go to an evening party composed of men of affairs, business men and professional men—a quartet of Haydn is played. It would be remarkable if there were a single man present who was not familiar with it. In New York it would be remarkable if there turned out to be one who knew it.

I have heard a professor of psychology in a leading Normal school, say that he had given up going to concerts of the Boston Symphony Orchestra, as he could not stand the mental strain of trying to recall which symphony he had heard before. Yet he had been a lifelong devotee of music and was an intelligent amateur.

It is the old curse of flimsy impressionism, which, as applied to musical listening, is peculiarly fatal in its effects. Without other means of familiarity, the plain man's key to music, a man might go to concerts all his life without ever learning one composition thoroly well. "Beauty is like a temple, whose external adornment alone can be seen by the uninitiated."

In the Athens of musical America, 2,569 devotees go forty times a year, and have for years, to hear one of the finest orchestras in the world. Yet when I inquired of competent observers how many of these persons could probably give at random a witness of their light, respecting a given work in the standard repetory of that orchestra, say the themes of the Finale of Schubert's C Major Symphony, or the Scherzo of the Seventh Symphony, a leading manager said, "fifty." A leading critic said " a hundred, and they would all be professional musicians"! What of the others? "They enjoy only the sensuous bath," said my informant; the animal stimulation, as it were, without the spiritual message of the composer. So it is everywhere in this country where Rubinstein's estimate is probably right, viz., that 18 per cent. of the English (speaking people) know and understand music; 30 per cent. of the French and 60 per cent. of the German.

Not to know these works referred to is to be as ignorant as a person would be who should profess lifelong devotion to literature and could not tell what "Macbeth" or "In Memoriam" is about, or even the very names of the characters of the leading theme.

Everywhere we find the limitation of single performances. In Boston (tho to a lesser extent than in New York perhaps), the fetich of music creates musical stilt-walking as a very grace of life abounding. I saw at the Harvard Musical Union a company of representative Bostonians listening for two hours to a delightful program by the Willy Hess quartet — quartets of Beethoven and Schubert, I remember, were played and wonderfully histrionized. The audience had "limped hither in pure love," and was the most superior looking body of men I chance to have seen. Nothing more delightful could be contrived, yet it may be doubted if ten persons present that evening could now give a connected idea of Schubert's D minor quartet or the Beethoven op. 18, or even their principal themes. For this state of things, as a substitute for the "Haus Musik" of Germany, some persons see in the piano player the only efficient remedy; and the little Caliban of art—giving us vivid impressions of masterworks, preparing us for hearing with the mind and soul and recalling our vanishing musical ideas—is rapidly making a world of intelligent listeners.

I am accustomed to say, in championing the use of the piano-player in college, school, club and home, that it is a practical device, which plays a *given composition at least as well as any person who does not play better than it.*

A practical expert in musical affairs in Worcester, Mass., Mr. Charles I. Rice, Supervisor of Music in the Public Schools, has stated that:

"The so-called mechanical piano player is destined to do more toward popularizing good music the country over than the three great symphony orchestras of Chicago, New York and Boston combined.

"Their influence is necessarily limited, while with an insignificant outlay I can by means of a piano player in each of my high schools place 2,000 pupils weekly in intimate relations with some distinctive masterpiece of music.

"An intimate acquaintance with a limited number of compositions which illustrate individual styles and different treatments of subject matter, is preferable to an aimless and indiscriminate playing of anything and everything."

It is interesting to note that the name "mechanical" or "automatic" does not really apply.

Twenty years ago one of the promoters of a forerunner of the piano-player said that he would yet make *a mechanical device which would do away with mechanical playing*, an instrument which would enable the player to express his varying moods and to employ his own individuality, upon the task of reproducing the masterpieces of art. Even then it was foreseen that *a mechanically invariable instrument would soon become intolerable and could never be anything more than a toy.* The prediction has been fulfilled. The instruments of this kind before the public are, and must always remain, toys.

While the sensitive piano-player eliminates the personality of the indifferent performer, and compels him to play in time and tune, it offers a wide sphere for the personal impress, and hence there is almost as great a variation of skill in playing it as between different players on the pianoforte.

Its shortcomings are many, but they are nothing compared with the service it is doing in bringing music to the people. For everything it cannot do that the exceptional player can do (and generally won't except at an immodest ransom) it can perform forty feats impossible to any player.

It can give us the rhythm and notes—*the melody, rhythm, harmony and form* of the 98 per cent. of unassimilated musical literature which lies engulfed by successive crazes for the Bastard New—and so bring back again, thru a wise eclecticism, the Golden Age of musical creation.

To the nucleus of musical outlines, *to the fixture of the staccato and legato element of phrasing so that it cannot be played wrong—by young ladies pathetically playing "with great feeling for the key,"* each player may add *what in him lies* of correct time values, dynamic shading, accentuation and the rest of the elements of delivery or phrasing, all depending ultimately upon the ability of the performer to grasp the true spirit of the composition. It will even enable him to gain this vital knowledge, and here success will vary with each man's gifts and opportunities, while running ink-lines upon the rolls of one instrument indicate authoritative tempo changes which will enable the posterity to know the individual ideas of leading conductors of today as to method of playing leading masterworks. One of the newest improvements of a leading player conquers the last outpost and enables the player to individualize the melody note, while subduing the accompaniment to a whisper.

Strongest of all its recommendations, and quite aside from the comparison with great artists, it will perform what no artist can play, entire quartets and symphonies with the parts as they fell from the composer's mind and not facilitated or adapted to the sharp and arbitrary limitations imposed by human fingers.

III.—If art is to advance, it must stand upon its own feet, and that thus no art can advance till its masterpieces have penetrated to the general mind, is a settled principle. So we may look to see Bach, Mozart and Beethoven and Haydn, penetrating thru our school systems to the multitude of listeners, occultating the musical harlotry and Bedlam of the coon song, the Popular Bandmaster's March, the unutterable inanities and vapidities produced by the modern manufacturer of "popular" music, which vie with our yellow journals and cheap sensationalism in every form in trying to make the world worse instead of better. For with Bach and Beethoven, the art of music was a goddess to be worshipped and not "a mammonite mother killing her babe for a burial fee."

In all this mass of trash which the public is gulled into accepting and applauding, there is no shred or atom of merit that is not a pale and vulgar reflection or use of principles invented by composers of art music, so that its very life, like the life of all things of the kind, is parasitic. That is, its evil is dead and works by appropriative alliances with the

good and the true. From this lack of perfect familiarity with leading masterworks results among other evils, the childish adulations of performers and their personalities, as if the public, in default of the composer's art, should throw itself in despair at the feet of the mediating executant, who at least is a palpitating, tangible reality.

The extent of music, which is the product of inspired composers which is to usher in our age of eclecticism and review of past treasures, is bewildering.

It took the German Bach Society fifty years merely to publish the works of Bach, probably the deepest of all musical thinkers. Of course even now they are published to the eye only, they are published and not published as Aristotle said of the works of Plato. A sublime Toccata sleeps in a vacant ear! Yet "to Bach," said Schumann, "music owes almost as great a debt as religion to its founder." Even Bach "lay for a century dead," till Mendelssohn discovered him. Schubert, the beloved of musicians, has 1,065 compositions. There are eighty-four string quartets of Haydn alone, each with some delightful characteristic of its composer. Morris Steinert has come, as an old man, to consider Haydn the greatest of all composers. His works are like fascinating children, the fountain at which we all renew our youth. Mozart, who, in his art, was a fullgrown man at fifteen, in other respects always remaining a child, has innumerable compositions, the product of his short but miraculous life. These, too, like infancy, are a kind of "Perpetual Messiah, which comes into the arms of fallen men to plead with them to return into Paradise."

How many musical enthusiasts could pass an examination in the well-tempered Clavichord of Bach, the "old testament" of music or in the Beethoven Sonatas, the "new?" Or in the six quartets of Mozart, dedicated to Haydn, at once the monuments of music and the serene Highlands of Hellenic spirit in modern art? There is said to be enough music on the shelves of Ricordi, of Milan, to set up the world for a long career. Even Beethoven, the Shakespeare of music, is largely unknown. The amateur will tell you that he has heard the Moonlight Sonata for piano, the Kreutzer Sonata for violin, the Waldstein, the Sonata Pathetique and the Fifth Symphony. But press him to tell you something of the sixteen quartets, of the last sonatas, of the B flat Trio, of the G Major Concerto and he will not be loquacious. Chopin, of course, is better known, disproportionally so perhaps, and alas! the morbid and unwholesome Symphony Pathetique of Tschaikowsky is by plebiscite the most popular of all symphonies! Ask the amateur to tell you something of the pinnacles which musicians delight in, the Chaconne and Passacaglia of Bach; the C Sharp Minor and third Rasoumoffsky quartets and the C minor, op. 111, and B flat Sonatas of Beethoven, the D Minor and G Major quartets and the celestial G Minor quartet of Schubert, he has never heard of them! All of which goes to show that there is probably no subject of human knowledge so hysterically admired and yet so little known to the public at large, as music.

IV.—To be sure the masterpieces of any art come out of and appeal to the *dreaming instinct in men,* whose time is not now, tho we must come to it again to be sane. And we can only come to it thru a long ruminative period such as is now upon us.

In London I was invited to hear the ensemble class in the Royal College of Music. "What are you going to do?" I asked. "Well," said the director, F. Arbos, "we shall play some things of Dvorák and Tschaikowsky. You see in England, while there is great interest in music, there is little real aptitude. I give them these things because my students have generally only a little emotionality and a little technique. With these two qualities, justice can be done to the music of today. If I were to attempt to teach them a quartet of Mozart, we should have to spend weeks over a single page."

When the mind opens and reveals the extent of the buried treasures of musical literature, the value of the piano player, as the only practical means of bringing them to light, is delightedly recognized by all the leading educators and intelligent musicians everywhere. Its use as a laboratory means of higher musical education is now a matter of course at

Harvard, Columbia, Amherst, Vassar, Tufts and fifty or sixty leading universities, colleges, normal and high schools, academies thruout the country.

Among honest musicians two classes of objectors are found—those who have never investigated the higher educational possibilities of the instrument and those who "see nothing in it" for them, and take coldly to what seems to them a device which seems to cut away the ground under them. They cannot afford to "hew to the line," fearing that the chips will fly in their faces. That this is largely a mistaken position is gradually being made evident. Real musical talent is instantly awakened and stimulated to higher activity by the flood of musical impressions pouring in at the porches of the ear. Students who are not fitted for producing music, but fitted with keen appreciative powers, are discovering the fact that a standard of valuation and intelligent powers of discrimination arising from familiarity is far more valuable than their own frustrated attempts at performance, and that a knowledge of musical compositions is no mean intellectual asset.

The very notes of these compositions are utterly beyond the powers of all but the gifted few, who must sacrifice to technique daily or suffer a falling off.

Teachers are finding that the field of teaching music with the piano player is a broad one, and includes those adults as well as the young who are hungering for the high prophylactic of art against the ills of the deadly life of commonplace.

For man is an artistic rather than a political animal, in spite of all appearances to the contrary, and is incorrigibly poetical. "O Celestial Bacchus, drive them mad, this multitude of vagabonds, hungry for eloquence, hungry for poetry to vitalize the too much pasture of their lives, and, in the long delay, indemnifying themselves with the false wine of alcohol, of politics, and of money."

In brief, it is dawning on the mind of musical man that music is primarily for the ear of the many rather than for the hand of the few. Recalcitrant pedagogs, who fear, mistakenly, that the vogue of the instrument will injure them, make one think of the pretty tale of John Swinton's related by Moncure Conway at the Author's Club on "Watchnight," 1906-1907. He said that "The human ears are not intended for hearing. That is a great mistake. The real object of the human ear is to enable us to discover when our companion has finished speaking, so that we can begin!"

V.—These changes must come slowly. The inertia of the established order can be overcome only with great difficulty.

The persistence of error long after its exposure is one of the mysteries of life. Sometimes the vindication is triumphant, sometimes satirical, as when the first steam vessel to cross the Atlantic carried in her cabin a copy of a book which had been written to prove that it was impossible that a vessel so propelled could make the journey. If vessels could talk, think of the "thrasonical brag" we should have. Still it is doubtful if it would convince like the mute dramatic irony of the actual event. "There is no use arguing against a balloon ascension," says Mr. Dooley. Another instance. The Payne-Collier Shakespeare forgeries were turned toward the light some fifty years ago. Yet in hundreds of books and magazine articles since, the Collier fraud is piously perpetuated. The good old world of routine goes its way scarcely the wiser for the labor of the high-minded apostles of truth who exposed the fraud.

In one of the largest American communities when it was first proposed, ten years ago, to put music into the schools, the new director received over 100 letters from teachers, some of them actually threatening his life, so bitter was the opposition to the innovation. At the present time music has nineteen supervisors in that city and the subject is held in high esteem.

Our coming generation of music lovers will know more musical compositions than the "professor" of long ago, and this will mean a new form of ideal benefit. For what is music if it be not an exquisite controller of the moods of the human soul—a picture of the inner world in miniature evolution; something *alive*, suggesting its moods, not thru the circuitous appeal to intellect, or depend-

ing for its effect upon high mental development, but reaching out to its hearers "from ungauged worlds in darkness hid," with a refined sensuousness directly affecting the entire nervous organization of whoever will give himself to its sensations?

No wonder we turn to it as the rainbow bridge which more directly than any other art carries us over dull areas of existence where no muse speaks, to the realm of the infinite, where we are sustained and fortified by the vision of abiding realities. We stand at the center of the eternal ways and receive the rays of the spirit as an immediate revelation; the direct expression now clear, now cloudy, of our relations to the Divine. It gives us, as in a shifting picture, the secret history of our interior hearts; the innumerable shades and degrees of satisfaction and despair which visit us are mirrored in its forms as in a tranquil sea, yet its tragedy and sorrow are ideal only, giving us pleasure of a high kind. "Like God, it sees only the heart," says Schopenhauer. "A kind of inarticulate, unfathomable speech," says Carlyle; "it carries us to the brink of the infinite and bids us gaze into that."

Rays of the divine fire falling upon our souls thru the manifestations of art, come most directly of all thru music, the organ of that spirit speaking to us under the veil of mysticism. That this is more or less clearly perceived by every one is shown by the widespread passion for hearing and enjoying music, which, as a universal language of the feelings—or soul—binds mankind together with invisible chords of sympathy.

The higher message of music cannot, however, impress us unless its creations become familiar by repetition and interpretation, and this for the first time in history is now possible.

"In the Hindoo fable, Siva goes to solicit the hand of the King's daughter. At the entrance to the palace strains of music fall upon his ear. He stops and listens. The music goes on and on, and finally ceases. Breathing a long sigh, he proceeds to enter the palace, only to find that the King is dead and his daughter married and gone. He is also astonished to observe that a long, white beard has grown upon his face. He had been listening twenty years."

NEW YORK CITY.

Literature and the College Examiner

BY GEORGE HENRY NETTLETON, Ph.D.

ASSISTANT PROFESSOR OF ENGLISH IN YALE UNIVERSITY.

"THE chief problem of the teacher of English in the preparatory school is how to fit his pupils to pass the college entrance examinations without permanently destroying their love for literature." Such was the deliberate assertion of a high school master of experience and ability at a recent educational conference in New England. Is this serious indictment just? Can the lover of literature bring in a true bill against the college examiner?

Three Estates, so to speak, are vitally concerned with college entrance examinations—the candidate, his tutor, and the college examiner. Habitually, the entrance examination is viewed as the test of the candidate. Incidentally, it often becomes at least a rough measure of the tutor's efficiency. For once it may profitably be regarded as the test of the college examiner himself. The college is apt to blame the preparatory school for the shortcomings of its applicants for admission. Can the college itself do no wrong? Much good ink is shed yearly in discussion of educational ideals for preparatory schools, but so long as the college examiner remains the final judge, from whose verdict no effective appeal can be taken, the secondary schools must inevitably conform in large measure to the methods of the particular court before which the cases of their pupils come to trial. Obviously, thoro efficiency on the part of the tutor and marked ability on the part of the pupil often combine to make the specific form of examination a matter of little or no moment. Still the truth, however unpleasant, cannot be dis-

guised that the tutor may often endanger his pupil's chance of success if he seeks to secure his ends regardless of the divinity that shapes them. Inevitably the preparatory school models its curriculum after the law of college requirements, and for interpretation of the spirit of that law looks naturally to the entrance examinations. Admitting, then, necessarily that the college influences vitally not merely the amount but the method of preparation to meet its own requirements, it is a significant question to ask, On what terms are Literature and the College Examiner? Do the college entrance examination in English tend to destroy the love of literature?

To secure direct testimony of practical value the following question was inserted in one of the September entrance examinations of the Sheffield Scientific School of Yale University: "Describe in detail the method of your preparation for the examination on Milton's minor poems." The answers quoted subsequently are taken verbatim, but some crudities of expression may be forgiven in view of the transparent honesty of most of the writers. Few candidates, to be sure, were as ingenuous as the one who wrote: "I prepared for this examination on the Fall River boat." There remain, however, answers equally honest and more illuminative. At the outset it is well to explain that, for present purposes, certain papers reflecting intelligent study and rational instruction must be put aside. None but a confirmed pessimist could expect to find in the wide range of students and teachers of Milton in the preparatory schools that all should be

> "dark, dark, dark, amid the blaze of noon,
> Irrecoverably dark, total eclipse
> Without all hope of day!"

On the other hand, even if college entrance examinations could be set which would satisfy the most captious critic, even an optimist could hardly expect that the work of every candidate would reflect ideal methods of preparation. Investigation, then, turns rather to the mean between the extremes of excellence and deficiency. What does the average preparatory school boy find in Milton? What is he usually taught to discover? How, to put a bald question baldly, does the average teacher strive to fit the average pupil to satisfy the college requirements in the study and interpretation of Milton? Before attempting even general answers to such queries, it is fair to present specific evidence from which conclusions may be drawn.

A typical answer taken almost at random, reads:

> "My preparation on Milton's minor poems was pretty much like this. The first day when we all received our books the master went over 'L'Allegro' and explained different words and passages to us. These we were to underline and at the next recitation we were to be able to tell him what they meant. 'Il Penseroso' was gone over in a like manner. . . . 'Lycidas' was then taken up, and first we had to learn for what occasion it was written. The rest of the preparation on 'Lycidas' was like that on the other two poems. The preparation on 'Comus' was very similar. We had several examinations which were copied from former college ones where we had passages given to us which we had to locate in the poems, and tell by whom and to whom they were said and to explain the words and phrases in italics."

Another, whose simplified spelling is reproduced *literatim,* writes:

> "I prepared Milton's poems by reading them line by line with the notes. Then I went over them again, looking up all names of gods, godesses, and shepards. After that I took up composition work. Finally I reviewed different college entrance papers."

A third says:

> "We studied them [Milton's minor poems] very carefully, over and over again, learning all the meanings of the important words. I was taken over the notes in ————'s English Series. These notes I was supposed to have learned perfectly. After learning the etymology of these words in the notes I was taken over the poems carefully again."

The phrasing suggests instinctively that you may lead the student to the Pierian spring, but it is difficult at times to make him drink deeply.

A fourth writes:

> "Each line of the poem was taken word by word and the pupil had to tell in his or her own way just what he thought the author himself meant by the sayings. Then we were told to take notes from the criticisms of other authors which the teacher read to us. Finally we were given an examination, in which we were to tell everything about each line so as to be sure he would not omit anything which he might do if he gave it to us in topics."

Whoever believes with Pope that "the sound must seem an echo to the sense," will find a certain appropriateness even in the faulty reference of the pronouns.

Another answer runs:

> "The first lesson that was assigned was reading so many lines and learning the meanings of

the marked words. Then we had to learn the meter and how to scan. We looked up each allusion and put them in a notebook for reference. All this was done over three times in the course of the year."

One dominant note, indeed, is sounded constantly—that of Local Allusion.

"Our work in class was almost all on allusions"; "We were taught to pay special attention to the mythological references"; "I studied all the unknown words and all the allusions"; "The instructor went over the poems, picking them to pieces very carefully. We were required to learn the meanings of all Greek and Roman names"; "I have been taught to write paragraphs on different lines, giving the meaning of all the references. I have also looked up all the mythological references, thereby getting the full meaning of the different poems."

The empty song repeats itself. One who spoke wiser than he was aware of said: "We took Milton line by line, and the teacher explained away every illusion."

Even from the brief testimony already given, one point must be apparent—that bad eminence to which Local Allusion has been raised. Consciously or unconsciously, an alarmingly large number of candidates for college have learned to regard Milton's minor poems chiefly as a maze trodden by "gods, godesses and shepards," and penetrable by no other clue than by tracing, line by line, the devious course of explanatory notes. That this process is usually a weariness to the flesh is evident between the lines, if not, in fact, in the perfunctory phrasing of the very lines themselves. But direct testimony may be added:

"Milton's minor poems are very deep, or at least we were taught to find them so, as it requires long study and good use of the Index, Glossary, Notes, and Dictionary to understand them."

Here even the capitals are eloquent. Doubtless the College Examiner would run the gauntlet of ridicule should he some day insert this question on the entrance paper: "Do you consider that Milton should be regarded primarily as a storehouse of mythological and linguistic reference, or as a poet?" Can it be that he has at times lent his influence in such a way as to justify such a question?

Almost at the outset of this discussion it was assumed that the college entrance examinations themselves seriously influence the methods of those preparing to encounter them. That this assumption was warranted there is direct and ample proof. Again and again the candidate confesses, or even boasts, that he has been thoroly drilled on former college entrance papers. "We took old college questions," writes one, "and memorized answers to each one of them." Says another: "I made my preparation for this examination with certain typewritten papers called College Reviews. These papers contain most of the questions that can possibly be asked, with answers corresponding to them. I studied the subject by means of these papers, and feel thoroly convinced that I will pass this examination." It is not wholly to the point to add that this confidence proved misplaced. The point is that the candidate, quick to take his cue from experience, in reality voices Browning's line—"the Future I may face now I have proved the Past."

With the evidence in hand we are in a better position to return to the original charge against the college examiner. To rest the case for the moment on a single count, is it true that the college entrance examinations on Milton have tended to destroy the love of Milton? Frankly speaking, the experience of average candidates points on the whole to such a conclusion. Whatever the shortcomings of the preparatory school boy and of his tutor, it seems impossible to absolve the college examiner from all responsibility in the matter. Each of the Three Estates concerned with the entrance examinations has, doubtless, individual faults, for which it alone should be held responsible. But the evident duty of the college examiner is to set, year by year, a series of tests so rational and so consistent that neither the candidate nor his tutor can fail to recognize the essential spirit by which the letter of the English requirements is to be interpreted. Unless "English Literature A" and "English Literature B" are to be regarded merely as assumed names for "English Linguistics," and unless the statements in college catalogs are to be brought into conformity with such an interpretation of the requirements, the entrance examinations must be framed so that technical drill and linguistic discipline shall not appear to be the whole duty of the student. Yet, in so far as any consistent

generalization can be drawn from the inconsistent practices of college examiners, the fact is that the entrance papers in English have in large measure induced methods of preparation to meet them which run directly counter to their supposed purpose. Not until the colleges maintain rational entrance standards can they rightly deny *in toto* the charges preferred against them.

Objection will at once be raised by some of the timorous that the minutely technical examination, however unfortunate at times in results, cannot be replaced by one conceived on broader lines without sacrifice of scholastic standards. "General questions are too easy." is the wail even of some sincere lovers of literature. But is the danger real? In the examination which included the query as to methods of preparation upon Milton not a single question was asked which involved technical drill in linguistics, local allusions, or mythological or other references. Yet of seventy-five papers taken absolutely at random it was possible to pass but fifteen. It is apparent that this is but a rough test. Experience with many similar examinations during the past few years, however, makes it equally apparent that, with proper questions and a reasonable standard of required excellence, the general examination is at least as difficult as the more minute examination of years ago. That the results of these later tests are more acceptable to the preparatory school teacher there is voluntary testimony. "With the technical examination," said in substance a competent teacher, "the boy fares best who crams best and repeats parrot-fashion what is drilled into him. Some of our most satisfactory pupils often fail in such tests. With broader and fairer questions the good men pass, and the men who fail ought to do so. But so long as most of the colleges seem determined to set catch-questions, we have to spend our time chiefly in drill on dull details."

Fortunately there are signs that many college examiners recognize that unsatisfactory conditions are prevalent, and seek to remedy them. The list of books accepted by practically all the colleges as a uniform standard of requirement is encountering frequent and vigorous criticism. The question of specific changes in the actual requirements is, however, apart from the main purpose of this discussion. From the testimony already cited it might not be difficult to argue that Milton is out of place on the entrance list, but far more essential than revision of the letter of the law is change in the spirit of its interpretation. To substitute some alternative for Milton would be of little profit, if the college examination continued to insist upon technical drill to the practical exclusion of more vital matters. Radical revision of the details of requirement may be devoutly to be wished, but there is no need to await the tardy process of such reform in order to inaugurate a change in attitude from insistence upon petty detail to a broader conception of the real purpose of the examination test.

Apparently a new spirit is stirring not merely the face of the waters, but the currents that run deep. The New England colleges, in particular, are growing restive under restraints which have hitherto provoked little effective resistance. At a recent conference held at Providence they took decisive steps toward the reconstruction of the entrance requirements in English. More important, even, than recommendations pointing toward future improvement in the tangible requirements, was the immediate formulation of opinion as to the principles which should control the form and spirit of the college examinations. "English B," the chief target of attack on account of its tendencies to insist on minute trivialities, was shorn of its most objectionable features by the ultimate adoption of this significant statement as to its treatment: "The examination is not designed to require minute drill in difficulties of verbal expression, unimportant allusions, or technical details." Simple and commonplace this seems, but if attack were to be instituted upon all college examiners who have failed at times to conform to this rational principle there would be few to cast the first stone. The consistent application of the spirit of this declaration to all the entrance tests would result in a sweeping reform of many of the worst evils for which the examiners stand at present indicted.

New Haven, Conn.

An Estimate of Andrew Carnegie

BY HERBERT N. CASSON

[Last week the Simplified Spelling Board celebrated its first anniversary and Mr. Carnegie presided. This week Mr. Carnegie opens his great Technical Institute at Pittsburg, and entertains a carload of celebrities there whom he has brought over from Europe as his guests. Next week the National Peace and Arbitration Congress will hold its three days' session in New York and Mr. Carnegie will preside. For his creation and support of institutions for educational and social betterment, whether local or international, he might be called the Maecenas of the world. Mr. Casson, who contributes the following estimate of Mr. Carnegie, has previously contributed to THE INDEPENDENT various articles on sociological topics. He has recently spent a year or more in writing a history of the United States Steel Corporation, and has consequently had exceptional facilities for studying the creator of the American steel industry.—EDITOR.]

WHILE the time has not yet arrived—and will not for many years, I trust—to say the final word about Andrew Carnegie, that does not appear to be an adequate reason for many of the superficial estimates which are being made of the man and his work.

The one fact that Carnegie is rich—preposterously rich in a world of poor people—should not obscure certain other facts in his unique life history. The truth is that the distinctive features of his career are neither his wealth nor his philanthropy. John D. Rockefeller and the late Alfred Beit have beaten him in the getting of money; and many a less affluent man has been relatively more generous.

Those who would view Carnegie fairly and comprehensively may see him in four quite different aspects, each of which, in my opinion, reveals him as the most eminent of his class. These may be expressed briefly as follows:

First: A Business Builder.—It is due to Carnegian enterprise, more than to any other one cause, that the United States is now producing two-fifths of all the iron and steel in the world. When Carnegie was born, England made more iron in one day than we did in five, and at the time that he entered the iron business there were fifty-nine Bessemer plants in Europe and only three (very small ones) in this country. Our iron and steel works were called "sickly, hothouse plants" by English writers; and few, even among Americans, believed that our furnaces and steel mills could ever compete with those of England and Germany.

The pre-Carnegian iron making in America had been two centuries of struggle and failure. The Sheffield iron was being made from Spanish ore, and transported to Pittsburg across the ocean and the Allegheny trail, more cheaply than it could be made on the banks of the Monongahela. Roughly speaking, American iron had been of poor quality, and steel had been worse.

Into this wreckage came Carnegie, with as great faith in the future of steel as John Knox had in the Bible. He organized and enlarged and threw all profits back into the business, in bad years and in good years alike, until Europe listened with amazement to the wonderful records of Homestead, Braddock and Duquesne. That he was assisted by the Morrill tariff and the new era of railway building is true; but the dour little Scot himself was unquestionably the main factor. Had it not been for the Carnegie system of getting the best men and machinery and demanding the best results, we would not today have an iron and steel industry that is supporting a million working people and paying profits on two billions of capital.

Carnegie was the first steel maker in any country who flung good machinery on the scrap-heap merely because something better had been invented. He was the first to employ a salaried chemist, and to appreciate science in its relation to manufacturing. Nothing was too good or too expensive for his furnaces and steel mills. In his early days he was the biggest borrower in Pennsylvania; and when the profits grew large they were poured back to fertilize the soil from which they grew. There were two busy

years, for instance, when he expended twenty millions upon improvements alone.

He raised wages to the highest point they have ever reached, before or since. His first great mill manager—Captain Jones—drew a salary as large as though he had been the occupant of the White House; and there was many a Pittsburg roller, in the heyday of the Carnegie régime, who received from $12 to $40 a day.

So it is clear that primarily the aim of Andrew Carnegie was not to make large dividends nor to sell stock, but to establish a solid and enduring industrial structure. First of all, he was a business builder; and the present unequaled prosperity in our iron and steel trade is largely due to the fact that American steel makers have adopted the Carnegian policy of ranking improvements above dividends.

Second: An Executive Trainer.—Mr. Carnegie was not only a maker of steel. He was a maker of steel makers—the greatest of his time. H. C. Frick, the ablest American steel maker now in active service, by whose advice the United States Steel Corporation is mainly directed, was trained for ten years under Carnegie. Other distinguished graduates are James Gayley, Charles M. Schwab, W. E. Corey, A. C. Dinkey and Thomas Morrison.

The Carnegie Company was a Napoleonic republic. The private soldier carried a marshal's baton in his knapsack. The eye of the "Little Boss" saw everywhere. Promotion was by merit. There was no elevation of stupid relatives nor of aged mediocrities. Each man held his place just as long as he could do the work better than any one else, and no longer.

In all, forty-three workmen of various grades were picked out by Carnegie, given shares of stock, and transformed into partners. Each was made responsible for a certain part of the business. By giving these young partners a free hand and requiring them to send him a daily report, he pushed them up to the highest degree of efficiency. He pitted one against the other and incessantly goaded them on to beat the record of yesterday. It meant the introduction of department-store methods into the steel business, and it succeeded to a sensational degree. As Jeans, the steel historian of England, has said: "No other system has ever made so many men wealthy in so short a time."

Third: A Wealth Master.—Apart from Carnegie's contributions to the world of commerce and manufacture, he has rendered an inestimable service by the manner in which he has made wealth subordinate to the higher purposes of life. He has never been what most rich men are—the valet of a fortune. When he was a propertyless clerk, he resigned his position to enjoy a walking tour thru Great Britain; and afterward, when his wealth had grown to be greater than that of an emperor, he refused to surrender to its demands. His dollars were never almighty; they were taught to keep their place.

Of all steel makers, he was the first to introduce a system of absentee management. The traditions of the business required that the owner of the furnaces and steel mills should plod and swelter along under the smoke, side by side with his men. But Carnegie, who has crossed the Atlantic sixty times and been once around the world, has at all times valued his liberty and his associations with literary men too highly to be the chattel of his business. He lived his life, whether the market went up or down.

In fact, when all his activities are considered, it is much easier to imagine him as a university dean, with a hobby for steel making, than as a steel maker with a hobby for education. He has even, in his "Gospel of Wealth," developed his inclinations into a philosophy. No one else has inveighed so strongly against the dangers of riches. "If I had a son," he said recently, "I would sooner leave him a curse than a fortune."

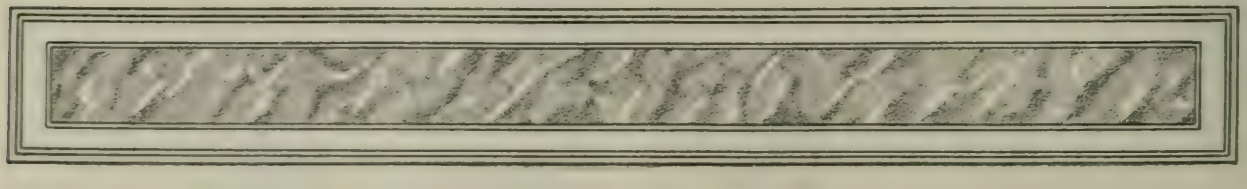
Fourth: A Civilization Designer.—If I may be permitted to coin this Teutonic phrase, it is the one which seems to me to best express the real avocation of Andrew Carnegie. Instead of accepting the world as he found it, and pouring his surplus wealth into the hoppers of conventional charities, he has from the first used his riches for a large, constructive purpose. He is not satisfied with civilization and the breed of human beings it is producing. He holds that while today is better than yesterday, tomorrow should be better still; and he has a very

definite idea as to what the line of improvement should be.

In all, he has given away about $125,000,000 in the past thirty years. But he has built no churches, missions, Young Men's Christian Associations, soup kitchens nor hospitals. Outside of a large fund for the relief of injured or needy steel workers, and a long private pension list, he has given nothing to the sick or the poor. "Nothing for the submerged" has been the motto of this Scottish stoic. And the reason for this is not a lack of sympathy, but a keen discernment that the aim of all social betterment should be to remove the causes of trouble, and not to tinker in a futile way with results.

Carnegie has thus been as original in his giving as in his getting. A philanthropist in the ordinary sense he has never been. He has his own idea of what the world should be; and he gives millions, writes books, makes speeches and argues with statesmen to compel the carrying out of his plans for the human race.

If he could have his way, for instance, he would abolish all kingship, militarism and aristocracy. To this end he wrote "Triumphant Democracy" and "The Empire of Business." He offered to pay twenty millions for the liberation of the Filipinos, to avert the menace of imperialism. He established his notable hero fund, so that the idea should not prevail that courage was mainly a military virtue. And he is now building a superb, white Temple of Peace at The Hague, so that arbitration may supersede war. If he could have his will altogether, he would, no doubt, put every army, generals included, to work in the iron mines, and transform every navy into a fleet of ore ships.



He believes in the democratization of knowledge, and not in the creation of a cultured class. Here is the reason for his fifteen hundred libraries, widely scattered thruout the English-speaking world. A free library is an educational ladder which has rungs at the bottom—so low that the poorest can reach them if he tries. Remembering his own boyhood struggles for an education, Carnegie is resolved that, so far as he can prevent it, no great brain shall remain undeveloped because of poverty. Genius is a rare plant that may spring up in any soil, and we must make provision for it everywhere.

The reason why he gives money to small colleges and not to the great universities is probably because the former have fewer rich men's sons as students, and more who are climbing up by their own efforts. Make knowledge accessible, not remote—that is the central point in his philosophy of education. And for the sake of giving especial aid to men of especial ability, he has founded the Carnegie Institution. His instructions to the managers of this unique enterprise, after he had given it ten millions, were simply this: "Find the exceptional man and help him."

Both in steel making and civilization making he has had little respect for the old ways. He is in favor of simplified business and simplified spelling. He would as soon go back to the tilting hammer and the slitting mill of his fathers as to write "ugh" at the end of "tho." He would sooner trust the enthusiasm of youth than the experience of age. This, very likely, is a side reason for his policy of providing pensions for old professors. It serves the double purpose of rewarding a class of men who are shamefully underpaid and at the same time pushes the younger professors into control.

So, to conclude this outline sketch of Mr. Carnegie, it is evident that he is much more than a "Jubilee plunger of beneficence." It would be far nearer to the truth to regard him as a shaper of world policies — possibly as the most original and creative American of the last half century.

New York City.

How the Manufacturers Are Holding Up Retail Prices

BY ELTWEED POMEROY, A. M.

[Mr. Pomeroy is a New Jersey manufacturer who has contributed various articles to THE INDEPENDENT on his business experiences. He has always been interested in political and social reform and has published much on the subject.—EDITOR.]

A SCORE of years ago no manufacturer considered retail prices. He made the goods and sold them at wholesale and that ended it; it was up to the retailer to get a living profit from their sale.

Two great but little noticed movements have changed the point of view of most manufacturers. First, the manufacturers found that unrestrained competition meant their own destruction, for they could not get a living profit out of the goods they made; so if they have not actually consolidated they have agreed to a common selling price on standard goods. On goods protected by patents or by widely advertised brands, this has not been so necessary, but an agreement is not uncommon even in these. With at first numerous but now rapidly decreasing exceptions, these agreements are being lived up to. In the stationery business, with which I am familiar, these agreements cover more or less completely such lines as ledger papers, fine writing papers, printing papers, cover papers, etc., playing cards, files, inkstands, inks, mucilages, blank books, pens, pencils, leather goods, envelopes and many other items.

The second cause is the increase of brand goods. Manufacturers are advertising more and more and consumers are relying more and more on some brand that they know. They have found out that an article without the manufacturer's name or brand on it is usually an article of which he is ashamed, and is only sold because it is cheaply and poorly made and can be sold at a very low price. So the number and use of brand goods are rapidly increasing. I recently saw in a street car the advertisement of a brand of eggs sold only in sealed packages, each bearing the date when laid.

Now there is a radical difference between brand and non-brand goods in selling. On the latter, the manufacturer can do little as to price maintenance unless he has a monopoly. The dealers can combine, as they have in many cities, for a common price, but the manufacturer can do almost nothing. On brand goods, the dealers can combine for price maintenance just as on non-brand goods, but the manufacturer can also fix the retail price and refuse to sell to the dealers who do not live up to it. If he advertises widely enough, the dealer will have to sell at least a few; if he does not advertise, the dealer will or will not sell, as he sees fit.

The manufacturer of brand goods has been forced to consider retail prices. A department or other store will sell well-known goods at cost or less, in order to lead people to think that it has unusual facilities in buying or is selling at unusually low rates of profit. Such stores will thus attract business and make up their profits on other goods, whose price is less well known or by substituting

cheaper goods on other lines. Thus recently one of New York's largest department stores advertised to sell for five cents a well-advertised ink which usually retails for twenty-five cents, and which I am positive cannot be bought for less than $21 a gross in five-gross lots, or nearly fifteen cents each. I wanted a fine rug for my house, and found the same rug in this department store and in another store, supposed to be one of the high-priced carpet stores in New York City, and in this latter store it was 25 per cent. cheaper. The department store made up for the loss on the ink, of which every one knew the price, by charging more for the rug, where the variety of patterns and prices renders comparison almost impossible.

The result of this is that the regular dealer, finding that he cannot make a living profit on these goods, which perhaps are his main dependence, either sinks into a disheartened small dealer in small goods at small profits or else discourages the sale of this line and sells others that the department store or cutter does not handle.

Meanwhile the price cutter soon gets all the reputation available out of cutting on this line of goods, and after a first large sale soon ceases to handle them and switches his trade to other brand goods on which he makes a profit. The manufacturer is then left with shrunken sales and a disheartened and embittered set of dealers in his goods.

At one time many manufacturers thought the department stores were great institutions because they bought large bills and paid promptly, but now it is not at all uncommon for a manufacturer to advertise to the trade that he does not sell to certain well-known, "cut-throat" stores, and he lives up to it, too. If he does not, he is apt to receive an avalanch of letters; and tho none of these writing customers may buy as large a bill as the "cutter," in the aggregate they buy much more and buy far more continuously.

Out of this has grown price maintenance by manufacturers' contract. A manufacturer hands a dealer a contract by which the dealer agrees not to sell these goods below certain specified prices and in return the manufacturer agrees not to sell to any dealer who refuses to sign and live up to this contract.

Few are aware of the great number and variety of goods which are sold on such a price contract practically forced by the manufacturer but also welcomed by the first-class dealers. Among these goods are certain well-known carpet-sweepers, hats, shirts, watches, cameras, collars and cuffs, filing devices and office furniture and fountain pens. These and a host of patent medicines are entirely or partly sold under such contracts; and the list could be lengthened to fill this whole magazine.

One of the most prominent of these manufacturers said recently in a little publication that it sends to the trade: "We believe the fixation of a definite selling price of a proprietary article must depend almost entirely upon the manufacturer." This firm does not sell any goods save under contract. Its head, in a personal letter to the writer which he has permission to use, wrote: "We make the demand and insist on its being supplied as we indicate. The profit we allow is fair, running from a third to 50 per cent., and we recognize as important the individual efforts of the dealers in assisting our advertising; we endeavor to combine the merchant's influence with our own." They have carried this so far that they refuse to sell the co-operative stores because such stores give a dividend to purchasers who are members.

In another line, the dealer first signs a statement that he will not sell at less than certain prices and will not sell any other brand of goods of the same kind. The goods are then billed to him at slightly varying discounts, from 20 per cent. to 30 per cent. At the end of the month, he has to sign a statement that he has lived up to this contract, and a second one at the end of the second month, when, if there is no proof of his having violated his agreement, he gets a rebate of from 12 per cent. to 15 per cent. and pays his bill. But he does not get his rebate unless he lives up to his contract, and a dealer who has once violated his contract finds it very hard to buy these goods again even if thoroly repentant.

Manufacturers are almost forced to advertising and then to a contract. Such

is the multiplicity of goods that are now being sold that the dealer can rarely give one line the attention it deserves. In fact, a publisher recently said to me that soon the manufacturers would really do the bulk of the selling of goods thru magazine and other advertising, and our merchants would largely pass out of existence and be superseded by the $5 or $7 a week girl who simply handed out something, she did not know much what, that the manufacturer had made a demand for.

The general sales manager of one of the largest and best companies manufacturing office furniture, recently wrote me:

"We have been compelled to adopt the policy of opening branch houses, of reducing the discount we give dealers and of selling only under contract. The dealers would not give the business the attention it deserved. Some years ago, our selling prices were based on a long list with large discount to the trade. In every possible way we endeavored to maintain this list, but the stationers persistently cut the catalog prices from 10 per cent. to 30 per cent., so that probably 90 per cent. of the sales were made at an average profit of 15 per cent., and they had to pay their own freight charges. It seemed impossible to stop this cutting; so we were compelled to change our policy, reduce the list prices and reduce the discount to dealers to correspond. This change has not only been beneficial to the dealers, but placed us right before the public. Formerly our catalog prices meant nothing to the man who shopped; the easy man paid them. Now shopping has been eliminated."

At once, someone says: "Is not this a combination in restraint of trade and illegal under the Sherman or some other law"? Undoubtedly trade associations have done acts in fixing common prices that could be legally stopped if known and proved, and possibly with heavy penalties in many States.

If manufacturers combine and agree to raise or even keep prices at a certain level, their action would likely come under the head of a conspiracy. The Publishers' Association in New York recently lost a suit against R. H. Macy & Co. on just this ground. In Philadelphia, the Druggists' Association was recently assessed for something like $30,000 in a suit against them by a local druggist named Loder, for damages because the manufacturers and jobbers of patent medicines had combined in an association and agreed not to sell him as long as he cut prices.

But that which becomes a conspiracy when more than one agree to do it, is legal for one firm or one corporation to do. A man has a right to do with his own goods as he sees fit. If I have a plot of land and sell it to you with the restriction that you shall not resell for less than $30 a front foot and shall not build a house on it of less than $6,000 in value, and that no two-family house shall be built on it, and if you buy the land with these restrictions on it, that bargain is legal. If I sell you a watch with the restriction that you shall not sell it for less than a dollar and you agree to this when buying the watch, that restriction is legal. If I have patents or copyrights on my goods, my position is still stronger.

The firm I am connected with recently sent circulars to all their dealers asking what they thought of such a price contract and whether they would support it. Of the answers 87.5 per cent. said yes, a few with some qualifications; 2.8 per cent. did not answer and 9.7 per cent. said no. The dealers over the country welcome such a contract.

To the business man, these facts in his own line are well known; but to the general public, the extent and rapid and strong growth of these methods in the past, and the promise of still more rapid growth in the near future, are utterly unknown. What does it mean? It is a fulfilment of the great engineer Stephenson's words: "Where combination is possible, competition is impossible." To be sure, this sort of combination comes from above and is autocratic, but it is welcomed by the dealer.

There are two dangers in it, a present and a future one. It is a three-party agreement between the manufacturer, the dealer and the public, and the public has nothing to say about it. The present danger is that the interest of the public will be neglected and prices raised and kept too high. Competition has forced many retail prices too low. As a rule they are not yet too high, but there is this present danger in the movement.

These contract arrangements, when well-drawn and well-operated, makes the business of the manufacturer and dealer run along so smoothly that there is serious danger of dry-rot. Because the dealer makes a good profit and handles goods that are already half sold, he is

disinclined to try anything new; hence the channels of trade are largely shut to new goods no matter how meritorious. This is the future danger.

The advantages are that it makes business easier, more uniform, more certain of profit; hence if the monopoly element does not creep in, the profits, because more uniform, will be lower. The buyer feels that he buys what he wants, perhaps not at the lowest prices the goods could be sold at, but at the lowest prices they are sold at, because the price is uniform all over.

The Socialist says that this is one of the many extra governmental methods which our society is adopting of its own accord to prepare the way for the governmental taking over of the means of production, distribution and exchange, which is his goal; perhaps he is right, time only can tell.

NEWARK, N. J.

The Last Journey

BY HARRY H. KEMP

I PAUSED awhile
With careworn smile
Above my somber bed.
I checked my flight
At the strange, strange sight
Of mine own body, dead.

And yet it seemed
I had but dreamed
Before, and, now awake,
Went forth on wings
To real things
As one whom dreams forsake.

In little time
I saw, sublime,
The earth beneath me swoon;
And soon did slip
By the slender tip
Of the thin and silver moon.

Full joyously
In the wake of me
I left star after star:
Thus faith doth run
From sun to sun
To where God's glories are.

And next I oared
Where glowed and roared
That stream of stars which burns
Along the sky,
Poured out on high
From God's pellucid urns.

When I had gained
Where flamed and waned
The last prodigious sun
I met vast shoals
Of kindred souls
Veering toward God's high throne.

Outsped and past
We left at last
The starry universe—
(From heaven afar
God counts each star
Like silver in a purse—

Tho unto us
Innumerous
As all the ocean-sand,
Of small amount
In God's account,
They merely fill his hand.
Yea: He can heap
Them nadir-deep
In the hollow of his hand.)

Next came we straight
To Heaven's gate
Where, clad in bright attire,
Two angels loom
Athwart the gloom
Like pyramids of fire.

Colossal-rolled
The gates unfold;
The inner vision grows;
And on our eyes
Dawns paradise
Opening like a rose.

Then toward us came
Clothed in a flame—
A sharp baptismal sword—
The loveliest word
Love ever heard
"'Welcome' thus saith the Lord."

New Appeals for Peace

APPRECIATION of the folly and waste of war is perceptibly growing. International conferences and congresses multiply. On April 14th the New York Peace Society will hold a convention which, for the official power of the orators, the social importance of the organizers and the intensity of the interest aroused, could have been arranged by no such society until recently. A second Hague Congress is in prospect; the International Parliamentary Union is firmly established; a permanent tribunal to which international disputes may be referred is in existence. But the old appeals of members of peace societies, the call to pity for the sufferings that war incurs and to the thrift that revolts against its wastes, are felt by Jane Addams and Harold Bolce* to be old-fashioned and ineffective. Each of them offers fresh motives for renouncing allegiance to the God of War and reasons for hoping that his devotees will dwindle ever faster.

Mr. Bolce is material; Miss Addams spiritual. He puts his trust in the development of international trade; she detects the development of cosmopolitan friendship. One sees in the financiers and merchants the architects of the new internationalism; the other finds among the feeblest immigrants the harbingers of the new ideals. But the books are complementary, not contradictory. Both are carefully written and express views legitimately reached thru personal experience. Mr. Bolce has traveled around the world, interviewing industrial and political rulers; Miss Addams has worked among the inchoate masses of Chicago, chumming with polyglot immigrants and feeling with the oppressed. Their styles correspond with their experiences and point of view. The man's is clear, concrete, statistical; the woman's philosophic, tender, somewhat vague. It is pleasant to find that, approaching the matter by avenues so wide apart and with temperaments so antipodal these writers both discover forces that make for international peace.

Mr. Bolce does not rely upon the money cost of armies and navies to cause their dispersal, tho he shows that the nations are fatuously spending $3,000,000,000 a year in order to protect an international trade that yields a profit of only $2,400,000,000. A merchant who should spend on watchmen more than his annual profits would be put in a sanitarium; unfortunately there is no power to place peoples under similar restraint when they do the same thing. But as international trade grows and credit expands, as the commitments of financiers in different lands multiply, and as industrial connections ramify across the oceans, the resulting panic when war disturbs one nation will be so disastrous to all nations that financiers, who control statesmen, will forbid the declaration of war. Such is Mr. Bolce's forecast.

So many similar hopes have been belied that our confidence is shaken. De Bloch predicted that the perfection of war's weapons would make war impossible; but the Japanese have shown how night attacks and scientific audacity, united with indifference to death, can conquer armies and capture fortresses despite arms of precision. Commerce, it was promised, would supersede war; but nations now go to war most often to extend their commerce. The military budgets, it was hoped, would prove unbearably heavy and force the gasping peoples to hail the dove of peace; but wealth has grown as fast as the budgets, and "the past ten years have witnessed a world saturnalia of success." Germany, one of the most burdened, has answered the drum call of the Emperor by returning to the Reichstag a thumping majority to support his military, naval and colonial policy. Therefore we are not sure that, should America adopt free trade and develop that vast European market which Mr. Bolce would have her enter, the short cut to universal peace will have been discovered.

Neither does Miss Addams's reliance

* NEWER IDEALS OF PEACE. *By Jane Addams.* New York: The Macmillan Co. $1.25.

THE NEW INTERNATIONALISM. *By Harold Bolce.* New York: D. Appleton & Co. $1.50.

upon the spontaneous impulses of East Side city crowds satisfy us. Her adaptation of early Christian doctrine to the interpretation of democracy is suggestive, but not final. In matters of social and civic organization it is not safe to assume that "these things ye have hidden from the wise and prudent and revealed them unto babes." Suffering, failure and ignorance may be good soil on which to grow meekness and humility of spirit; they are not the best preparation for statesmanship. As a depressing matter of fact, it may be recalled that the Hooligans of London stoned the opponents of the Boer War and made the streets hideous on Mafeking night; the east sides of New York and Chicago yelled "Remember the 'Maine'" as loudly as any other quarters. Doubtless, as Miss Addams argues, the war spirit of antagonism is incompatible with the democratic spirit of social co-operation. In her splendid chapter on "Utilization of Women in City Government," in which she gets clear of her assumption that wisdom and virtue most affect garrets and cellars, and in her treatment of the child problem, in which she recognizes that democracy is government by all, by the educated and successful as well as by the ignorant and feeble, she makes some discriminating and true suggestions respecting the development, thru social organization, of those heroic, generous qualities that have hitherto been erroneously associated exclusively with the battlefield. She discerns the first, faint stirrings of a new ideal and catches them, as the astronomer, on his photographic film, fixes the glimmering of stars too dim for the naked eye to catch.

Philosophy and Religion

PROFESSOR POWELL'S study of Spinoza and his particular utterances in regard to religion[1] forms an interesting addition to the literature on Spinoza. Dr. Powell endeavors to prove that Spinoza, until now considered by many of his most vehement opponents as the religious philosopher *par excellence,* was not religious at all. In the first chapter of his introduction (pp. 1-44) the author, availing himself of the latest researches by Freudenthal, Pollock and Martineau, furnishes a complete sketch of Spinoza's life. It is in the second chapter in which he acquaints the reader with the diversity of opinion in regard to Spinoza's relation to religion that Professor Powell begins to show the *raison d'être* of his book, viz., to attack the honesty and integrity of Spinoza. Here are the Professor's own words:

> "It is certain therefore that Spinoza's timidity, or, if you will, his peaceable disposition, as well as his theoretical maxims, determined him, when dealing privately with individuals of religious interest, sometimes to conceal and sometimes to veil his real opinions, and occasionally even to express views diametrically opposed to his own."

The exposure of the flaws and fallacies in Spinoza's system of philosophy, which fill the greater part of Professor Powell's work, has already been carefully done by Frederick Trendelburg, especially in his "Uber Spinoza's Grundgedanken und dessen Erfolg," which he read in the Academy of Sciences, March, 1849. But the latter confines himself to pointing out the inconsistencies in Spinoza's system without atacking his personality.

Another volume which treats of religion but in a logical and constructive manner is *The Religious Conception of the World,* by Professor Rogers.[2] In the opening lines of his introduction the author tells us that he set out to defend a view of the world which is frankly religious and theistic, and thruout his volume Professor Rogers remains faithful to his promise. With grace and skill the author discusses the eternal problems of philosophy regarding the relation of God and nature, God and man, the purely metaphysical question concerning the nature of God. In plain language he tries to explain the greatest historical mystery, the permission of evil on the part of God. He also dwells at some length on the problems of freedom and immortality. Despite the abstract nature of the topics, the author uses simple language, careful-

ly avoiding the technical expressions of the philosophical schools.

In the chapter on "Religion and Philosophy," Professor Rogers endeavors to show that the relation of philosophy is a very close and natural one, especially if by religion is meant a belief in some reality which possesses unlimited power and regulates the destinies of our lives. He maintains everywhere that nationality and will or feeling supplement each other, nationality being the impulse to harmonize our experiences and in a very interesting and instructive manner he discusses the various causes which determine men to form different conceptions of God. He argues against the tendency of modern philosophical thinkers to ignore religion, rightly contending that, as religious consciousness forms part of our mental equipment, some sort of satisfaction must be accorded to it. On this basis he justifies the essence of Christianity, "the Fatherhood of God and brotherhood of man" as being adequate to the needs of human life. Professor Rogers maintains therefore that a view of the world, which is supported by deeply rooted sentiments, has a far greater claim to our recognition than any system logically worked out by any single thinker. In the next chapter "The Argument for Purpose" Professor Rogers furnishes additional evidence in favor of his "religious conception of the world." He reminds us here of the fact that most men endowed with a fair amount of intelligence and common sense are ready to admit that the design and management of the Universe guarantees the existence of a God to whom they feel related in some form, and in his attempt to interpret the purpose of the world, the author closely adheres to the theory of evolution. But he rejects the explanations of scientific materialism which he considers inconsistent just as that of naïve theology, as both prefer to impose human needs upon nature, rather than discovering what is there irrespective of any reference to ourselves and our natural tendencies. The only way to find it, according to Dr. Rogers, is to follow the process of the world's development from start to finish in a strictly logical manner. It becomes, therefore, necessary to understand the relation of intelligence to the process of growth that constitutes the universe. Now, substituting the term "God" for "intelligence," the question arises what is the connection between God and the changing world, or, rather, what is the relation between God and the world of material things which Professor Rogers discusses in the following chapter "The Relation of God and Nature." Here the author dwells on the Berkeleyan denial of the reality of the world as it appears to our senses and takes refuge in consciousness as the ultimate end. He favors this result because also the modern scientist's conception of the world is not in terms of matter but in terms of thought. This enables Dr. Rogers to trace our conscious experience to the same common origin, and he thus establishes the connection between the truth of nature and the truth of our secret and spiritual experience.

Professor Fullerton's *Introduction to Philosophy*[1] is a very useful book, and will be welcome to those who desire to become acquainted with the aim and scope of philosophy. It is to Professor Fullerton's credit that he frankly states in his preface (p. vi.):

> "Thruout it is taken for granted that the philosopher has no private system of weights and measures, but must reason as other men reason, and must prove his conclusions in the same sober way."

The introductory chapter on the "Meaning of Philosophy" is very interesting and instructive, but by no means exhaustive, and the student of philosophy will still derive great benefit from a perusal of Zeller's remarks in the introduction to his *"Geschichte der Griechischen Philosophie."* In the second part of his book Professor Fullerton discusses problems touching the external world. Particularly interesting are the chapters on "Space and Time," which prepare the reader for the study of the same topics in Aristotle and Kant. Four chapters relating to the "Problems of Mind" make up the third part of the volume. These will, to a certain extent, enable the student of philosophy fully to grasp the principal systems of modern philosophers since Descartes; also Realism, Idealism and their different shades

[1] An Introduction to Philosophy. By *George Stuart Fullerton*, Professor of Philosophy, in Columbia University, New York. 8vo, pp. 315. New York: The Macmillan Co. $1.60

are well explained. The book might be called "a condensed encyclopedia of the moral and mental sciences."

Problems of Public Health

THE development of scientific medicine has come in to help the solution of many social problems. We have before us a series of five books, not bearing much relation to one another, but all of them connected by the fact that they contain valuable information for those interested in social questions. Three of them are concerned particularly with the care of children, and these, of course, are of special interest to all social workers. Sir John Gorst, in his volume on the *Children of the Nation*,[1] states that his object is to bring home to the people of Great Britain the sense of the nature of neglecting the physical condition of the nation's children. He has treated such subjects as underfed children, overworked children, child workers in factories and mines, besides a number of medical questions. His chapter on overworked children, which shows that many of the school children in large cities are kept employed in various ways for many hours before and after school, and that some of them indeed have as a consequence of this not more than four or five hours' sleep at night, is a startling arraignment of the strenuous conditions of modern life. A large number of children were found who worked from sixty to eighty hours per week outside of school time. Almost needless to say, such children were dull in school and frequently went to sleep. With regard to underfed children, Sir John's statistics showed that conditions in London are, if possible, even worse than in New York, and that a considerable proportion of the children have very little breakfast before school and that many of them are distinctly underfed. In Yorkshire alone a list of three thousand children were reported to the Board of Guardians as not receiving sufficient nutrition. It is hard to think of civilization as advancing while conditions such as these exist among English-speaking people, but it is doubtful if England is any worse than our own large cities.

Dr. George Newman[2] has discussed the death rate among infants from the social standpoint. He shows that ignorance is largely at the root of the large infant mortalities in cities at the present time, tho a lack of interest and unwillingness to take trouble are also serious factors. How much serious conditions may be improved by very simple means is illustrated by the interesting experiment at Huddersfield two years ago. The mayor on being elected announced that he would give a prize of £1 to the mother of every child born during his mayoralty who produced it alive and well at the Town Hall at the end of his term. The infant death rate in the district sank during the year from 134 to 54 in a thousand. Much of this is attributed to the fact that a committee of ladies visited the mothers of all children born, to present them with the birthday card that each child had to have, on which was printed certain simple directions, and a visitor made it her business to take a personal interest in the child and the family all during the year. Here is one solution of the mortality problem. Another important factor is to be noted in the difference in mortality between English and foreign children. Less than half as many Irish and Italian children die, because their mothers nurse them much more commonly than do English mothers.

Dr. Clouston, in the *Hygiene of Mind*,[3] has considered the problems relating to the proper development of mentality and its conservation as these may be affected by education and environment. The author is himself a distinguished authority in mental diseases, and it was only to be expected, tho his preface makes but very modest claims, that he should treat all the possible harmful elements in early life from a thoroly practical and informing standpoint. His treatment of such questions as the Hygiene of Manners, Play, Work and Fatigue, the Hygiene of Childhood from birth to seven, of boy-

[1] THE CHILDREN OF THE NATION. How Their Health and Vigor Should Be Promoted by the State. *By the Honorable Sir John E. Gorst.* New York: E. P. Dutton & Co. $2.50.

[2] INFANT MORTALITY A SOCIAL PROBLEM. *By George Newman, M.D., D.P.H., F.R.S.E.* New York: E. P. Dutton & Co. $2.50.

[3] THE HYGIENE OF MIND. *By T. S. Clouston, M.D., F.R.S.E.* New York: E. P. Dutton & Co. $2.50.

hood and girlhood, from seven to fifteen and of adolescence from fifteen to twenty-five, are eminently suggestive. His treatment of the management of instincts is particularly good, and is supremely sane. The paragraphs on sex difficulties, on management of the moral sense and on the religious instinct contain precious hints from the standpoint of an experienced physician. He insists that religious training of the child is very important for character development and for future happiness.

The other two books before us are more distinctly medical and yet have their social interest. Dr. Childe[4] has written the most optimistic book on cancer that has perhaps ever come from a physician of experience without any ulterior motive. He insists that if cancer is only taken in time it is curable, but that the only cure is the knife. He sums up what he has to say in these words:

"A little knowledge, a little resolution, a little courage, these are the cures for cancer; the waiting and watching to see if it gets larger, or gives pain, or makes one feel ill, they are the messengers of death. Cancer wherever occurring in its early and only curable stage is a most insidious disease. You must not expect if you have it to feel ill, to suffer pain, to be losing strength and health. These are the signs that your time for cure is gone forever. Cancer itself is not incurable; it is only incurable if you make it so by delay."

Every physician and surgeon of experience will agree with Dr. Childe in this matter. More than one-third of those now operated upon at an early stage recover entirely from cancer. If people but came in time this number would rapidly rise to at least one-half. Most cancers are external and give due warning, but they must be seen to at once. Here is the medico-social lesson of a very significant popularly scientific book.

The number of volumes issued recently with regard to first aid to the injured show that the intelligent care of those injured is now considered to be a social duty imposing an obligation on practically every one of the community to know something about the measures necessary for relief in time of accident and sudden illness. Dr. Morrow's[5] book is sure to be helpful in this, because the subjects have been presented in simple non-technical language, and then the large number of illustrations makes the questions dealt with easy of comprehension by those even who know nothing of medical or surgical methods.

[4] THE CONTROL OF A SCIENTIFIC OR HOW CANCER IS CURABLE. By Charles F. Childe, B.A., F.R.C.S. New York: E. P. Dutton & Co. $2.50.

[5] THE IMMEDIATE CARE OF THE INJURED. By Albert S. Morrow, A.B., M.D. Philadelphia and London: W. B. Saunders Co. $4.50.

The Library of Home Economics. A complete home-study course on the new profession of home-making and art of right living; the practical application of the most recent advances in the arts and sciences to home and health. Prepared by teachers of recognized authority, for home-makers, mothers, teachers, physicians, nurses, dietitians, professional house managers, and all interested in home, health, economy and children. 12 vols., nearly 3,000 pp., 1,000 illustrations. Published by the American School of Home Economics, Chicago.

When the Greeks invented the word that has now become economy in our spelling, they meant by it the management of the house. An *oikonomos* was a housekeeper. Just how the secondary meaning of careful management that has now a hint of miserliness about it got into the word is, as Kipling would say, another story. Like domestic economy, "Home Economics" is tautological, but the epithet seems to be required by our present-day word notions. If there is tautology in the title, however, there is none so far as we could find in the twelve volumes of this library, which, so far as we can make out, contain practically everything that the really interested housekeeper would care to know about her house, inside and outside, and the health and happiness of those who dwell in it. The titles of the volumes are: 1—The House, its Plan, Decoration and Care; 2—Household Bacteriology; 3—Household Hygiene; 4—Chemistry of the Household; 5—Principles of Cookery; 6—Food and Dietetics; 7—Household Management; 8—Personal Hygiene; 9—Home Care of the Sick; 10—Textiles and Clothing; 11—Study of Child Life; 12—Care of Children. Each of these is written by an expert, or at least one possessed of special knowledge on the subject concerning which he or she writes, for as is very proper under the circumstances, more than half of the contributors are

women. The volumes are handy and are well illustrated and contain an immense amount of information. Things that it must take an old housekeeper years of experience to learn, the young housekeeper may have here under her hand at the very beginning of her régime. The library is destined to find a place in many homes.

Literary Notes

....Any of the books reviewed in this or previous issues may be ordered from THE INDEPENDENT. It is sometimes a convenience to our readers in writing to THE INDEPENDENT or renewing subscriptions to include the price of books they want to buy.

....*All the Year in the Garden* is not, as it might appear from the title, a manual of gardening, but a compilation of quotations from the poets, one for each day of the year. The many excellent quotations and good photographs make it a suitable gift-book for birthdays and like anniversaries. (New York: Crowell & Co. $1.00.)

....The partner of the late Marshall Field, Mr. Harlow N. Higinbotham, has written a book for young men in business, *The Making of a Merchant.* (Chicago: Forbes & Co. $1.50.) We are certain no great merchant was ever "made" by reading books about success. Yet sound, practical advice may help the forceful, ambitious boy to avoid making some mistakes, and may contain hints by which even the born commercial genius may profit.

....If a man should be elected to the Presidency, or appointed Chief Justice, suddenly, he might find instruction as to his new social duties in *Social Usages at Washington.* (By Florence Howe Hall, Harpers, $1.00.) It is a matter of gratification that we are "free from a ceremonial code," yet the burden of custom apparently lies heavily upon the Washington conscience, and orders of precedence at state dinners assume an importance which seems ludicrous to outsiders. Yet, if such customs do exist, it is well enough to have them printed as a guide to official etiquet.

....Two Chinese texts, *T'ai Shang Kan Ying P'ien* and *Yin Chi Wen,* have been rendered into English by the joint efforts of Teitaro Suzuki and Dr. Paul Carus, and brought out by the Open Court Publishing Co. The first of the tracts mentioned, which is the more important of the two, is accompanied with the original Chinese text and the verbatim translation in English facing it. They are scholarly and useful translations; still it is easy to find flaws. In that portion of the text to which the translators of the present book give the title of "Moral Injunctions," the translators render the clauses in the imperative mood. "Moral Injunctions" is a misnomer; these clauses are descriptive of "The Good Man." The translators give the title of "A Description of Evil Doers" to the second half of the text; and they are right in so doing. It is true that there are two clauses, beginning with the character numbered 188, "Worms and insects, herbs and trees, even they must not be injured; by all means grieve at the misfortunes of men, etc.," which are put in the imperative form in the original Chinese. No doubt this it was that led the translators to put the rest in the same mood. But this is not at all an uncommon way the classic writers of China have of giving a certain emphasis to a clause; and in this case the context does not authorize putting all the rest of the adjective clauses in the form of injunctions. Moreover, may it not be possible that some of the characters be rendered a little more happily. For example, the translators render "*Tien Tao*" as Heaven's Reason. Why not simply say "Heaven"? By the "Heaven-Way" (which is the literal translation of *Tien Tao*) the Chinese writer means that supreme Entity of the Universe, the God of the Christian expect that the Heaven-Way is impersonal; it is the "Nature," the "Over-soul." Instead of "Heaven's Reason gives them grace," it ought to be rendered, "Heaven helps him."

Pebbles

THERE isn't much hope for the person who can become interested in watching others play cards.—*Atchison Globe.*

"I UNDERSTAND that she is quite a musical genius."

"Yes, she plays the Pianola with her peek-a-boo shirtwaists."—*Cornell Widow.*

"WHAT have you got in the shape of cucumbers this mornin?" asked the customer of the new grocery clerk.

"Nothing but bananas, ma'am."—*Everybody's.*

REVERSED.

SAID Phœbe Snow, who had to go
Upon a trip to Buffalo,
"If we are wrecked by some neglect
It will be just what I expect."
—*Princeton Tiger.*

SEASONABLE ADVICE.

Now, this is all I have to say—
Keep 'em on.
To early spring fall not a prey,
Keep 'em on.
Think not because mild breezes blow
That we are done with sleet and snow;
It's quite a jump to June, you know—
Keep 'em on.

Let others foolish be, but you
Keep 'em on.
No matter what your neighbors do,
Keep 'em on.
I need not come right out, I ween,
For surely you are not that green,
I take it you know what I mean,
So keep 'em on.
—*Louisville Courier-Journal.*

Editorials

The Harriman Controversy

MR. HARRIMAN says that President Roosevelt sent for him about a week before the election of 1904 and asked him to raise money for the campaign in New York; that he did raise $200,000; that the President agreed to make Senator Depew Ambassador to France, if this should be "found necessary"; and that, after the election, the President, saying "he did not think it necessary," broke what Mr. Harriman regarded as a promise. The President says that Mr. Harriman's assertion is "a deliberate and wilful untruth." He supports his position by documentary evidence and argument. We have examined with care the arguments and the testimony in this controversy, and we accept the President's denial. That is to say, we believe that the main charge of Mr. Harriman is false. It is admitted, however, that he raised the money and paid it into the campaign fund ($50,000 of it being his own contribution); that he conferred with the President, at the latter's request, concerning the difficulties of the political situation in New York; and that his relations with the President in those days were those of cordial and even confidential intimacy.

That the President and Mr. Harriman were then associated in this way is shown by the correspondence. Here we must express regret that in his summary of the correspondence Mr. Roosevelt omitted his letter of June 29th, in which he said: "As soon as you come home I shall want to see you. It has been a real pleasure to see you this year." This was the invitation. Reference to it was made in the first sentence of Mr. Harriman's reply of September 20th. This sentence (as well as the letter of June 29th) the President omitted in his statement, thus giving support to Mr. Harriman's assertion that his purpose was "to convey the impression that the personal interview with him in the fall of 1904 was of my seeking and not his." Altho the omission does not, necessarily, in our opinion, affect the main question, it was one that should not have been made. Mr. Harriman promptly took advantage of it.

We might take up the essential parts of the testimony and consider the bearing of them upon the issue of veracity, but we accept the President's version of what took place at the interview preceding the election, and there are certain aspects of the controversy, apart from the question whether the President asked Mr. Harriman to procure the money, that deserve to be considered.

Our columns have shown our support of Mr. Roosevelt's policies and our recognition of his devotion to the public interest with respect to the great questions of the time. But we cannot think that the record of this controversy with Mr. Harriman is wholly creditable to him. Altho the official investigation of the so-called Harriman railways had not then taken place, Mr. Harriman was not then regarded as a person of ideal excellence. One would scarcely have expected to see Mr. Roosevelt sending for him and conferring with him about his Messages. It was quite well understood that Mr. Harriman was the representative of capitalistic interests and groups with which the President was not in sympathy.

Three weeks before the election the President invited him to come "a few weeks hence, before I write my message, to discuss certain Government matters not connected with the campaign." Mr. Harriman expected something for his money, altho, as we believe, nothing had been promised. It was natural that, after the election, he should urge the President to say nothing in his Message about railroads, and natural that he should resent the rejection of his advice on this subject. Again, Mr. Roosevelt was familiar with the political character of Governor Odell, whose ardent supporter Mr. Harriman was. We regret that the President sought Mr. Harriman's advice and aid, altho it does not appear that his course or his official utterances were affected by that advice. And when the President was informed by Congressman Sherman that in 1906,

after the disclosures of the life insurance investigation, he had asked Mr. Harriman for a contribution to the campaign fund, it seems to us that the President should have rebuked him for doing so. That application to Mr. Harriman for money, and the latter's response to it, opened the controversy which came before the public last week.

This whole affair relates to the use of money in elections, and to the payment of large sums into party campaign funds by capitalists and corporations. We should have preferred to believe that President Roosevelt could not be induced to have anything to do with such contributions. But in statements recently given out at the White House by authority, the contributions of corporations to the fund in 1904 have been discussed. It is pointed out that the contributions of some were rejected because they might have provoked scandal. There is no evidence that there has been payment in any form to those whose offerings were accepted. We know, of course, that President Roosevelt would not permit payment to be made. Indeed, it is quite probable that some contributing corporations have since been prosecuted under his direction. But it should not be possible for question to arise in the public mind as to the granting of favors, by immunity or otherwise, to those who have contributed, or as to the punishment, by prosecution or otherwise, of those who have refused to pay.

This controversy with Harriman affords an example of the conditions under which punishment for refusal is suggested to hostile partisan critics. At least two prominent newspapers have been saying that the investigation of the Harriman railroads by the Government was begun after Mr. Harriman refused Congressman Sherman's application for a contribution and at about the time when the President's letter to Congressman Sherman, with its denunciation of Mr. Harriman, was written. We do not believe that the investigation was related in any way whatever to Mr. Harriman's reply when Mr. Sherman asked him for money, but some persons have been led to believe that the relation was that of cause and effect. That it should be possible for any intelligent person to entertain such a belief is something to be deplored.

There should be complete publicity for campaign funds, and corporations should be forbidden by law to contribute. The names of those who give should be officially made known, with the sum which each one pays. Every detail of expenditure should be made public in sworn statements. If anything were needed to prove how desirable and necessary such publicity is, it is supplied by the history of this controversy with Mr. Harriman. In his next Message to Congress, President Roosevelt should most earnestly ask for the legislation by which full publicity can be assured.

A Better Orthography

One year's work of the friends of a simplified spelling has been celebrated the past week, and they have found much to encourage them. It has been a better year for the cause than any other since Noah Webster published the first edition of his famous dictionary. That dictionary was notable chiefly for its reformed spellings. The conservatives, whom we have ever with us, would have continued to throw back the rule to the penultimate authority of Walker, or the antepenultimate of Johnson, but the people would have none of it, and they agreed to go forward with Webster, except that they would not accept his *bridegoom* for *bridegroom*. It was then, as ever, that the lexicographers led the way. The remarkable thing now, which puts dismay in the conservative ranks, is the fact that all the men who have authority on words in England or America are with the reformed spelling. More than any others they understand how fluid our spelling has been, and how desirable it is that spelling should follow and indicate the history of pronunciation.

The meeting was the most important ever held to consider this subject. The leaders in the movement came from Great Britain and from California. Their conclusions were in full accord with those of the members of the Board and its Executive Committee who have been responsible for its work during the year. Mr. Carnegie and Prof. Brander Mathews and President Jordan and the British

scholars agreed to carry on the assault against the castle of prejudice on the lines thus far adopted. There was no such disagreement as has been imagined by some of the reporters in the press, and the action taken in the election of Professor Lounsbury to succeed Professor Mathews as president was exactly what the latter had months before urged.

It is not the purpose of the Simplified Spelling Board to press an immediate radical revolution in the direction of complete phonetic spelling. Of course, the phonetic spellers are all in favor of this present movement, because half a loaf, or even a crumb or two, is better than no bread. So doubtless most of those who accept these three hundred words wish they might persuade the English world to renounce all the follies of our antiquated orthography. We plainly declare that such is our desire, and that we take these three hundred words, most of which are already adopted in the United States, as a foretaste of the orthographic millennium. But full accomplishment is not yet in sight. By and by the English-speaking world will unite to create the reform. Then the objections will vanish into thin air, portentous as they now look to fearsome souls. Meanwhile these few, inconsiderable changes give us simply the principle. They are so few and small that one will hardly discover them in a page of reading. The reader of this editorial will find it hard to discover a single one. The assertion that it will be necessary to print new editions of the entire English literature so that it may be read is the merest moonshine.

For some years the Simplified Spelling Board will continue to go very slowly. It will add no new reforms this year, or, maybe, the next. It will be satisfied to let time accustom slow people to what is good. But it will be necessary in the end to take other steps forward. Our spelling must, for our children's sake, come down to clear phonetic rules. The present cruelties must come to an end. The Emperor of Germany has directed the shorter spellings to be adopted in his country, and all the German publishers accept his word. Our President is as earnest in the matter as is William, but he has no big stick. Congress can resist him, and he cannot, as does the German Emperor, dissolve Congress at his will and be assured of a subservient succession. Our people have to be educated, just as the readers of THE INDEPENDENT are already educated. And the process will go on.

Nitrogen and Felicity

THE human race has encountered many perils since it started out a quarter of a million years ago, more or less, upon its career. Jack London has told us about some of the earlier ones, as he remembers them; and Mr. MacKaye tells us this week about the most recent one which, it seems, we are just grazing by. There was a pretty fair prospect, it appears, that by the year 1931 the supply of fixt nitrogen in the soil of our earthly heritage would be so far exhausted that our posterity would be compelled to take somewhat hastily to mansions in the skies. But the scientific man, with that benevolent forethought which so nobly distinguishes him, has been looking into the matter in that quiet, practical way that he has, and has discovered two or three promising methods of obtaining all the fixt nitrogen we shall need from the exhaustless supplies of free nitrogen in the atmosphere. So that little difficulty is provided against.

But *cui bono?* New perils loom on the horizon. What is the use of creating endless food supplies for an ever-increasing population, if all it amounts to in the end is to cause "two unhappy human beings to live where only one would have lived before"? The mankind of today appears to be just a bit daft on the subject of production, and it is not giving adequate attention to the problems of distribution and consumption. Its philosophy seems to be that of the late Mr. Horace Greeley, as amplified and corrected by the up-to-date hustler, "Go West, young man, and buy land, to raise corn, to fat hogs, to make money, to buy more land, to raise more corn, to fat more hogs." This philosophy undoubtedly leaves something to be desired.

Mr. MacKaye, as we have remarked about him before, is an unterrified Malthusian. The neo-political economists have not convinced him that the Rev. Thomas Robert was so fat-witted as the

modern social theorists would have us believe. He stands pat on the proposition, that population tends to run up against the preventive checks of misery unless the prudential checks are brought to bear. So he admonishes us to use the new supplies of free nitrogen for increasing the rate of wealth consumption per capita rather than the mere number of human beings.

Now it is not a new discovery that doctors sometimes disagree, and the fact is worth noting right here that certain distinguished scientific gentlemen have been concerned of late lest the human race, following too eagerly the advice of Mr. Malthus, should fall upon disaster quite as decisive as universal famine. The eminent French statisticians, Levasseur and Dumont, raised the note of warning as far back as the eighties and now we hear it echoed in England and in the United States. Professor Cattell, for example, has been publishing articles in *The Popular Science Monthly,* showing how rapidly the older American stock of mainly English blood, and especially the stock of educated, cultivated folk, is breeding out. The figures which these articles have set forth are convincing evidence that the restriction of the birth rate has been taken up in good earnest by just that element of our population which is on all accounts most desirable, while the coarser fibred, more ignorant elements continue to increase as heretofore.

Clearly there is a problem here quite as vital as that of the proper distribution of wealth. It is obvious that we need a better distribution of race suicide. It is idle to deny that heredity, while still imperfectly understood, is a fact quite as effective in the evolution of civilization as environment is. Particular qualities are transmitted, and if the stock in which those qualities inhere breeds out, the qualities themselves are gone forever, as surely as are the characteristics of those species of plants and animals that occupied the earth in earlier geological times.

Here, then, is a really momentous interest for the practical scientific mind to grapple with. It is true that the human race should henceforward, as Mr. MacKaye contends, look more to quality and less to quantity of life. But it is not less true that this purpose will fail of achievement if the birth rate restriction is practiced too exclusively by the quality.

Pittsburg and Carnegie

It has been a great week for the ever youthful Andrew Carnegie, one of the greatest weeks in his life. It takes a strong man to endure such a strain. But the assurance that one is accomplishing so much is enough to rejuvenate age. There was the Simplified Spelling Board, financed by him, with its international meetings and its big dinner. Scarce anything that Mr. Carnegie has done has attracted so much attention, for we must all spell to write. Then there was the meeting of the National Civic Federation, with another big dinner at Mr. Carnegie's house which brought millionaires and workmen about the same table. Then came the letter of Mr. Carnegie's, with his additional gift of six million dollars to the Carnegie Institute. In large giving Mr. Carnegie finds his greatest pleasure. The dedication of the Institute comes this week, with international features. This new gift brings the total amount given by Mr. Carnegie to his home city to twenty-three million dollars. Of this sum eight millions form the endowment of the Institute. The gifts for the creation and endowment of the Institute form the largest sum of money ever presented by a single individual to an educational institution.

While Mr. Carnegie is a Scotchman by birth, and now a resident in New York, when not alternating with his Skibo Castle, he regards Pittsburg as his home city, for it was there that he spent most of his life, and there that he accumulated his wealth. The great Library which he has founded there, and the Institute of Technology connected with it, their magnificent buildings, and their generous endowment, are a noble monument of a spirit which is always noble, that which wishes to benefit the place of one's residence. Because Mr. Carnegie's wealth came thru the arts of manufacture it is natural that he should give his beneficence this direction. He, therefore, funds a great school which will

teach the methods of the handicrafts, which are the source of both comfort and wealth.

For two things is our country distinguished, for its teaching of liberty and for its inventions and manufactures. If we are to keep our pre-eminence in industry it must be by developing industrial education in all its highest technical ways. Such industry it is which has given its pre-eminence to Pittsburg, and that pre-eminence is to be maintained not simply by its store of coal, but by such education as this Institute will provide, drawing to it those who will be the captains of its industry and of the industry of the country. The Greater Pittsburg will be greater than its past, not because it adds Allegheny City to its territory, but because it possesses and fosters such an Institute of technologic learning and skill as that which celebrates its creation this week.

In his letter of gift Mr. Carnegie distinctly puts "the technical schools first in practical importance." There are other departments connected with the Institute, the Art Department, the Museum, the Music School, and the Librarians' School, but the modern, up-to-date technical schools he cares most for. It is the common people that he is concerned with, and so he wants foundrymen and miners to be able to give their sons the best education for practical use. Even in art he does not want "old masters" sought for, but the work of new masters who will "become 'old masters' in time," for the gallery, he says, "is for the masses of the people primarily, not for the educated few," and such are the technical schools, not for millionaires' sons, but out of them will come the future millionaires. But still better, out of them will come the skill, which creates prosperity and comfort, and wealth for the people at large.

A Constitution for the Union of Nations

A MEETING in the interest of international peace of the greatest importance will be held in this city next week. It will express, we trust, the practical desires of the wisest men in all sections of society for the substitution of law for war. The world waits for such an agreement and union of the nations as shall eliminate war as a method of settling international disputes. But that means an organic union of nations for legislative, judicial and executive action.

To many persons who have not given the subject careful thought, the idea of a union of nations seems visionary and impractical. To those who have faced the facts as they exist today, it is apparent that this union already exists.

An eminent French Senator, in meeting the argument made by some of his associates that a union of all Europe is impracticable, has declared clearly and unanswerably the fact that the railroads and the telegraph lines have already created a union of Europe; and it simply remains for wideawake people to recognize this fact and act accordingly. He might, with equal truth, have said: "The railroads and telegraph systems have created a union of all nations commercially."

No one can deny this manifest fact, but when we speak of the constitution of a union of the nations, the thought of a *political* body and constitution come to mind, rather than a commercial body and constitution.

Even when we have in mind a political body and constitution, the fact remains that a political union of all nations is already formed and its constitution is very interesting. It has all the departments of government, judiciary, legislative and executive, but none of them in perfection.

Take, for example, the judiciary department: There are about a hundred men who are today members of the International Court of The Hague. The Constitution of the Union of the Nations provides that each one of the twenty-six nations that took part in the First Hague Conference may appoint four persons as members of this International Court. There would be a hundred and four International Judges if each of these nations had appointed its full number. The United States has appointed four of its most distinguished citizens as International Judges.

The International Judiciary has no authority to try any question, unless the two contending parties voluntarily come before the Court and request that they hear the evidence and render judgment according as they may find the facts and the law.

The International Court, therefore, has

no jurisdiction. It can act only upon the initiative of *both* of the parties to a controversy. A properly constituted Court must have a sphere in which it can act on its own motion or at the request of one whose rights are alleged to have been violated. The fact, however, that the judiciary department of the International Union is defective, does not alter the fact that this department of the International Government actually exists.

Not only has the union of the nations a court, but it has a large body of law which has been built up during many centuries, and passes under the name of the law of nations. This body of rules or principles is so large that a thoro understanding of it is impossible for a citizen engaged in the ordinary affairs of life, and yet this body of law is not as complete as it should be, and there is no modern method of altering or adding to this law. It can be amended only by unanimous consent.

The law of nations applies over the whole world: but the court which has been established to administer this law covers all the world except South and Central America. The only International Congress that has been established covers only that area of the world which is *not* included in the territory represented on the International Court with the exception of two nations. The United States of America and the United States of Mexico are represented both in the International Court, whose seat is at The Hague, and in the Pan-American Union, whose seat is at Washington city, the sessions of this Congress being held first at one and then at another American capital.

Until 1906 there was no provision in the international constitution for the periodic assembling of this International Congress, but at the third Pan-American Congress, held at Rio Janeiro last summer, the constitution of the Union of American Nations was amended so as to provide for the periodic assembling of this Congress.

Tho the Union of Nations is constituted, its constitution is manifestly imperfect, and three desirable improvements seem to be: First, the International Court ought to be established thruout the whole world, by the appointment of members upon this tribunal by every nation, and by the definition of an area within which this court will have jurisdiction, so that it can become an integral self-acting part of the world's judicial machinery. Second, an official International Congress to supplement this court should be created to assemble periodically, in which all the nations will be represented. Third, it seems desirable that the Interparliamentary Union be established as soon as possible in all parliaments where it has now no representatives, and that this organization be recognized and permanently established as a part of the world's official legislative machinery.

The reader will find on another page a tentative draft for such a constitution for the union of the nations of the world. We are not so confident of our wisdom as to imagine that when such a constitution is framed it will not be very much more carefully elaborated. Our sole purpose is to open the subject and present certain points that need consideration and review. But we do feel impressed with the importance of making definite and acknowledged and effective what is now rudimentary and imperfect in the implicit but not yet explicit constitution of the world's three departments of government. What we have drawn up in a formal way may at least be a suggestion to the experienced statesmen who will have the final word.

The Chicago Election

For the first time in a great American city the Chicago election last week turned on the question of municipal ownership of the traction systems. The result was delay, not rejection. The people decided, by both referendum and by the election of a Mayor, that they so far believe in public ownership of the city lines of traffic that they will take time for careful consideration.

It is a pity that in local elections we have to align under the names of the national parties. Mayor Dunne, Democrat, was candidate for re-election. Two years ago he received nearly 25,000 plurality; this year the Republican candidate, Mr. Busse, has 13,000 plurality over him. But, while 10,000 voters on the Socialist ticket two years ago swung over this year

to Mayor Dunne, 13,500 remained loyal to their ticket, and their vote—and they all of them favor city ownership—if it had been cast for Mayor Dunne would have elected him. It is then no great victory for the Republican candidate on the chief local issue.

Doubtless the corporate interests were on the side of Mr. Busse, but with them also were a vast number of citizens who had an open mind, and are not yet convinced that the city is ready to make the purchase of the traction lines, even if the debt limit should allow. The roads had come to be in a very bad condition, and uncertainty of the issue had prevented repairs. Now the bill vetoed by Mayor Dunne, but submitted to the people and approved, will provide for immediate extensions and improvements, with a limited term of franchise, and the right of the city to purchase the property on a six months' notice and at a reasonable valuation. Meanwhile, 55 per cent. of the net profits will go to the city. There is thus no action against public ownership; indeed, it may be furthered by this delay.

It is not at all improbable that the extravagant attitude of Mr. Hearst's newspapers gave great offense and even injured their cause. Nevertheless, it is not to be allowed that his papers published in Chicago, or he himself with all his energy, tho his home is elsewhere, had not the right to do their utmost for the cause which they sincerely believe to be right, and which we believe is sure in the end to prevail. There is no more bad taint of "socialism" about the city ownership of street car lines than there is in the ownership of the streets themselves or of the public schools. Governments which are the least of all socialistic own and manage their railroads, and we in America are moving in that direction.

The Philosophic Scaffold

In an address at a symposium held not long ago in New York by the Drew Theological Seminary Club, Dr. Patton, of Princeton Theological Seminary spoke in part as follows:

"The difficulty with most men is their inability to tell where they stand—if they do stand. They need to orient themselves. If they knew where the East was they could probably locate the other points of the compass. One is asked so often why more students in the universities do not come forward to enter the ministry. I answer plainly, I do not know. I could name at least half a dozen who came to college with the intention of becoming preachers, but before the end of their course had concluded that other fields were better for their energies.

"One reason for this defection is that the present intellectual unrest weighs with terrific force on the minds and consciences of young men.

"They are not ready to give assent to all that is required in the Church of their choice. With their attitude unsettled on philosophic questions, they do not see their way clear to enter the ministry. I tell you a tremendous amount of responsibility just now rests on the men who hold the chairs of philosophy in the colleges of this land. If their pupils are allowed to take hold of purely materialistic doctrines and cling to them, they cannot become ministers of Jesus Christ unless they be hypocrites."

Dr. Patton seems to be right. When the Reformation reached Cologne work was stopped on its cathedral, but the scaffolding was left untouched. Time and its ravages destroyed plank after plank, upright after upright, so that when work was resumed some seventy years ago new scaffolds were needed. It is the same with Theology, propped around by Philosophy and finished off in structural Creeds.

Today, not indeed under stress of wars or revolution or heresy or schism, but from the advancement of humanity, the Churches require some new scaffolding if they will retain their hold on the mind and heart of the twentieth century. When Luther, Calvin, Zwingli, Beza and the other Reformers stepped forth out of the old Church they carried along their philosophic training and harnessed the New Light to the chariot of Aristotle. They could not shake off their philosophic training. Orthodox Protestantism has its doctrines surrounded by a Peripatetic scaffolding, just as the Roman Church has.

Old men may call on mankind to hark back to Aristotle. In vain; the hands of time never turn backwards, nor does the march of humanity. Hegel and Kant, Comte and Spencer, Nietsche and Schopenhauer, Darwin and Wallace, Martineau and Caird, Ladd and James, Giddings and Wilfrid Ward, open up new vistas, which no Church can ignore.

When Cardinal Newman, in his "Grammar of Assent," taught that Revelation can only be accepted as the outcome of a "congeries of probabilities," he dealt a hard blow at the philosophy of the Roman Church, which is trying to shake it off by condemning Loisy's "The Gospel and the Church," a work built upon Newman's theory.

The new philosophy will make sad wrecks in many creeds. Theology, in other words, will be recast in the thought of modern life and science. At present, owing chiefly to psychology, biology and the embryonic science of sociology, our philosophic notions seem to be in solution. Some day they will be crystallized and thrown into shape. Then must theology take on a dress acceptable to the new methods.

Like law, like government, like philosophy, like science, creeds are the outgrowth of men's endeavors. Man is manifold. To look at him from the standpoint of another life is religion; to regard him from the standpoint of this life is science, with its many divisions. Man is the Alpha and Omega in both views. Religion, following the current philosophic notions of the day, synchronized into creeds. Orthodox Protestantism and Catholicism differ in dogmas, but not in the philosophy underlying their respective doctrines. Since philosophy is changing, why not a new scaffolding for theology? The halt comes from the superstitions stereotyped in our minds. We fear lest we may undo the past. We are alarmed lest we may fail to find in theology and the Church the continuity ahead admitted in government, morals, science. Again, we are in dread that the future will lop off our morals from the creeds. But the study of folk lore and primitive customs has brought home that morality antedates creeds. In fact, the ethics taught in the Catholic Church, as well as the Protestant, are Aristotle's. Sir Leslie Stephens, a professed agnostic, when writing in his "Science of Ethics" on the contents of the moral law, could not break away from the cardinal virtues as given by Aristotle. Now that humanity is adapting itself to all the results of science and mastering its every phase, it seems but true and honest that the churches should adjust their creeds also. The hue and cry of Catholics and Protestants will be the same: "Christianity is gone! Christ is forgotten! Catholics raised such outbursts at the Reformation, Lutherans during the War of the Peasants, Anglicans during the Protectorate; all Europe at the French Revolution. How wrongly! Today mankind are better and nobler than ever in the past.

The real danger of the churches today is that, neglecting to adapt their creeds and government to the progress of mankind, they will lose the masses and come to stand in their eyes as the police of governments. How often in our land do we hear that the churches are the bulwark of society, the upholder of government? And the masses understand it very well. For the great movements of humanity, social reform, trades unionism and in Europe even disarmament, meet much opposition from churches and church lights.

Conservatism is good, aye, needful; but mossbackism is harmful. An old rabbinical legend tells us that on Sinai, in order to safeguard the law, the Almighty demanded hostages of Moses. The Jewish leader first offered the Patriarchs, whom Jehovah refused; next the Prophets, who were also unacceptable. Then the great lawgiver presented the children, who proved worthy in the sight of the Most High. Patriarch and prophet typify the past; the child stands for the future. Like the former, creeds stand for the past, while the children are the human race, its science, its longings, its future. A creed must never be a *rocher de bronze*. As a whole, mankind are honest, and, we may reverently add, religious. Creeds must fit mankind; not mankind be squeezed into creeds.

The Duma and the Czar

Indications multiply that the present Duma, careful as it is wiser and more prudent than the former, will be violently dissolved. If so, it will not be the fault of the Duma. It will be by the intolerable, arbitrary act of the Ducal cabal which rules the feeble, irresponsible Czar. He, it is reported, is tired of rule and would be glad to abdicate. Never was

it more true that uneasy rests the head that wears the crown. There can hardly be a more miserable man living. The humblest peasant is happier than he. If Russia might only have a strong, liberal Czar, there would be hope for Russia. But now the Czar will be told to dissolve the Duma, and he will obey, and a period of fresh disorder will follow. When the entire body of the people are stamped upon, peasants as well as workers in the factories, when farm and city are united in hating the rule over them, then terrible revenges are sure to come. Then revolution is justifiable, and when revolution is crushed by the power which possesses the rapid-fire guns, the people, who have the right to rule, may be expected to use what means of resistance and revenge they have. We fear, if the Duma is dissolved, as we expect, that the members will go home to disseminate the spirit of secret resistance and assassination. There will be not a little cutting off the heads of the tallest poppies. What we have seen will be nothing to what will come, for the leaders of the people will not submit to being mercilessly overborne by force. It is a terrible pity that a nation should be forced to carry on such a war, but we see no likely alternative. Thousands will die, and not in battle, for liberty.

Visitors Personally Conducted

What is called a "junketing party," or any announced committee of officials, have no chance to see things just as they are, for those in charge will always clean things up for inspection. It is the man who appears unannounced and unexpected that gets the everyday view. Accordingly we put some weight on the report of Congressman Rainey, of Illinois, who has spent eight days looking about at Panama "on his own hook." He went everywhere, ate in the dining halls at their everyday menu, and examined the work done. He says the digging is proceeding excellently, and that the medical supervision is beyond criticism. But he criticises the commissary department, says the meat supplied is bad, because there are no refrigerating cars to take the meat from the shop to its destination. He says that the Congressional delegation lately in the Isthmus were told that the meals given them were the same as given to the employees at 30 cents, when in reality they cost $1.65 a head. He says there is certainly grafting in the Isthmus; that shoes are sold at $8 a pair that can be bought at home for $3. It will be replied to Congressman Rainey's detailed criticism that he is a Democrat and only a single witness against a whole party of Congressmen and against visitors of even more exalted rank; and he may be counted with Poultney Bigelow. But his way is the right way to get the facts, and his generally favorable report is very encouraging, for there have been fears that the work of excavation might take decades.

The Anglo-Celtic

Why do we speak of the Anglo-Saxon world, of the Anglo-Saxon speech or peoples? It is only England that is predominantly Anglo-Saxon, and even that is hardly true. Scotland, Wales, Ireland are predominantly, almost entirely, Celtic, and when we speak of the people of Great Britain and of the larger English-speaking world, we ought to think and speak of them not as Anglo-Saxons, but as Anglo-Celts. The basis of our American population is Anglo-Celtic. From the beginning the Scotch and the Irish and the Welsh have settled here, as well as the English. Their descendants have a pride in their ancestry. They do not like to be called Anglo-Saxons, when they are not. They may consent to the word *British* for their cousins who still live in Great Britain, but they are not English, except as their common tongue has taken the name from England, where it originated. But their blood did not originate, like their tongue, in England. It came from Celts. Since the most unfortunate ill-will between England and Ireland, the Irish-born, the world over, are constantly objecting to being classed as Anglo-Saxons, and they are right. It would be much more proper to drop the term Anglo-Saxon, in its ordinary use, and substitute for it *Anglo-Celtic.*

Another World Congress

There are few men in the United States more closely in touch with things in general than President Butler of Columbia University. His speech,

therefore, last Friday night, at Mr. Carnegie's reception to the National Civic Federation, in which he suggested that President Roosevelt call together a great congress of the nations to discuss economic and labor questions is highly significant. Indeed, it is not too much to assume that President Butler would not have stood sponsor for such a proposition unless it were agreeable to the administration at Washington. It is to be hoped that such a conference will be called, and that the United States will be the one to call it, for there is no other problem before the world of equal importance to this economic one, unless it be that of international peace. But as this is one that excites the most intense controversy between the classes in every nation of Christendom, we shall hardly find much unanimity of opinion in regard to any solutions that may be proposed at an international Congress or elsewhere. Still, the National Civic Federation (which never does small things) and President Butler are to be thanked for this great proposition.

Those who have been called upon to make an accounting for their management of Mrs. Eddy's property seem to have fled to cover, for Mrs. Eddy has, they tell us, put all her property, except her home, in the hands of three trustees for the use of the Church. The claim was, however, that Mrs. Eddy was not mentally competent to manage her estate, and that others were doing this irresponsibly and to the injury of her natural heirs. If that was and is so then this act of her giving her property to trustees is also invalid, and we can hardly expect that those who have brought the suit for an accounting will consent to substitute the three trustees for the defendants previously named. The defendants and these new trustees seem to fear to have Mrs. Eddy appear before a court which shall decide as to her mental and physical condition.

The American way of lynching does not seem to go down in East Africa, where at Nairobe Englishmen undertook to flog some negroes charged with insulting white women. They actually found out who were the "best citizens" engaged in this administration of lawless justice, and the president of the Colonists' Association and two other prominent colonists were sentenced to a fine and a term of imprisonment. We are not surprised to hear that the whites are very indignant over the sentences. Why not? Must it be understood that laws are meant to protect natives also? Ex-Governor Northen says that courts do not protect them in Georgia.

Now that certain physicians in England have said that alcohol is useful in medicine and not bad as a moderate beverage, there comes a flood of testimony the other way. One distinguished French physician says that next to pulmonary consumption, wines and spirits cause more deaths in the Paris hospitals than any single disease. Among the English leaders in medicine, Sir William Gull, Sir Henry Thompson and Sir Benjamin Ward Richardson will not allow that alcohol is of any use whether as medicine or drink.

All that the general public was allowed by the omniscient press to learn about the meeting last week of the American Oriental Society at Philadelphia was what concerned the "sniff kiss." That sounded sensational—a "feature" could be made of it. So the public was informed how the ancient Hindus rubbed noses, and "sniffed" and "smelt" each other before they had learned the true civilized kiss. Thus the weighty discussions were past by, and a sensation was made of a paper which really had nothing sensational in it.

Prof. Lindley M. Keasby, of the University of Texas, wants a new science of civilization, and in *The Popular Science Monthly* he proposes the name *civology*. It is a miserable mongrel word, half Latin and half Greek, and misspelt at that. It never ought to get into a dictionary.

If, as reported, Senator Allison will follow Senator Spooner and retire from the Senate in 1909, the loss will not be easily made up, either to the State of Iowa or to the country at large.

Insurance

Borrowing on Life Policies

Editor Insurance Department, New York Independent:

DEAR SIR—As a reader of THE INDEPENDENT, I take the liberty to address a letter of inquiry to you. Is it advisable to borrow on existing insurance policies—to take out new ones, meeting the premiums every year with new loans on the old policies?

To be more specific—I have a policy dated June 22d, 1900, in the Germania, of New York, for $2,000, called a Dividend Tontine Life Policy, with limited payments, with a twenty-year period to run. Furthermore, my wife has an Equitable policy dated March 29th, 1902, called a Guaranteed Cash Value Policy Limited Payment Life, twenty-year period, for $1,000.

An agent of a reputable old line company has been trying to persuade us to borrow on these policies and take out new insurance with him, and thus doubling the amount of insurance, or at least increasing it without additional expense, simply making loans on the old policies for the yearly premiums.

He assures me that three-fifths of the policy-holders do that, but it seems to me much like taking money from one pocket and putting it into another.

The agent has had me examined and has the policies ready for me.

Now, what would you say about such a plan? It is entirely new to me. What are its advantages and disadvantages from the standpoint of the policy-holder?

Thanking you beforehand,

I am, yours truly,

A. E. V.

To borrow on your policies the amount available as a loan value for the purpose of paying the premium on a new policy would be to make a very serious mistake. A man should borrow on his life insurance only in case of urgent need and as a last resort. The day that he makes the loan he decreases the protection of his insurance policy by just that amount. At the same time he increases his future payments by the amount of the interest, which he must meet annually. The loan privilege may prove of extreme value as a means of keeping the policy in force in a possible contingency when the premium can be met in no other way. If the man borrows on his insurance to the extent of its loan value for any other purpose, he may presently find himself unable to pay both premium and interest, and as he can borrow nothing further, his insurance will in consequence be sacrificed. These considerations make it the hight of folly to borrow the loan value of your existing policies for the purpose of taking additional insurance as outlined in your letter. If you need more insurance and have not the ready cash with which to pay the premium, borrow on anything else, but not on your old policies, which have been running some years, and which you cannot afford to sacrifice under any circumstances.

The statement of the agent, which you quote, "That you can double the amount of insurance or at least increase it without additional expense," is misleading and palpably false. Your present expenses will be increased by exactly the amount of the new premium, which you must pay, whether you obtain that premium from your bank deposit or borrow it by mortgage of your home or your present policies. In the end you will find that you have not doubled your insurance, for the amount of your loan must be deducted, and ultimately you will have to pay the yearly premiums on all of your policies plus the interest on your loan. The statement of the agent that three-fifths of the policy-holders take the course suggested is absolutely without foundation. Nothing like one-fifth or even one-tenth of existing policy-holders in any company have borrowed upon their policies, even for all purposes combined. The number who have borrowed for the purpose suggested would be extremely small and limited to the few who have been misled by agents seeking to make a commission for themselves without due regard for the interests of the insured.

Insurance Against Dog Bites

IOWA now comes to the front with a bill giving a novel twist to the insurance principle. The bill in question has passed both Houses, and provides for the taxation of all dogs in the various counties and the placing of such resulting funds in a special county fund, out of which the supervisors shall award damages to all persons whose domestic animals shall have been injured from attacks by vicious dogs, provided such injuries are not the result of an attack by a dog belonging to the owner of the injured animal. Claims in excess of $10 are to be passed upon by the board of supervisors and oral testimony is to be taken. Claims under $10 will be allowed upon the affidavit of the owner of the injured animal.

Financial

New York's Canal Bonds

Bids for the $5,000,000 canal improvement 3 per cent. bonds offered last week by the State of New York amounted to only $300,000. The bidders for this small part of the issue were willing to pay nothing above the par value. Under the law, bids below par could not be accepted. Having awarded the $300,000, the State bought the remaining $4,700,000 at par with money of the sinking fund. A bid that could not be considered was that of A. L. Judson for the entire issue at 101.6325, conditioned upon the enactment of a pending bill exempting from the State tax of 1 per cent. upon the surplus and undivided profits of savings banks any amount which such banks invest in State bonds. The failure of the attempt to market these canal bonds caused no surprise. State bonds at 3 per cent. cannot be sold at par. New York City 4 per cents. are quoted at only a shade above par. On the day before the award of these canal bonds, the Erie Railroad Company borrowed $5,500,000 on short-term notes (to refund 6 per cent. notes soon to mature), and paid more than 7 per cent. for the money. These notes have been offered to investors at a price yielding about 7½ per cent. Within the coming nine months $118,000,000 of short-terms notes of railroad companies and other large corporations will mature. The stated rate for some of these is 6 per cent.; for about half of the total it is 5 per cent. It is unfortunate that the State of New York, in attempting to market bonds for the important canal improvements upon which $101,000,000 is to be expended, is restricted to par bids at 3 per cent. There is danger that work upon the improvements will be interrupted in the near future, when purchases with money from the sinking fund can no longer be made.

....The Steel Corporation has decided to expend $6,000,000 upon a new plant of furnaces and steel mills at Duluth.

....The bid of the Cape Cod Construction Company, $11,990,000, for the construction of the projected ship canal across Cape Cod, has been accepted. The bidding company is composed of August Belmont, William Barclay Parsons, John B. McDonald, De Witt C. Flanagan and others. It will begin work next summer.

....Charles M. Schwab, president of the Bethlehem Steel Corporation, says that this company will take no more shipbuilding contracts from the national Government. It is now building three warships at its plants on the coast. Money is lost on such contracts, he says, owing to "a succession of delays caused by governmental red tape."

....The Kings County Trust Company, of Brooklyn, publishes a handsome pamphlet entitled "The Evolution of the Trust Company," in which information is clearly given as to the development of such companies, their banking powers, the supervision of them by the State, and their usefulness as trustes of estates. The president of this company is Julian D. Fairchild. Its capital is $500,000, and its surplus and undivided profits amount to $1,610,125.

....Reno J. Clark, who entered the employ of the Fourth Street National Bank of Philadelphia in 1890, has been appointed cashier. The new assistant is William Alexander Bulkley, who has been connected with the bank for nineteen years. The other officers are R. H. Rushton, president; E. F. Shanbacker, first vice-president, and B. M. Faires, second vice-president. The Fourth Street National Bank has a capital of $3,000,000; its surplus and profits amount to $5,400,000.

....The Union Pacific system is taking measures to increase its efficiency and to ascertain the needs of shippers along its lines with the view of meeting shipping requirements. To this end, J. C. Stubbs, the traffic director of the system, has just spent about three months on a personal inspection tour thru the territory served by his roads, meeting the people personally and acquainting himself with existing conditions on the Harriman lines. Reforms of various kinds will be instituted as the need for them is shown to exist.

The Independent

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Politics

No additional reports concerning the plans said to have been made by reactionaries in the Republican party for the defeat of Mr. Roosevelt's policies and any representative of them have come from the White House, but detailed accounts of the dinner at which it is alleged that Senator Penrose told the story have been published in papers that earnestly support the President. It is asserted that all of the Senators who were present (Mr. Penrose excepted) have given the President a report of what was said. By some, the recent attack upon the President and his policies by the new Mayor of Philadelphia, ex-Congressman Reyburn, is ascribed to the influence of Senator Penrose. In a recent public utterance of H. H. Rogers, of the Standard Oil Company, predicting a change of public sentiment to a preference for conservatism in the conduct of the Government, some of the President's friends see evidence of the reactionaries' designs. Canvasses made thruout the country by prominent newspapers show that the President's popularity has not decreased. Following the publication of the report about a plot of the reactionaries, resolutions in his favor were adopted in the Legislatures of several States. The Pennsylvania House unanimously commended his course with respect to legislation and "denounced any combinations of corporate wealth with politicians of any party intended to reverse and defeat the policies of justice which the President has so wisely and fearlessly inaugurated." The resolutions of the Minnesota House (only four Democratic members dissenting) demanded his nomination and re-election. Senator La Follette remarked that the people were entitled to another term of Mr. Roosevelt, and that no one else could "fill the bill." Congressman Longworth, the President's son-in-law, said that he desired the nomination of Secretary Taft because the latter was best fitted to complete what the President had begun. Several Senators called at the White House, their subsequent statements indicating that they had sought certificates of loyalty. One of these was Senator Scott, who asked that it be made known that he stood "with the President." A day or two later, at his home in West Virginia, he asserted that Secretary Taft was not and would not be a candidate, and also called for conservatism. "We have been very radical in our legislation," said he, "and business interests demand a return to conservatism in the Republican party. We should nominate a conservative." In several papers reports were published that Secretary Root would soon retire from the Cabinet, owing partly, it was asserted, to his disapproval of the President's action concerning the Harriman correspondence.——At a banquet given to Mr. Bryan in Chattanooga on the 10th, John Temple Graves, editor of an Atlanta paper and a well known political orator, urged that the Democrats in their national convention should "pay tribute to the great and typical American who has proved himself the dauntless and conquering captain of the people's cause," and that Mr. Bryan, speaking for

a pure Democracy and for the whole plain people, should "put in nomination Theodore Roosevelt for one more undisputed term of power to finish the work he has so gloriously begun." Mr. Bryan commended Mr. Graves for his honesty and boldness. "As at present advised," he continued, "I shall not present the name of Mr. Roosevelt to the National Democratic Convention. Bear in mind that I say, 'As at present advised.'" On the following day he asked: "Why should we not have an all-Democratic President instead of one who is a Democrat only half the time?" Senator Culberson, addressing the Texas Legislature on the 10th, praised Mr. Bryan, but condemned his doctrine concerning Government ownership of railroads as paternalistic, impractical and undemocratic. Speaking at a Jefferson dinner in New York on the 13th, Senator Rayner said he regarded such ownership as a vision and a phantom. He did not believe the Democratic platform "would contain any provision holding out the hope of such an undertaking." At the same dinner Col. George Harvey, editor of *Harper's Weekly* and of the *North American Review*, applied to the President many uncomplimentary adjectives in an address for which, he said, he had taken the following text from Ecclesiastes:

"Woe to thee, O land, when thy King is a child. The beginning of the words of his mouth is foolishness, and the end of his talk is mischievous madness."

——Senator Foraker opened his campaign on the 10th, in Canton, with a long speech, the greater part of which was a defense of his opposition to the President with respect to the Railway Rate bill and the dismissal of the negro soldiers. He denied the right of any one except his constituents to call him to account. "I will not submit," said he, "to the dictation or threats or menaces of any kind of a boss, big or little, inside the State or out of it."

The Oil Trust Found Guilty

The first trial of the Government's charges against the Standard Oil Company for unlawfully accepting rebates or secret discriminating rates from railroads ended, in Chicago, on the 13th, in a verdict of guilty. The jury was out only three hours and took only one ballot. Judge K. M. Landis presided at the trial, which consumed six weeks. District Attorney Sims and Assistant District Attorneys Wilkerson and Parkin were the prosecutors. On 1,463 counts the defendant company is found guilty. As the minimum penalty provided by law is $1,000 and the maximum is $20,000, the court may impose a fine ranging from $1,463,000 to $29,260,000. A motion for a new trial is pending. The indictment related to the acceptance of rates on the Alton road, between Whiting, Ind., and St. Louis, which were lower than the published rates by about 65 per cent. Other indictments, involving several thousand counts and relating to similar practices in the company's dealings with other railroads, are pending in half a dozen States. Owing to the similarity of conditions, this verdict probably foreshadows the action of other trial juries. These prosecutions grew out of the Garfield report.——In the suit of the Government against the same company, about forty of its subsidiary corporations, John D. Rockefeller, Henry H. Rogers, Henry M. Flagler and others, for violation of the Sherman Anti-Trust law, and also for unlawful practices concerning railroad rates, the defendants have filed an elaborate answer and their exceptions. In this answer all the charges are denied, and among them is the one which was sustained by the verdict of the jury at Chicago on the 13th.——At St. Paul, the Great Northern Railroad Company has been found guilty of granting rebates and been fined $15,000. In a similar case, at Minneapolis, the Chicago, St. Paul, Minneapolis & Omaha road, with its freight agent, H. M. Pearce, was found guilty last week. At Syracuse, the jury disagreed in a suit charging the New York Central with granting rebates to the General Electric Company.——The officers and corporations of the Furniture Trust, who were recently indicted at Chicago for violation of the Sherman act, have admitted the justice of the accusation. F. A. Holbrook, the head of the combination, has entered a plea of guilty, and the plea of thirteen of the fourteen indicted corporations is virtually equivalent to his. This Trust controlled the greater

part of the trade in school desks, church pews and other church furniture. It was prosecuted on account of complaints made by many pastors and school boards. ——Last summer's attacks upon ice dealers are occasionally recalled by the conviction of persons indicted then. In Columbus, Ohio, a few days ago, the managers of two ice companies, found guilty of conspiracy in restraint of trade, were fined $1,000 each. In Omaha, S. E. Howell, president of the Coal Exchange, has been sentenced to pay $1,000 and to serve six months in jail.

A Plan for Cuban Elections

Secretary Taft spent four busy days in Cuba. He listened to the recommendations of the political parties and of prominent citizens representing various interests. On the 10th, in a statement addressed to Governor Magoon, he reported the disagreeing views of those who had conferred with him, and then set forth his recommendations. These views for the most part related to the preliminary and final elections and the dates when they should be held. Before stating his conclusions he said it was hardly necessary to reiterate that President Roosevelt's attitude had undergone no change, the President still holding "that Cuba must be turned over to a Cuban Government, fairly elected, so soon as the conditions of tranquillity in the country will permit and the stability of the Government shall be assured." A census must be taken, he continued, and four months would not be enough for that. It would be unwise to fix a definite date for a preliminary election. The census must be thoro, fair and complete for electoral purposes. The municipal and provincial elections should be held "within such period, after the completion of the census, as may afford a reasonable time for complying with all the requirements of the new electoral law." Three months, he thought, might not be sufficient time for testing the questions of tranquillity and of the success of the experimental preliminary elections. For this reason, "our declaration should not be more limited than that the national election shall be held within six months after the preliminary election." There should be compliance with the constitutional requirement regarding an interval of 100 days between the national election and the voting by the Electoral College. Then, with the assembling of Congress and the inauguration of the new President, the Government would devolve upon the newly elected officers and legislators. The substance of this statement, he added, had been approved by President Roosevelt. "The carrying out of this plan," said he in conclusion, "is strictly dependent, of course, upon the tranquillity of the country, which must continue thru two elections, and which must give assurance of the stability of the new Government; because without this the United States would not be discharging the obligation devolving upon it by reason of the intervention." Dispatches from Havana say that the plan thus outlined by the Secretary is satisfactory to all political parties. Estimates of the time required for completing a census range from four to eight months.——The Supreme Court at Washington has decided, in a tariff case, that the Isle of Pines does not belong to the United States.

Prosecution of Land Thieves

Coal lands said to be worth millions of dollars are to be returned to the Government by the Union Pacific Railroad Company and a coal mining company which this railroad company controls. These lands, which are situated in Wyoming and Colorado, were wrongfully acquired by the railroad company. The Government's suits against the two corporations in relation to other coal lands alleged to have been acquired by fraud are soon to be tried in Utah.——At Cheyenne, Wyo., E. M. Holbrook, president of the Wyoming Coal Mining Company, and E. T. McCarthy have been indicted by a Federal grand jury for conspiracy to obtain public land by fraud. Both are said to be millionaires.——The Government will sue the Southern Pacific Railroad Company to recover large tracts of mineral land in Nevada alleged to have been tak-

en fraudulently. —— Bartlett Richards and several others were recently prosecuted to conviction in Omaha by the Government for taking public land by fraud. Sentences have been imposed as follows: Bartlett Richards and William G. Comstock each $1,500 fine and one year in jail; Charles C. Jameson and Aquilla Triplett, $800 each and eight months in jail. Richards, a millionaire, is president of the Nebraska Land and Feeding Company, and Comstock is vice-president. The stealing of about 200,000 acres was involved. With these men were associated in the original indictment Thomas M. Huntington, Frederick Hoyt and Ami B. Dodd, who are now on trial in a separate proceeding, the charge being that they robbed the Government of large tracts of land by perjury and forgery.

Surrender of the Honduran Army

The forces of Honduras and Salvador, besieged at Amapala, surrendered unconditionally on the 12th, and President Bonilla (of Honduras) took refuge on the American cruiser "Chicago." President Zelaya demanded that Bonilla should leave Central America for a permanent residence abroad. The "Chicago" will carry him to some port of Mexico or the United States. Terms of capitulation were arranged by Captain Doyle, of the "Chicago," but much credit for what seem to be successful negotiations for peace is due to Philip Brown, Secretary of the American Legation in Honduras, who has been acting as the representative of Salvador, and has completed plans for a conference of President Zelaya with President Figuera, of Salvador. It is reported at Washington that a conference of representatives of the five republics will soon be held at Washington or Mexico City, to make an agreement for permanent peace. President Zelaya is grateful, he says, to the Washington Government for its efforts to restore peace, and is anxious that peace shall continue for a long time. Many think, however, that it is his aim to consolidate the five republics and to rule over them. It is asserted that, with this end in view, revolutions will be fomented in Salvador under the leadership of Dr. Alfaro, and in Guatemala under the direction of General Toledo. Both of these men have been political exiles. It is said that ex-President Barillas, another exile, had been selected to lead the movement in Guatemala. He was assassinated a few days ago in Mexico.—— Ceiba was captured on the 3d and Puerto Cortez on the 5th. The soldiers of Honduras quietly withdrew and resumed work on the banana plantations where they had been employed as laborers. Marines from American ships assumed control, closed all the saloons and patrolled the streets. Commander Fullam, of the "Marietta," in a letter to the Nicaragua leader, General Estrada, forbade the bombardment of Honduran ports. He said:

"If bombardments of coast towns are to be resorted to during the frequent wars and revolutions in Central American States, the mercantile interests of all foreigners will be absolutely insecure in the future. From this it is plainly evident that assurances regarding the safety of American and foreign interests would be of no value whatever unless bombardments of these unfortified wooden towns are forbidden; and it is equally plain that a ship of war ordered here to protect American interests could not be excused for subjecting these same interests to inevitable ruin by permitting the destruction of these towns by fire and bombardment. Fully three-fourths of the valuable mercantile and business houses in these coast towns are owned by foreigners. Neither of the belligerents will be permitted to occupy or to take cover in these houses during the course of hostilities. I trust that I may not be compelled to inform the United States Government that I am mistaken regarding the attitude of Nicaraguan forces toward foreign business interests on this coast, and I hope that you will avoid all danger of complications by giving directions that property shall not be subjected to destruction by fire and bombardment."

He also warned the Honduran generals that in defending any one of these towns they must take a position outside of the city. Lee Christmas, the American general in the Honduran army, who is said to have been cut to pieces, was formerly a locomotive engineer in Mississippi, where his reckless conduct caused several railway collisions. Among the Nicaraguan officers are four or five Americans. One of these generals, formerly a civil engineer, is said to have applied recently to an American consul for a loan, because he was receiving only two dollars a day.

The Carnegie Institute

On April 12th Andrew Carnegie formally opened and gave to the city of Pittsburg the Institute which he has founded at the expense of $23,000,000. A procession, composed of the faculties of the technological schools, the board of trustees and the forty-five distinguished European guests whom Mr. Carnegie had invited at his expense to assist in the dedication of the building and to attend the New York Peace Congress, marched from the hotel to the Institute between the lines composed of the 1,400 male students of the schools and backed by 25,000 people. Mr. Carnegie departed from his set speech in expressing informally his personal feeling in regard to his beneficences in the following language:

"My banker tells me that I have so many bonds; I never even saw them. Did I earn them? Well, I started the machinery going and they came to me. When the Institute project was first mentioned I wrote my name to a little slip of paper. That completed my task. I do not even know how many bonds they took, because I don't know how many I have. And still I get the credit. It does not belong to me. I told my wife last night, after I had viewed this wonderful place, that I felt that Aladdin's lamp had been working, and she replied: 'Yes, and you did not even have to rub the lamp.' That sizes up my position exactly."

In his address to the large audience assembled in the Institute Mr. Carnegie followed the same line of thought that he developed in his "Gospel of Wealth," in this language:

"In after days when the founder becomes merely a name, as Harvard and Yale and Cornell and many founders are today, the future Pittsburg millionaire, loyal to the city where he has prospered, will see that his bequests be best bestowed upon needed extensions or new departments or institutions collateral to this one, now unthought of. It will become more and more the fashion, may I not say the duty, of Pittsburgers to consider what return they can make to the city which has done so much for them.

"Wealth will be less prized for itself in future generations, and the chief aim will be to bestow it wisely, and, I might add, justly, for surely the city where wealth is made has, after the family, first claim.

"There is room for many things of the spirit in our city. Things material are abundant. Our mills and factories are numerous, large and prosperous, but things material, including money itself, should only be the foundation upon which is reared things spiritual. Our mines of coal and iron have not completed their mission when transmuted into dollars. Not until the dollars are transmuted into service for others has wealth completely justified its existence. Dollars are only dross until spiritualized, a means to an end, and miserable is the man, mean and squalid his life, who knows no better than to deaden his soul by mere possession, counting over the hoard which holds him down or using his faculties in old age in augmenting the useless stuff which ministers not to any taste worthy of man.

"Little does and little can the speculator on the exchange or the mere dollar grabber in any line of activity know of the higher pleasures of human existence. Only when a man labors for the general good and for other than miserable aims that end with self can he know and enjoy the high spiritual rewards of life.

"Many are the men and women in Pittsburg who are laborers in the vineyards of self-abnegation. The highest type of humanity is that which does most to make our earthly home a heaven. The highest worship of God is service to man."

American Delegates to The Hague

It is announced from Washington that the American delegation at The Hague Peace Conference will consist of the following persons: Joseph H. Choate, former Ambassador to Great Britain; General Horace Porter, former Ambassador to France; U. M. Rose, of Arkansas, former president of the American Bar Association and now president of the Arkansas Bar Association; David Jayne Hill, American Minister to the Netherlands and former professor of international law at Rochester University; Brigadier-General George B. Davis, Judge Advocate, United States Army and formerly professor of international law at the United States Military Academy; Rear Admiral Charles S. Sperry, United States Navy, president of the Naval War College; William I. Buchanan, formerly Minister to Argentine Republic and to Panama, and chairman of the American delegation to the Rio conference. Secretary, Chandler Hale, of Maine, formerly secretary at the American embassy at Vienna, and the son of Senator Hale, of Maine; expert in international law, James Brown Scott, Solicitor of the Department of State; expert attaché, Charles Henry Butler, reporter of the United States Supreme Court. The delegates will sail from New York for The Hague about the middle of May.

The Montagnini Papers

The Paris papers continue to publish extracts from the papers of Mgr. Montagnini seized by the Government at the Papal Nunciature. Most of the letters contain nothing but gossip of a personal and trivial character, not at all to the credit of Secretary Montagnini as a diplomat. In one of his letters to Cardinal Merry del Val he relates a conversation with Dr. van Steurs, Minister of the Netherlands, in which the latter "expressed deep regret at the course of politico-religious events in France, which is falling deeper and deeper into the hands of Freemasonry, which would lead it to ruin or to barbarous revolution." Dr. van Stuers has denied the statements. Premier Clemenceau has met the charge that he could be purchased by alleging that M. Piou, from whom Mgr. Montagnini got that idea, was trying to obtain money from the Vatican for his own purposes under the pretense of bribing the Premier. M. Clemenceau says that he met M. Piou at the house of "an American woman, one of my friends and one of the glories of our modern school of painting" (Miss Cassatt), but that in the conversation over their coffee nothing was said about winning him over. A letter of especial interest to Americans as bearing on the Roosevelt-Storer controversy is that written by Mgr. Montagnini to Cardinal Merry del Val, the Papal Secretary of State, January 6th, 1905, in which he says:

"I take advantage of this occasion to inform you that General Porter, the Ambassador of the United States, having manifested the intention of retiring, influence is being brought to bear on President Roosevelt to induce him to go back on the promise he made about three years ago to Mr. Storer, now American Ambassador in Vienna, an excellent Catholic, of the Paris post. Mr. Roosevelt is being made to believe that at the present moment a Catholic Ambassador to Paris would be impossible. Mr. Roosevelt, who is, after all, a free thinker, believing that he will thus be more agreeable to M. Delcassé, is said to be disposed to accept the suggestion of his Secretary—namely, the appointment to Paris of Mr. Meyer, the Ambassador to the Quirinal, who does not know French and is of Jewish origin. I happen to know that some one will take steps to influence M. Delcassé, and eventually the President of the Republic, in favor of Mr. Storer, all the more as this fact shows us, as it does foreigners, the speculations of this Government on anti-Clerical policy."

The Abbé Jouin, in the prosecution of whom the Montagnini papers have been employed, was found guilty of incitement to riot by pulpit utterances at the time of the church inventories, and was fined 16 francs.

The Russian Situation

The chief incident of the parliamentary struggle in Russia during the past week has been the exchange of letters between the President of the Duma and the Premier in regard to the rights of the Duma. The Famine Committee of the Duma requested to be allowed access to the statistics of the zemstvos, or provincial assemblies, but this was refused. The Constitutional Democrats carried their motion to refer the budget proposals of the Government to a committee for examination instead of rejecting them, as the Socialists demanded. But when the budget committee called in financial experts not connected with the Duma or with the bureaucracy to aid them in their study of the budget, Premier Stolypin notified the President of the Duma that no private persons would be allowed to enter the Duma. President Golovin protested against this, but in vain. The Premier placed guards at the entrance of the Tauride Palace, with orders to exclude every one except Deputies. President Golovin thereupon broke off correspondence on the subject, informing the Premier that he was not able to meet the argument of force to which the Premier had resorted. The Premier, in a private letter to the President, suggested that the committee could consult with experts in some private house. President Golovin enforced his authority against Mr. Purishkevitch, the anti-Semite Deputy from Kishineff, by having him excluded from the hall for insulting the President. Mr. Purishkevitch had called upon all the members of the Duma to rise as a mark of respect for the persons murdered by the revolutionists, and the President had declared the proposal out of order. M. Purishkevitch then shouted: "You're not President of the Duma, but of the Left."

The Belgium Cabinet Crisis

The Belgian Cabinet of which Count Smet de Naeyer was Premier has been forced to resign on account of the defeat of the Government on the mining bill. King Leopold has returned to Brussels from the Riviera, to which he had retired, either from pique or ill health. The desire of the Government in regard to the mining law was that the hours of labor should be fixed by royal decree, but the Socialists in the Chamber of Deputies made a strong fight for retaining the power in the hands of the representatives of the people, and the Chamber voted an amendment, by 94 to 32, fixing the hours of labor. The Premier then announced the resignation of the Cabinet, and the following day a royal decree was presented signed by the King and Ministers withdrawing the bill from the consideration of the House. The Government has the right to withdraw a bill before its adoption by the Senate, but the action in this case has aroused bitter resentment among the Deputies, particularly because the decree of withdrawal is dated before the vote was taken upon the question and yet not presented until after the Ministers resigned. M. Janson, the leader of the Progressives, declares it is an extraordinary piece of insolence. M. Bertrand, the Socialist, says:

"We are on the road to a terrible crisis in which the King will suffer. The Kongo is at the bottom of it all. It remains for the King to conform to the national will or abdicate."

It is generally agreed that if the Cabinet had not fallen on this question it would when the Kongo matter came before the Chamber, because here the King and his people are in irreconcilable opposition. About three months ago the Belgian Chamber refused to recognize the right claimed by King Leopold to impose arbitrary conditions upon the annexation of the Kongo Free State to Belgium. A committee was appointed to examine the question and report upon the plan for annexation during the lifetime of the King. The King, however, refused to have anything to do with the committee and very little progress has been made toward agreeing upon a colonial system.

Lord Cromer's Rule in Egypt

Lord Cromer, who has been for twenty-four years the benevolent autocrat of Egypt, has resigned his position on account of failing health. This concludes what is probably the greatest administrative accomplishment of modern times, for, in spite of the racial and religious antipathies and dissensions of the people, he effected the regeneration of a bankrupt and enslaved country, altho he had no established position and little formal authority and had to work with the representatives of fourteen other European Powers, all envious of the growing power of England in Egypt. Yet, by his tact, perseverance and industry he has made England admittedly supreme and Egypt prosperous. Taxation has been reduced, the immemorial oppression of the fellahin by tax gatherers has been abolished, and the revenues have increased from $45,000,000 to $60,000,000. The value of the imports has doubled and the production of cotton, the principal export, has also doubled. If the great dam at Assuan be raised to 19½ feet, as is now proposed, 1,000,000 more acres of land will be brought under cultivation and the cotton output increased by some $20,000,000 annually. Evelyn Baring, now Lord Cromer, is the tenth son of the late Henry Baring, M. P., who was the third son of the first Sir Francis Baring. He entered the Royal Artillery, and attained the rank of major when, in 1880, he was appointed Financial Minister of the Council of India. There his success was so great that in 1883 he was sent to Egypt as "British Diplomatic Agent and Consul-General," which has been his nominal position ever since. He kept at his post in spite of all efforts at advancement, even refusing a position in the Cabinet, and he has always been willing to subordinate himself by giving full credit to European and native officials who worked with him. His success is largely due to his having been given a free hand by the home Government and to his policy of pushing forward young men into positions of responsibility and inspiring them with his own spirit. He was raised to the peerage in 1892 and created an earl in 1901. He is succeeded by Sir Eldon Gorst, who has been trained

by him in the Egyptian service and is now Under Assistant Secretary of State for Foreign Affairs.

Lord Cromer's Report

Just before his resignation Lord Cromer issued his annual report for 1896 "on the finances, administration and condition of Egypt and the Sudan," which is of special importance on account of his frank discussion of the present situation and his recommendations for the reform of the administration. Egyptian Nationalism, of which the outside world has heard so much, is, in his opinion, a novel and exotic idea, for the Egyptians have been under foreign rulers ever since the times of the Pharaohs. The following quotations from his report will give his view of the relations between Nationalism and the Pan-Islamic movement:

"The difficulty of dealing with this subject is moreover, enormously enhanced by the fact that but few Egyptians have, in political or administrative affairs, a very clear idea of what they themselves want, while the practice of advocating two separate programs which are mutually destructive of each other, is the rule rather than the exception. I have frequently had expressed to me by Egyptians—among whom I am glad to be able to count many personal friends who speak to me very frankly—a paradoxical desire to secure all the advantages of the British occupation, which they fully recognize, without the occupation itself. I have had a leading Egyptian urge me to employ fewer Europeans in the Government service, and, in the same breath, ask me to arrange that a lawsuit in which he was interested should be tried by a British judge. I have known a warm advocate of Egyptian rights plead earnestly for the appointment of a British rather than an Egyptian engineer to superintend the distribution of water in his own province.

"Pan-Islamism is generally held to mean a combination of all the Moslems thruout the world to defy and to resist the Christian Powers. Viewed in this aspect, the movement certainly requires to be carefully watched by all European nations who have political interests in the East. It may possibly lead to sporadic outbursts of fanaticism in different parts of the world. We were within a very measurable distance of such an outburst in Egypt last spring. I see it constantly stated that the 'unrest' to which allusion was made in the House of Commons last summer was imaginary. I am wholly unable to concur in this view. The temperament of the lower classes of the Egyptian population, and notably of the urban population, is eminently mercurial. They were suddenly lashed into a fury by the inflammatory and mendacious writings in the Pan-Islamic press and they subsided into comparative tranquillity with almost equal suddenness when the British garrison was increased, and when the writers in the vernacular press, under pressure exerted on them by the more intelligent of their own countrymen, moderated their tone.

"Pan-Islamism is, moreover, a convenient phrase for conveying a number of other ideas, more or less connected with its primary signification. For the purpose of my present argument these are of greater practical importance than the wider definition to which I have alluded above.

"In the first place, it means, in Egypt, more or less complete subserviency to the Sultan.

"In the second place, Pan-Islamism almost necessarily connotes a recrudescence of racial and religious animosity. Many of its adherents are, I do not doubt, inspired by genuine religious fervor. Others, again, whether from indifference verging on agnosticism, or from political and opportunist motives, or—as I trust may sometimes be the case—from having really assimilated modern ideas on the subject of religious toleration, would be willing, were such a course possible, to separate the political from the religious, and even possibly from the racial issues. If such are their wishes and intentions I entertain very little doubt that they will find them impossible of execution. Unless they can convince the Moslem masses of their militant Islamism, they will fail to arrest their attention or to attract their sympathy.

In the third place, Pan-Islamism almost necessarily connotes an attempt to regenerate Islam on Islamic lines—in other words, to revivify and stereotype in the twentieth century the principles laid down, more than a thousand years ago, for the guidance of a primitive society. Those principles involve a recognition of slavery, laws regulating the relations of the sexes which clash with modern ideas, and, which is perhaps more important than all, that crystallization of the civil, criminal and canonical law into one immutable whole, which has so largely contributed to arrest the progress of those countries whose populations have embraced the Moslem faith."

Lord Cromer considers the ambition of the Egyptian National party for a native Parliament similar to the British House of Commons and having complete control over the finances of the country an absurdity which would lead to national bankruptcy and chaos:

"Can any sane man believe that a country which has for centuries past been exposed to the worst forms of misgovernment at the hands of its rulers, from Pharaohs to Pashas, and in which, but ten years ago, only 9.5 per cent. of the men and .3 per cent. of the women could read and write, is capable of suddenly springing into a position which will enable it to exercise full rights of autonomy with advantage to itself and to others interested in its welfare?"

Tearing Down Prosperity

BY WASHINGTON GLADDEN, D. D., LL.D.

Author of "Social Facts and Forces," "Applied Christianity," "The Practice of Immortality," Etc.

"Why should stock values be lower today than they were a year ago? I can only account for it by the attacks which have been made upon corporate interests during the past year or two years—unwarranted attacks that go to tear down the structures that have been reared by our people thru great effort, energy and patience."

THESE words are attributed by a reporter to the richest man in the world. It is never quite fair to hold any man responsible for anything that he is reported in the newspapers as saying, and the personality of this speaker will not therefore be taken into account; but inasmuch as a complaint similar to this frequently finds utterance in these days, it may be well to give it some attention.

Is it true that the depression in certain classes of securities is due to unwarranted attacks which have been made upon the corporations issuing them? I must doubt whether unwarranted attacks would be likely to inflict much injury on such organizations. The American people have shown themselves unwilling to lend an ear to accusations against the large corporations. Indeed they have been slow to give heed to attacks which were clearly not unwarranted, which were supported by evidence of the most indubitable and overwhelming nature. Nothing is more notable than the indifference which has been manifested by the public at large, during the last ten or fifteen years, to the attempts which have been made to bring before them facts of the most startling character concerning the management of some of these great enterprises. The public mind has shown itself to be the reverse of inflammable or explosive in its attitude toward these matters. Until the managers of the great insurance companies insisted on exposing their own rottenness to the public, it was well-nigh impossible to make the mass of our people believe that a great aggregation of capital could do anything wrong.

Since that they have begun to open their eyes. But it is not by unwarranted attacks that they have been awakened, tho, of course, those whose iniquity has been exposed are inclined to say so. The insurance directors and officers themselves have insisted that all the accusations against them are baseless and malevolent. The people of the country are, however, by this time, fully convinced that not only the three big insurance companies but a large number of other great aggregations of capital, including the railroads, have been conducting their business in a manner not only unlawful but grievously unjust and injurious. The people have been convinced of this, not merely nor mainly by articles in the newspapers and magazines, nor by sermons or speeches, but by judicial investigations in the courts. The charges made by writers of books and by contributors to periodicals have finally been taken up by prosecuting officers, and have been found to contain so large a measure of truth that indictments have been brought, in the courts of the United States and of several of the States, covering many thousand cases of violations of the criminal laws. Some of these cases have been tried and the accused persons have been convicted and heavily fined. In one of these cases, against one of our greatest railway corporations, the Federal Judge, George C. Holt, a man of high character and distinction, said, in pronouncing the sentence, that the evidence of guilt was "clear, conclusive and undisputed," and that the crime was one which "in its na-

ture" was "deliberate and premeditated," and he added:

"Such a violation of law, in my opinion, in its essential nature is a very much more heinous act than the ordinary, common, vulgar crimes which come before the criminal courts constantly for punishment, and which arise from sudden passion or temptation. The crime in this case was committed by men of education and of large business experience, whose standing in the community was such that they might have been expected to set an example of obedience to law, upon the maintenance of which alone in this country the security of their property depends."

Now it is the simple truth, which all fairly intelligent Americans perfectly well know, that this kind of conduct has been practised all over this land by the railroads and the big corporations who have been confederate with them; and the people are demanding that the men who have been engaged in such illegal and injurious conduct shall be brought to justice. For this demand the people have found a commanding voice. It is the voice of the President of the United States, and of his Attorney-General, and of the entire Federal Department of Justice. It is the voice of the State of Missouri and its Attorney-General, and of the State of Ohio and its Attorney-General, and of high officials of other sovereign States—the voice of the highest officers of our Government charged with the enforcement of the laws. By these authoritative voices the machinery of government has been set in motion, and the result, up to date, is the securing of indictments by grand juries specifying, as I have said, thousands of criminal acts on the part of the railways and the big shippers and the managers of great monopolies. Many of these indictments are still pending, but most of the cases that have been tried have resulted in prompt convictions, and in the imposition of fines amounting to hundreds of thousands of dollars.

Such is the action which one of the accused persons now describes as an "unwarranted attack." It strikes me that the phrase is rather inaccurate at this stage of the proceedings.

The purpose of these "unwarranted attacks" is, according to this authority, "to tear down the structures which have been reared by our people thru great effort, energy and patience." I must be allowed to doubt again whether any purpose exists, in this country, on the part of the masses of the people to tear down any structure which has been reared by honest industry and lawful enterprise. There are, no doubt, a few embittered and malignant agitators who are full of enmity toward all who are more prosperous than themselves, and who would be glad to see all the well to do reduced to penury. But this class of persons is small. They exert no controlling influence. The great majority of our American people have no enmity toward persons of wealth as such and they do not wish to weaken the safeguards of honest property. To accuse them of a purpose to "tear down" the structures which enterprise and frugality and patience have toiled to rear is grievously to malign them. There is no populace on the earth whose sense of justice is more quick and keen than our own. The American people believe in fair play and the square deal for everybody, rich and poor, and no wild-eyed destructionist, whose only motive is envy or malice, will ever lead them very far.

But there are "structures" which have been reared during the last few years, by certain classes of "our people," by "great effort, energy and patience," no doubt, but also by great shrewdness, cunning and unscrupulousness, which are structures of fraud, lawlessness and injustice; which are simply fortifications under whose cover great monopolies can carry on war against legitimate trade; by means of which small dealers are crushed and the strong are aggrandized upon the ruin of the weak. These structures have been built up in brazen defiance of the laws which seek to preserve for all men an equal opportunity. A more cynical contempt for law has never been manifested in any age than that by which a few of our "captains of industry" have evaded and annulled the plain statutes of the nation. A system of railway discrimination has been erected which, in its intricacy and craftiness, will be the wonder of the following generations. The laws plainly require the railways to serve all men alike, and late investigations show that more than sixty different methods have been devised of evading these laws. For this lawlessness the rail-

way managers are not chiefly to blame: the greater responsibility lies with the big shippers.

It is by this iniquitous system of railway discriminations that many of the swollen fortunes have been heaped up. Some of the great combinations have been employing these unjust and illegal methods for well-nigh a generation; the enormous advantages which they have thus secured have made them more powerful than any ruling class which ever existed on the face of the earth.

Now it is these "structures" of illegality, of oppression, of plunder, that the American people propose to tear down. They have been hearing about this kind of injustice for a good many years, and their exceeding good nature has kept them incredulous far too long. But they have been taking notice of late, and their minds are made up. They do not think it expedient, in a democracy, that aggregations of wealth should be permitted to erect such "structures" of privilege by means of which they may levy tribute upon the industries of the country. They even suppose that laws are intended, in a democracy, to prevent and to punish aggression of this nature. And they are going to take a very lively interest, in the immediate future, in the question whether a democracy is strong enough to prevent the existence of such oppression.

The system of railway discrimination will have to come down, and along with it the monstrous injustices of our robber tariffs, and along with these those schemes of high finance by which industry is crippled for generations to pay the fictitious debts of over-capitalization. There is, indeed, quite a little tearing down that will have to be done, and it is to be hoped that the people will continue, for some time to come, to be in the mood of doing it. And it is more than probable that in this process some stock values will be lowered. The stock values which have rested on the systems of spoliation, of which I have spoken—which have been raised to enormous figures by the illegal railway discriminations and the robbery of competitors, are likely to shrink somewhat when the props of monopoly are knocked from under them. Some innocent persons will suffer in that shrinkage, of course; it is never possible to overthrow a long-standing social injustice without inflicting injury on many who are not directly responsible. In one sense we are all to blame; we have stood silent and have permitted these injustices to intrench themselves; we ought to have known that the day of judgment would surely come.

There is no purpose, at this moment, of attacking any man or any corporation whose business is honestly, lawfully, fairly carried on; and no wish to pull down any enterprise which is not a defiance to law and a menace to liberty. The great multitude of business men, manufacturers, merchants, large and small dealers, who are prosecuting their industries lawfully and honorably, have not the slightest reason for apprehension on account of any feelings that now exist in the hearts of the American people. Nobody who has any appreciable influence wishes them any harm. Nobody whose opinions need to be considered has dreamed of attacking them or tearing down their prosperity.

It is a clever trick of the robber barons of our industry, whose piratical "structures" have got to be torn down, to try to associate themselves with the legitimate commercial enterprises, and to make out that these also are the subjects of popular displeasure. But honest business men will be very silly if they give any countenance to such a judgment. Much more foolish will they be if, by their silence or their speech, they permit anybody to infer that they are identified in any way with those who are now under the censure of the law.

It is highly important, at this stage of affairs, that a wide and clear demarcation be made between business which is lawful and honorable and business which is unscrupulous and piratical; and there are no persons among us who can help so much to keep this distinction clear and sharp as the honest business men themselves. If they permit it to be blurred it will be a sorry day for them.

The one danger in sight is that this distinction may be blurred; that the popular mind may be infected with the suspicion that all business is piracy; that the competitive system is essentially

iniquitous. That suspicion has not yet, as I have maintained, obtained any strong hold upon the popular mind, but it is entertained by many persons, not all of whom are fools or knaves. There is danger that it may spread, and the only people who can prevent its spreading are those whom I have characterized as our honest business men. If they are lukewarm about this, if they allow the impression to get abroad that they are in sympathy with the methods of piracy and plunder, then we shall be in danger of a tearing down which will be a great deal more destructive than anything which has yet been threatened.

For the present that danger is not imminent. The rank and file of the American people still believe in liberty and democracy, and are making a strenuous and hopeful effort to restore the equalities of opportunity which have been so seriously encroached upon during the past quarter of a century. Their idea is that if the rebate robberies can be exterminated, and the railways can be made to render to all citizens an equal public service; if the monstrous favoritism of the tariff can be cut out; if stock watering can be brought under control; if the public service companies in our cities can be prevented from obtaining for nothing franchises worth billions; if the raiding of trust funds by promoters can be stopped; if a few other such colossal oppressions of the weak by the strong can be restrained, we may yet have, in this country, a fair show for the common man, a great alleviation of the burdens resting on the industrial classes, a much more equitable distribution of the products of industry. They know that if these ends, of which they are now in pursuit, can be gained, there will be no more fortunes of a thousand million dollars heaped up in a generation; but they think that there will be a far larger number of those who will attain to an honorable competence, and that the standard of living will be raised for the whole population. This is what they believe in and hope for; and the way to it, as they think, is thru the destruction of monopoly and iniquitous privilege and the restoration of a fair measure of industrial freedom.

This is what they are asking for at present. If they fail of this they are likely to ask for something which will cost a good deal more, and which may not do them so much good when they get it.

COLUMBUS, OHIO.

A Mexican Lullaby

(To Jack and Priscilla.)

BY GRACE HAZARD CONKLING

AWAY across the yellow plain
The sleepy sun before he goes
Has hung the shoulders of the hills
With velvet folds of gold and rose:
And in the garden of the sky
The petals of the stars uncurl
Like flowers blooming overhead:
It's sleepy time, my little girl!

The mules are safe in the corral:
The burros on the homeward road
Trudge patiently along and think
Of laying down the heavy load:
And high upon the mountain-side
The goat-herd's camp-fire, all ashine
Tells that the goats have gone to bed:
Good-night, O little boy of mine!

What if the big white stars come out
And find the whole world sound asleep
Excepting just small boys and girls
Whose wilful eyes wide open keep?
And there are little winged dreams
Fluttering 'round your beds at night,
That will not kiss your wide-open eyes—
So cuddle down and shut them tight!

SAN LUIS POTOSI, MEXICO

DRY FARM RYE FIELD WESTON COUNTY, WYOMING.

What Is Dry Farming?

BY WILLIAM C. DEMING

EDITOR OF THE WYOMING TRIBUNE.

TWO years ago in the Rocky Mountain West dry farming was a joke and a by-word. Today hundreds of thousands of acres are, or soon will be, under cultivation by this method; thousands of sturdy men are its devotees, and only a few weeks ago three hundred interested and enthusiastic delegates and as many visitors from fifteen arid and semi-arid States and Territories met at the Trans-Missouri Dry Farming Congress in Denver, and registered their faith in a movement which is to join hands with irrigation in reclaiming the barren wastes of the West.

Technically speaking, all that section of country in which the annual rainfall is less than twelve inches is called arid. Where the rainfall exceeds twelve inches and is less than twenty inches, it is called semi-arid. For convenience and easy reckoning, draw a line from Bismarck, North Dakota, thru North Platte, Nebraska, to Laredo, Texas, and all that country to the westward to the Sierra Nevadas and the Cascade Mountains may be termed arid or semi-arid, and it embraces more than one-third of the entire United States. In this section is all that is left of the public domain, and it is the hope of the men and women, who, crowded out of the congested East, desire to carve out new homes in the West and transmit to their children a family roof-tree.

It should be remembered in passing that the most liberal estimate ever placed upon the amount of arid and

semi-arid land which it is possible to reclaim by irrigation, if all the waste waters were utilized, is 10 per cent. of the total area, and this doubtless is twice too much.

After counting out the irrigated land, the mountainous lands, the worthless lands, the timbered lands, the mineral lands, the Government reserves, and all other lands suitable for grazing purposes only, we may have left 20 per cent. of the whole section reclaimable by dry farming.

The arid and the semi-arid West for forty years or more has been largely a sheep and cattle pasture, and it is conservatively estimated that it requires from twenty to one hundred acres to support one animal, the average being about thirty-five.

It will be readily seen, therefore, that if after all the available water has been used for irrigation, there is still an agency by which other millions of acres may be reclaimed, then cosy homes will replace the sheep wagon and school children will romp where only lambs frolicked before.

THE RAW PRAIRIE WITH PLOWED STRIP IN BACKGROUND.

What, then, is dry farming? In plain words, it is farming successfully with the natural precipitation, which must be so conserved and used as to obtain results. The world has plodded along for several thousand years, and yet it has occurred to but few people, until within a decade, that it is possible to store up the moisture as it falls and use it when desired. When rains come and the snow melts upon the native sod in the arid and semi-arid West, the moisture is either quickly evaporated from the surface or passes into the ground, from which it is almost as quickly drawn by the same process of evaporation.

When the land is plowed and permitted to lie without subsequent tillage, the moisture, whether from rain or melting snows, soaks into the ground, possibly to the depth of the furrow, from which it is again withdrawn by evaporation. Influenced by the heat of the sun and the aridity of the atmosphere, the surface bakes and a crust is formed. The untutored and uninitiated, as it were, in the dry farming cult, would no doubt assume that the crust so formed

would act as a protection against the "drawing" influence of the air and sunshine, and would therefore prevent evaporation. The reverse is true, and herein is the key that unlocks the secrets of dry farming. The crust so formed is cellular. It is full of little holes thru which practically all of the moisture beneath passes out into the air.

In the arid and semi-arid West, particularly in the rarer atmosphere of the higher altitudes, the evaporation takes place so rapidly that the residents of those regions almost invariably underestimate the annual rainfall. The average altitude of the arid and semi-arid region is about one mile above sea level.

Since dry farming has been reduced to a science it will not be amiss to use scientific terms where they elucidate rather than obscure the subject. The process of evaporation thru the cellular crust above referred to is the result of a force known as capillarity. A familiar and effective example of capillary attraction is that of holding the edge of a lump of sugar in water and watching the moisture move steadily toward the top. Or a better example still, in which capillarity and evaporation are both illustrated, is found in the lamp, the flame of which consumes the oil as fast as it rises in the wick, thru capillarity, just as the warm dry air consumes all the moisture in the ground by means of the cellular "earth-wick."

It must be evident then that if provision is made by which the precipitation, which readily passes into the soil is prevented from passing out by capillary attraction and evaporation, we are in a position to use this moisture and produce a variety of crops; it having been demonstrated conclusively that agriculture can be carried on successfully and profitably with a minimum of twelve inches of precipitation, if all is devoted to the right use.

HARVESTING DRY FARM POTATOES, CHEYENNE, WYOMING.

As a rule, it is better to let a piece of ground, whether fall or spring plowing, lie fallow during the summer, seeding it each alternate year. During the fallow

season the surface of the plowed ground should be harrowed or stirred after each heavy rain, or big snow, thus forming a dust mulch or blanket, as it were, by which capillary attraction is destroyed and evaporation reduced to a minimum. Even the casual or indifferent student of agriculture will see that the effect of harrowing after rain or snow prevents the forming of a crust and the consequent cells which accelerate evaporation.

Thus the secret of dry farming is the conservation of the moisture that falls, and the secret of the conservation is the destruction of the little cells at the surface thru which evaporation is so active.

VIEW OF THE DISK PLOW AND TRACTION ENGINE IN STUBBLE FIELD, CHEYENNE, WYO.

and the secret of the destruction of the little cells is frequent harrowing of the surface, which prevents the forming of the crust.

The soft dirt or granular condition permits the moisture to pass rapidly into the ground and likewise holds it where it will do the most good. That in brief is the science of dry farming, which after all is not "dry" farming, but the intelligent retention and application of all the moisture that falls in a section of country whose agricultural possibilities have heretofore been considered more than doubtful.

Accompanying this article is a picture of the raw prairie as it has stood from the earliest recollection of man. Another picture illustrates the act of turning over this natural sod and the others the astonishing growth thereon. These are not "stage pictures," not pictures made for this article, but the actual scenes of farming without artificial irrigation near the city of Cheyenne and other places in Wyoming, where until two years ago no one had the temerity to undertake to farm. One of the most successful cattle growers once said to me, "I think the Lord knew what he was about and left the right side of the soil up." This remark illustrates the prejudices which the would-be farmer in the arid West has had to encounter and is only one of the many difficulties which he must overcome.

Land which I have seen sold for $1.50 per acre is now growing thirty-five to forty bushels of wheat to the acre; fifty to sixty bushels of oats; forty to sixty bushels of barley; bountiful crops of field peas used as winter feed for sheep; one hundred and fifty bushels of potatoes to the acre and as fine a stand of alfalfa as I have ever seen in any irrigated section at the same period of growth.

Within the last two years, hundreds of thousands of acres of grazing land in Wyoming and Colorado have been sold

and are being cut up into small tracts and disposed of for dry land agriculture to farmers from every State east of the Missouri River.

Under the "Campbell System," as it is known in the Dakotas, Nebraska, Kansas and Colorado, and the "Cooke System," as it is known in Wyoming, Idaho and Eastern Oregon, the dry farmer plows his ground from eight to ten inches deep, preferably in the fall, in order that it may receive the benefit of the winter snows. As a further advantage the land is plowed at right angles to the prevailing winds that the trough of the furrow may catch and hold as much snow as possible. Where and when it is too dry for fall plowing, then early spring plowing should be done, using always the same system of harrowing after heavy rains. An industrious boy with three sections of a steel harrow will cultivate thirty acres a day.

In conclusion, however, it should be borne in mind that experience has already demonstrated that alfalfa, the greatest forage crop known to any arid region, will grow on unirrigated sagebrush or prairie land, if the Campbell or Cooke system is rigidly followed.

The important things to remember about dry farming are the following:

That twelve inches of rainfall properly conserved in the soil will produce thirty to forty bushels of wheat to the acre each alternate year;

That the soil of the arid region possessing all its virgin elements of strength, is the most fertile in the world and under dry farming, it is likely to remain so, for while all of the moisture is conserved on these lands, in the East where the rainfall is more copious much of the plant nourishing elements are washed away;

That good arid land can be purchased at from $1.50 to $5 per acre;

That dry farming is reasonably sure farming if the farmer is industrious, dili-

HARVESTING UNIRRIGATED GRAIN, CHEYENNE, WYOMING.

gent and intelligent, and has sufficient capital to tide over the first two years, or the preparatory stage of his farm;

That arid land which will produce nourishing grass and hay sufficient to feed and fatten 80 per cent. of the sheep and cattle of the United States, will produce other and better crops with other and better systems;

That in the Rocky Mountain West, the rain falls when most needed, from March 1st to September 1st;

That nothing is lost, but much is gained by cropping a particular piece of land only every other year, except, of course, perennial crops like alfalfa;

That in every country where land is so cheap a farmer may own enough so as to follow the alternate year and scientific system to the letter and yet be producing large crops of grain on different areas each year;

That the most successful dry farmer is he who uses his head as well as his hands and seeks out the most successful drought-resisting plants and grains by intelligent seed selection;

That among the crops which have been profitably grown by the dry farming method are wheat, kaffir corn, barley, emmer, commonly known as spelt, alfalfa, bromus inermis or brome grass, oats, rye, field peas and many hardy vegetables;

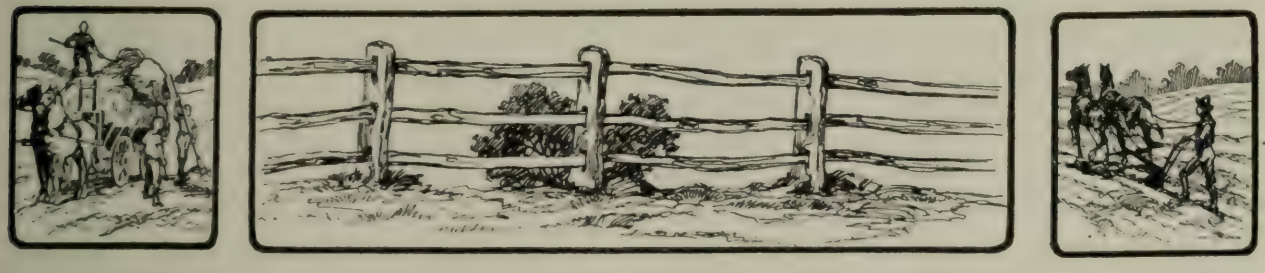
That the average yield of wheat per acre, the United States over, in 1904 was only 12½ bushels and oats 26 7-10 bushels to the acre. In 1905 wheat averaged 14½ bushels to the acre and oats 28 8-10 bushels to the acre;

That you can beat the average, under dry farming, in the worst years;

HARVESTING DRY FARM POTATOES, CHEYENNE EXPERIMENT FARM.

That the motto of the dry farmer is *"One plowing, frequent harrowing, two years' moisture—one big crop."*

Many dry farming authorities and enthusiasts assert that agriculture can be successfully followed thru scientific cultivation with ten inches of rainfall. If this is true, there is an abundance of en-



couragement for the dry farmer in the records of the Cheyenne Weather Bureau for the past thirty-six years, the average being in excess of thirteen inches.

My own opinion covering a more or less careful observation and study of the subject for five years is that dry farming is not only possible, but may be made profitable if the prospective farmer unites "Faith, Hope and Charity" in his efforts, if he be intelligent and industrious, if he will apply the knowledge and experience already gained by others with assiduity, and has the pluck and the resources to stay with the proposition for five years. Already dry farming has added millions of dollars to the assessed valuation of the West.

I have omitted roseate experiences and the figures of many practical dry farmers the accuracy of which I have no reason to doubt, fearing to try the credulity of the reader, and for the greater reason that in a new movement like this it is better to err on the side of conservatism than optimism.

And, lastly, the arid and semi-arid West does not desire a sudden land boom. A steady influx of practical farmers, who will stay, is the real desideratum.

CHEYENNE, WYOMING.

Yeast-Stirrers in New York City

BY MRS. L. H. HARRIS

[At the solicitation of THE INDEPENDENT, Mrs. Harris recently paid her first winter visit to New York City, and was plunged for a few weeks into the center of the maelstrom of "world movements," where nothing is regarded as settled and unquestionable. The wild whirl of ideas and purposes seems to have dizzied her somewhat, but she keeps her bearings by the ancient landmarks.—EDITOR.]

BY yeast-stirrers I mean those persons, of both sexes and every persuasion in New York, who think they are creating the sentiment that will leaven American life.

"You are now listening to men and women who are molding public sentiment for the whole country," said a famous editor, quite seriously, after we had heard one of them explain why a good man was bad and a bad woman was good. That was done as simply as a kitten chases its tail, and very much in the same manner, except that the process was intellectual and dignified. I pass over the editor's pathetic egotism, but I wish to call attention in this article to the yeast-stirrers and their leaven. For one thing the thinking people there appear to have had their moral natures turned hind part before. And altho they have the best intentions in the world, I am bound to hold the yeast-stirrers themselves responsible for this rear-mindedness. They may think it is originality, but it looks more like aboriginality. And, of course, the contrast between them and normal people is diverting, whichever way you look at it. For example, if you wish to appear perfectly absurd among them, get down to particulars; talk about something less universal than "life"; admit that you are not engaged in a "world movement"; that you are not "planning a great work." (Every yeast-stirrer magnifies himself with this phrase.' It is the Aurora Borealis which shines above his

little pot.) Say that you have no new theory of social salvation for the race; confess that you are as ignorant of "Romantic Obscurantism" as an unborn child; but insist that marriage is sacred, whether happy or unhappy, and that divorce is at best an ignoble retreat where honor and duty claim you; and hold that righteousness is more important to learn and to practice than a stark-naked humanitarianism which makes too many excuses for unrighteousness, particularly of the flesh which makes us human — I say if you wish to feel like an antiquated formula for prim hoop-skirt virtues let the yeast-stirrer know that this is the pattern of your mind. Meanwhile, you may add to your confusion by making a few observations concerning theirs, and, for the sake of clearness, the reader must understand that those mentioned in this article are highly respected members of society. Some I met at the Authors' Club, others were in the most prominent pulpits in the city, still others were prominent in municipal affairs. Some were at a Socialists' meeting where an Episcopal clergyman and a famous woman were among the after-dinner speakers. Not one, so far as I know, belonged to bohemian circles—for bohemians are only the product of this leaven. The man I heard inveigh against marriage as an unbearable hardship upon wives and an unimaginable bore to husbands, and who expressed a willingness to welcome illegitimate children into his own family, was not a bohemian nor a hobo. He is a gentleman of unimpeachable character, who occupied as long as he wanted it a chair in one of our great universities, and his writings now appear in a magazine noted for its conservatism and for its large circulation. Nor did I see any yeast-stirrers when I went prospecting for human nature in the Bowery. I found the human nature, to be sure, but it has not been leavened much with yeast of any kind. And I did not see them at anarchists' meetings on the East Side. "A watched pot never boils," and the police over there are very narrow-minded. Besides, it is not the fashion now in New York to be an anarchist. But a "terrorist" may be a social lion if he likes. The explanation is that a terrorist only wants to throw bombs in Russia, while an anarchist will throw them here at home if he is not sufficiently snubbed.

The first thing which impresses the stranger is that these are a new kind of good people who have no illusions, but who have more delusions than even their benighted forefathers had. A man whose admirable character bears testimony to his Christian rearing denied the existence of God so mincingly that I wondered why his guardian angel did not flash in and spank him body and soul. Another boldly declared that George Washington played such a gallant part in the Revolution, not because he was a patriot, but because he had vast tracts of land that would be more valuable under a free government—think of Washington as a "promoter"! —very soon this will get out, of course, and then the children of New York will not even have a father of their country!

No words can express their contempt for the tricks of commerce, for the graft of government, for the serpent power of Wall Street. Everybody is a rascal except Hearst, and the rest of us have no doubts about him. What we want to know is, Why do so many yeast-stirrers choose Hearst of all men to idealize? I reckon it is for the same reason Eve picked out the devil in paradise to advise with her. She felt limited by her own innocence. But Hearst is not their only delusion. One of them told me that so soon as he got the time he meant to "rewrite religion." I do not know whether he was repeating a smart-sounding epigram that he had heard somewhere, or if he really intended to take a day off and crochet a Pentateuch and a New Testament out of the abundance of his own heathen imagination. But it will be seen from the foregoing that a yeast-stirrer's chief delusion is the confidence he has in his leaven.

Another characteristic by which they may be recognized is that each of them has time by the forelock in one hand and what he calls "the revolution" in the other. And not one of them feels bound by any law of logic to stir any particular kind of yeast, but they all stir

frantically whatever can be fermented. I recall a certain leaven-dealing hero who is a member of the Universal Peace Movement, while taking a prominent part in the terrorists' meetings of the Russian revolutionists. And he thinks that he is a rational being. It may be that we are in equal need of both, but it would be so much more intelligible, not to say influential, if the peacemakers did not try to be terrorists. However, even the preachers cannot make this distinction. There is that famous New York preacher crying out: "I am a terrorist. I am with every assassin in Russia!" Now cannot the good doctor understand that this shout does not go with his hymns or sermon on Sunday? Doubtless his moral sense is all right, but the leaven has distracted his reasoning faculties, or he would be able to put two and two or even one and one together so as to compute how long it will take him to convert a man to Christianity, and then leaven him into a terrorist and assassin. Never have I seen such brilliance of mind, such kindness of heart mixed with such irrational and unscrupulous motives.

And, again, when you are associated with cultured people who avoid the use of such terms as right and wrong, know that you have "come up higher" among the leaven-makers. They cannot tell the difference between *saying* a thing is so and the truth. With mere words they accomplish things to their own satisfaction which have always taxed the angels in heaven. They look their Lazarus City in the face and say, with an ecstatic smile: "There is no evil!" As time is a term to denote our limited segment-sense of eternity, so evil is only "a stage of goodness." If old, sleepless, miserable, blear-eyed New York ever gulps this yeast it will be a long continued "stage!" This brings us to consider the altruists more particularly, all of whom are mighty stirrers. And they are the queerest people of all. A New York altruist is one who would as lief mislay his morals or his conscience as not, but he sticks to his theory of ethics thru good and evil report. He does not necessarily give his money to feed the poor at home, but he will give his fortune to the fund used in Russia for the blowing up of banks, for the killing of officials and the support of the Duma. He will accept a salary of $100,000 to preach poverty on the editorial page of a paper which is sold out to "other interests" everywhere else. He will lay the scenes of his novels on Hungry Street, on the East Side, and while he is writing it, gorge himself at the Holland House every day till the very jowls of his genius stick out. This kind stirs his yeast with a "muck-rake." Or he may be a great ethical teacher, who has been divorced for no better reason than the one given by the young negro woman: "Jedge, I des done loss my taste fer dat nigger Jeems!" I was myself invited to attend a series of lectures on ethics, given by a person who disposed of his children as naïvely as ever Rousseau did of his.

Not all the yeast-stirrers in New York are indigenous—quite the reverse. If a man gets a bee in his bonnet anywhere—wants to start a revolution, or a new philosophy, or rewrite religion—he comes to New York and joins the leaven-makers. It affects him that way. These are the ones who have so much to say about their desire to "live life in its fullness." What they mean by "fullness" is entirely too much. They want to flourish like green bay trees. For this class "life" appears to be a sort of hilarious atmosphere in which man is dissolved and becomes a joy-eyed, procreating factor for the future. This is fortunately very vague, but I met at least one avatar of such a movement—a chaste and honorable person really, but he was a humanitarian who had been leavened into the last stages of sentimental decadence.

It is with peculiar diffidence that I mention perhaps the largest class of yeast-stirrers in the city—the Socialists. This is becoming, because every one of them with whom I conversed expressed compassion or contempt for my invincible ignorance of the subject. It is a charge they usually bring against people who disagree with them. Now I restrain myself from becoming a Socialist on the grounds that it is a rational theory of government, suited only to rational people, whereas, some of us (Socialists in particular) are not always rational, and

the *test* of a government is whether it can hold things together when we are not reasonable, or good, or even decent. So soon as they can arrange these little matters I desire to become one. Meanwhile I have a sort of literary antipathy for their monstrous vocabulary. My taste is offended at the ugliness of Socialism expressed in words. The sweaty adjectives they use, the meat-ax phrases and granary terms all sound as if they belonged to a science for exploiting the economics of cattle. A man may drop a thousand years in the scale of things thru one sentence written by a really learned Socialist. It is the only language I ever heard which gives the impression that it still has the monkey hair on it—ugh! However, the Socialists are the most important leaven-makers in New York. For one thing, they are producing a new mind. It is callow and crude now, aboriginal as compared with what it will be. The proof of this is their predilection for horrors (a primitive trait) and their lack of humor. As for humor, I have never seen one who had any, altho they do not lack irony—which is as different from humor as a claw is from a smile. For example, Upton Sinclair told me that he meant that story of the squealing pig in the early chapters of "The Jungle" to be humorous! It is, but because the author has treated an absurd subject seriously, and he did it because there is not a ray of humor in his mind. I ought to say in this connection that Jack London has just made the same comment on me; said I was "totally without humor." This is a relief. I have sometimes feared that the reason Socialists excited my risibles so much was because my sense of humor was abnormally developed. Another evidence of the rudimentary development of the Socialists I have met is that they are morbid. It is only a step from that to being rabid. They all have a mania for sorrows, and a fury, a bitterness of mind, which alienates people and accounts in part for the comparative futility of their efforts. But when they get thru this first stage they may indeed become the yeast-stirrers for the whole country. The important thing now is to try to teach them some patience, some toleration and a little grace, if we can.

And what are some of the effects of these various leavening compounds upon the people?

The yeast of the Socialists is distinctly political, and many of them boldly claim to be responsible for nearly all the reforms in the city, but somehow they don't get elected to anything. When Jack London ran for Mayor of Oakland, Cal., a few years ago, on the Socialistic ticket, it is said that he received one vote, possibly two. But a Socialist would "run" even if he received no votes at all. Just as Bill Nye once challenged John L. Sullivan, not because he expected to knock him out of the ring, but because he liked "to be mixed up with him before the public." It is a way they have of creating public sentiment. But that is the reason they are not elected. They have created too much already.

But here are some of the results directly attributed to the leaven which I have tried to describe.

(1) I heard much more sentiment expressed in favor of divorces than for marriage. This is the case to such an extent one is surprised that the young people should dare to marry at all. And it is a fact that most of those who get old enough to observe and consider do not. Many of the most admirable men and women I met were single for this reason. No yeast-stirrer has intimated to them that the way to reform marriage is not to break it with a divorce, but to get in it, stay in it and work out the trouble, whatever it is, from the inside.

(2) The people who are so cultured that they speak according to art rather than morality, who have no sternness of mind, no salutary narrowness of judgment and principles, are in a large measure responsible for the class of popular heroes and heroines ever before the public in New York, either on the stage or in the jails. While I was there Stanford White, Evelyn Thaw and her husband were the ones in court, and "Salome" the one on the stage. Novelists went down and took notes at the trial, so as to get popular yeast for their next stories, and young girls were not ashamed to express their sympathy for "poor Evelyn." Poor Evelyn, by all means! but it is as disgraceful to discuss her as it is to tear the rags off of a body that has been dragged

out of the river. At no time did a respectable person appear in the hero rôle, and if he had, the question is, would any one have been interested in him?

(3) The romance of Socialism has taken the place of religion in the spiritual economics of many of the yeast-stirrers. The altruists have defrauded the people also with their holiday-cake ethics and fine talk with tea afterward. Still others have fooled themselves by the rational process so common among yeast-stirrers. One lady, upon hearing that in a certain mountain section the people "got religion" during the summer and backslid during the winter, exclaimed: "If only they could be kept comfortable they would be good all the time!" It was useless to call her attention to the incredible wickedness among the people in her own city who were most comfortable, and there are thousands like her, who believe that virtue is a matter of diet and sufficient clothing.

(4) Another evidence of the leaven was in the pulpits. So many of the people give the impression of being without a pastor, in spite of the numerous churches. This was intelligible when I heard a sermon from the same minister who proclaimed his sympathy with the Russian Terrorists. He chose for his text one of the miracles of Jesus, and proved, with pathological minuteness, that it was not a miracle at all; said that his own mother had done greater things. At the conclusion of the service he had the effrontery to address the Lord in prayer. To be sure, it was not much of a prayer, merely a polite address, which really meant that the petitioner did not expect anything from that source. Now it may be that Jesus performed no miracles, and it may be that, after all, he is not the divine Savior of the world, but it gives people a bad, lonesome feeling to be confirmed in this idea, and there are enough trying to do it without the aid of the preachers. If they could hold on to the faith a little longer it would do more good than throwing bombs, even by proxy, in Russia.

(5) And, as a matter of personal experience, I may add that the subconscious effects of having so many vagaries about is not good for the mind. During the last ten years I have written with sufficient clearness not to be reckoned among cranks. But while I was in New York my mind was so far dissolved that I wrote an article which showed remarkable signs of mere vaporing. The proof is that I received letters from strange, mad people who believed that the person I referred to in the article written during my stay there was the "elaborator of the 144,000 super-men prophesied in the Scriptures." Others thought that I had caught a vision of "the celestial spouse" described by Swedenborg. Now heaven forbid that I should conceive of such a person! And under ordinary circumstances I could never have laid myself open to such a suspicion. But I confess my fault here, in order to warn people against the curious leaven of that wonderful city. The makers of it are more than clever. They are kind. They have new virtues that I never saw before, which make them adorable. They practice a golden rule of almost heathen dimensions. But they insist upon being elevated by the most diabolically erroneous opinions, and that makes the yeast bad. But I do not know what is to become of the "second generation" in New York if these good people keep on talking so bad. The danger is not to them. They were properly brought up by parents who got the yeast for that business out of the Ten Commandments, and so they have characters that survive their scandalous doctrines, but the good Lord have mercy upon their children. Fortunately, when people get very decadent in their views of life, they do not want children, and I have heard that in New York already the better classes (?) are eliminating them.

NASHVILLE, TENN.

Zionism, a Retrospect and a Hope

BY RICHARD GOTTHEIL, Ph.D.

[Dr. Gottheil is Professor of Semitic Languages in Columbia University, and is the author of many books and magazines on Oriental topics. From 1898 to 1904 he was President of the American Federation of Zionists.—EDITOR.]

THERE is a well-known talmudic discussion turning upon the sixth verse of the Twenty-fourth Psalm in which one party holds that "the time is adapted to the leader" while the opposite party holds that "the leader is adapted to the times." Both opinions are true regarding the late Theodore Herzl, the founder of modern Zionism; and the success that attended his efforts is proof of this contention. He found his fellow Jews unimaginative; he fired their minds with a romantic fancy. He found them divided by petty distinctions and discords; he offered them a hope and a faith. After devoting the tireless energy of his ripest years as a proof of his own conviction, he sealed his service with his life's blood, looking with prophetic eye into the promised land, whither he himself was debarred from leading his people. The seven years of plenty in the Zionist movement came to an end with Herzl's death in 1904. Were they to be followed by seven lean ones? His qualities of leadership, his sterling character, his winning ways had given him a position among the Jewish people which, perhaps, no one could ever regain. In the plenitude of his power and the heyday of his strength, neither he nor those of us who stood near him imagined that the end could be so near. His death left the ranks transfixed with amazement. His hand had held all the strings in a comprehensive grasp and there was no one man to take his place. Well-nigh three years have now passed. The recovery has been slow; for the old infirmity of purpose has been in danger of asserting

itself again; the old unimaginative routine Judaism has had a new chance of life. Happily the seed had been planted too deeply. Tho the finest flower had been cut off, the stem still remained healthy. The Jewish conscience had been stirred too deeply. The fire had been relit. It might burn itself out; it could never be smothered again.

The idea of a universal Church had informed the policy of the middle ages; the hope of a universal State had animated the leaders of the eighteenth and part of the nineteenth centuries. But while such romantic ideas were being conceived and acted upon the birth-throes of another movement were in progress. The various races of the world were beginning to bestir themselves. Disraeli never spoke a truer word than when he said "race is the key of history"; speaking as he did from the consciousness of his own racial affinity. Slowly, and with much creaking and groaning, the various families of Europe and even of Asia began to stir. Greece reasserted itself. A Roman nation was reborn. The Teuton carved a place for himself in the highest niche of fame. Nationalities which had been cast to the lumber heap of the past emerged once more—Servia, Bulgaria, Rumania, Ireland, commenced to feel an inward power and to demand the rights of existence. Japan and China are even now setting an example for the other races of Asia. Clearly, nationalism was not a thing of the past and racial distinctions could not be blotted out either by the generalship of a genius or the ferocity of a mob.

The Jews were the last to feel the stir of the new era. They had shouted loudest for the German Empire; they had been the most protesting chauvinists in France. They had been more Polish than the Poles. One fine day they awoke to find themselves strangers in Germany, attacked in France, ostracized in Poland. Much paper was smudged to prove that they were Germans and French and Poles. To do this they had stripped themselves as much as possible

of things Jewish. They sat there naked and shivering in the cold of unfriendly blasts. Modern anti-Semitism has not indeed caused Zionism; but it was the touchstone upon which the spark was lit.

Signs of impatience among the Zionists had begun to show themselves even during the lifetime of Herzl. Perhaps he himself had seen the future in too roseate a coloring. He had imagined that a great part of the Jewish people would be fired with his own enthusiasm; that the rich would consider it an honor to devote their wealth to such a cause. With the Jewish toilers as his army and some little part of Jewish riches as his powder, he imagined he could break down any opposition on the part of the Sultan and procure the adhesion of the great World Powers to the plan of a Jewish autonomous settlement. The

A STREET IN THE COLONY OF PETAH TIKWAH.

measure of his own conviction was indeed large enough. He had organized the masses under the banner of an idea; he had placed his plans before the Sultan in Constantinople; he had interested a number of governments in his work. He had procured the Jewish parliament and the national bank. But the Jewish bourgeoisie held back and the Jewish millionaires held tight. The former remained indifferent; the latter could afford to play with millions in Wall Street or in Capel Court, but would not venture any sum at all for a general Jewish purpose. Herzl was left in the lurch. Then came the offer by the English Government of a tract of land in the East African Protectorate. Herzl readily accepted it; it was something tangible and could be used as an asset in dealing with the Sultan. Many of his followers, however, could not or would not understand the situation. The racial historical and religious feeling for Palestine revolted. The sixth congress (1903) discovered the cleft that had been wrought, and Herzl succumbed physically in attempting to heal the breach.

The outcome of this breach was a territorialist organization led by Israel Zangwill, which took form and shape

after the seventh international congress in 1905. That personal motives entered into this secession need not concern us here. It represented a real cleavage in ideas and feelings. It marked the distinction between Zionism as a mere charitable undertaking upon a large scale and Zionism as the expression of the heart and soul of the people—its definite longing, its prescience of its ultimate goal. With a program that differed little from that followed by those who control the Baron de Hirsch foundations—it being indifferent to the territorialists where a Jewish center is established — it is no wonder that they gained adherence both in the Jewish bourgeoise and even in the Jewish moneyed man. They demand no great effort of imaginative reconstruction, no great stress of Jewish consciousness. Any effort to ameliorate the condition of Eastern Jewries ought certainly to meet with no opposition upon the part of any Jew. But Zionism is a thing much greater than charity, "that plant divinely nursed." Terrible is the lot of the hunted Jew; yet the Russian Jewish question is not *the* question of all. Judaism and Jewish ideals are at stake; and to save these Zionism searches for a stable and a legally assured home in Palestine.

The Jews might learn much from the Irish. They, too, know what oppression means. They, too, have felt the direful effects of disintegration. They, too, know the futility of mere palliative charity. It is the Gaelic League that will one day bring about the salvation of the Irish, by giving back to the people their own national culture and by reinfusing them with their own ideals. In part, Zionism has done this for the Jew. It has called forth a new Jewish enthusiasm; it has produced a distinctly Jewish art; it has set in motion a distinctly Jewish literature; it has deepened in many the old religious consciousness.

An ancient saying of the rabbis has it that he who attempts to drive fortune is himself driven by fortune. Herzl had conceived his hand wrongly with the Jewish people; and the Sultan wishing to bring pressure upon them had temporarily closed Palestine to Jewish immigration. But since the last two or three years the Sultan has shown a more enlightened policy, and point has come to the thought that he desires to

SCHOOL HOUSE IN PETAH TIKWAH.

make Russia's loss his own gain. The Russian Jews are now going in some considerable numbers to the land of promise, trying to escape from the destructive and disintegrating influences that await them elsewhere. The suzerain must see the economic value of a hard-working, industrious and sober population, which can only increase the revenues which he himself derives from the land. But here, too, no patchwork policy on the part of those Jews who wish to help their brethren will avail. Real and provident statesmanship is needed, if the ghetto of Russia is not simply to be changed into the ghetto of Palestine. Schools on the one hand and opportunities for work on the other are the measure of help which Western Judaism must afford those who still are pioneers. Educational facilities are not wanting in Palestine. Good primary and secondary schools are to be found in Jaffa, Jerusalem and in some of the colonies; and in many of these schools Hebrew is the mother tongue. The Jewish Arts and Crafts School (The Bezalel) has been opened on ancient Zion; and the eagerness with which its courses have been besieged shows that the desire for manual occupation is strongly implanted in the

young. The Anglo-Palestine Bank—an offshoot of the Jewish Colonial Trust—is already established in Jaffa, Jerusalem and Beyrut, and it saves the needy colonist and the small merchant from the clammy grasp of the usurer. The Palestine Industrial Syndicate has lately undertaken to develop the industrial and mineral resources of the country and to tempt hesitating capital to one of the oldest of the world centers. Contiguous to Palestine are the fair lands of Syria, the verdant fields of Asia Minor and the immense tracts of Mesopotamia. The desolate cities may be inhabited once more, as the prophet Isaiah had foreseen, for railways are slowly spinning their web over the whole region.

Whether the ultimate consequence of all this will be what the Zionists hope lies upon the knees of the gods. The shame for its failure would rest not upon those who tried and dared and did, but upon those Jews who rock themselves in the consciousness of their own ease and security and who remain sternly oblivious to the life blood oozing out of their people. If the Jews were as united upon the Zionist platform as the Irish are upon their own national creed, sufficient force could certainly be brought to bear to assure its success. Unfortunately, they are not. A large number of the Jewish bourgeoisie in the cities of Western Europe and America feel the constraint only of their Jewish belonging; if they are religious their Judaism is nothing more than "an emotion in a vacuum." They cannot see that the world around them will never understand their position, and that as long as their position is not clear and defined anti-Judaism in some form will continue to exist. They believe in the thin rattle of their patriotic declarations, and they tumble over themselves in the attempt to please all parties. Their ideas of their own duties to their own people dance to the tune of their aspirations for political or for social standing. There are others who believe in keeping up the lines of demarcation which separate them from the rest of their fellow citizens. To what end? The rabbis tell them that they are a nation of priests and holy people; that they must remain the great missionaries of "ethical monotheism." But are they willing to assume such a rôle? We know the missionaries of other faiths; and, whatever we may think of their work, they are characterized by thoro devotion to their ideals and by an other-worldliness which compels our reluctant admiration. When we cease to gather riches, to build palaces and to gird upon ourselves all the trappings and garnishments of wealth, we may commence to think of turning missionaries. At present the real Jewish missionaries are those who are working and toiling for the race and for the faith—those pioneers in the resurrection of Palestine whom we do not understand and

RUSSIAN REFUGEES EMPLOYED IN THE VINEYARDS NEAR JAFFA.

whom at best we consider subjects for our benign tho often useless charity.

But alone Israel cannot bear the burden. Almost the smallest of peoples, almost the least of all the families of the earth, her authentic voice cannot be heard in the councils of the nations. Many sons and daughters have gone out from her loins and control the politics of the world. Too often do they appear impatient that the old mother still treads the earth. Is it a hope of perfection to imagine that the sons and daughters might undo the ancient wrong and seek satisfaction in a noble work of expiation? It is they that hold all the strings which move the shifting scenes of the world's stage. Would an appeal, not for a favor, but for a right, have any chance of success in this day of despite for the ideal? If altruism is the saving grace in the life of a man, ought it not to be in some little measure the same in the life of a nation? The lineal descendants of those great prophetical altruists, whose memory we all help to honor, are perhaps incurable optimists enough to believe this possible. Up till now they have prayed: "Oh bring us in peace from the four corners of the earth and make us go upright to our land, for Thou art the God who worketh salvation." What would be the attitude of Christendom if an attempt were made to translate this prayer into an actual fact?

The Salt Red Blood of Him

BY ALICE THACHER POST

THE salt red blood of him,
The small clean nerves of him,
The austere bones of him—

For loving,
For feeling,
For standing fast.

Shall he stand for less than Truth?
Will he feel for less than Man?
Can he love less than God?

CHICAGO, ILL.

The Monroe, Calvo and Drago Doctrines

BY HERBERT W. BOWEN, A. M.

[The American republics are very anxious to have the Drago Doctrine recognized as one of the laws of nations, and at the Pan-American Conference held last summer at Rio de Janeiro, they passed resolutions referring the matter to the forthcoming Hague Conference for discussion and appropriate action. The following article, therefore, by the Ex-Minister of the United States to Venezuela, is of much present interest.—EDITOR.]

INTERVENTION is a political rather than a legal act. While it has been based frequently on very flimsy pretexts, it has never been considered justifiable except in extreme cases; as, for instance, to preserve sovereign rights or interests, to maintain the balance of power, to prevent iniquitous revolutions, to stop a nefarious action on the part of a strong Power against a weaker one, or to obtain redress for unscrupulous dilatoriness in the payment of claims and debts. But as there is no obligation on the part of any independent and sovereign nation to submit to intervention, it may resist, and other nations may intervene, for good cause, to prevent intervention. Thus, when the Holy Alliance, formed by Austria, France, Prussia and Russia after the battle of Waterloo, with the object of defending and extending monarchical principles, announced the intention of restoring to Spain the Spanish American republics, the United States and Great Britain objected, and President Monroe put the objection into permanent form in his annual Message of 1823, and directed it against not only the Holy Alliance, but also the other nations of Europe. It was forthwith called the Monroe Doctrine. It is not a principle of international law, for it has never been accepted by the European Powers; but it is generally recognized as a declaration of our policy, and as a frank and timely notice of the reasons that we shall deem sufficient to justify us in intervening to prevent European intervention in this hemisphere. It has been concisely stated as follows:

"The American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subject for future colonization by any European Powers, and we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European Power we have not interfered, and shall not interfere. But with the Governments who have declared their independence and maintained it, and whose independence we have, on great consideration and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European Power, in any other light than as a manifestation of an unfriendly disposition toward the United States."

The first of those three sentences refers to the American continents generally, and may be fairly interpreted to mean that our Government would consider that it would have grounds sufficient for intervention if a European Power should attempt to increase its colonial possessions on the American continents or in American waters by conquest, encroachment, purchase or in any other manner, or should undertake to change the form of government in the American republics to the European type.

The second sentence deals with the existing American possessions of the European Powers, and contains a distinct promise and an emphatic guarantee to the European Powers that we shall not interfere with the possessions they already have on the American continents and in American waters.

So long, therefore, as we support the Monroe Doctrine we are under the most solemn obligations not to acquire sovereignty over any of the aforesaid American possessions except by voluntary transfer or purchase.

In the third sentence special reference is made to our sister American republics, and the position is firmly taken

that efforts to oppress them or to control in any other manner their destiny on the part of any European Powers would not be tolerated by the Government of the United States. Just what steps, if taken by a European Power, would be regarded as attempts to oppress them or to control their destiny is not stated. The omission naturally has been particularly noted by publicists and statesmen in our sister American republics, and various suggestions have been made by some of them of restraints that should be put upon the European Powers to keep them from molesting the weak American republics. The most interesting and astute of these suggestions were made by Calvo and Drago, the former a publicist, and the latter a Minister for Foreign Affairs, of the Argentine Republic, and are known to the world, respectively, as the Calvo Doctrine and the Drago Doctrine. Of the two Calvo's Doctrine is the earlier in date. It was published in 1868 in his work on international law entitled, "Derecho Internacional Téorico y Práctico de Europa y América," and it maintains that neither diplomatic nor armed intervention should be recognized as legitimate methods for enforcing private claims of a purely pecuniary nature that are based upon contract or are the result of civil war, insurrection or mob violence. In other words, Calvo would have all such claims referred, where they arose, to the law courts, and decided, and finally disposed of, by them; and he would deny to foreign nations the right of intervening thru the ordinary channels of diplomacy or by force to secure justice for those of their citizens or subjects whose claims did not receive in the law courts fair and impartial consideration. As the Calvo Doctrine relates to only private claims, it might naturally have been expected that a doctrine would be brought forth at the proper time to cover the question of public debt. When Germany, Great Britain and Italy instituted the blockade of the Venezuelan ports in 1902 that time arrived, and the doctrine was promulgated in an able letter that was dated December 29th, and that was addressed to Señor Mérou, Argentine Minister in Washington, by Señor Drago, who was then the Argentine Minister for Foreign Affairs. The principle for which he asked recognition was succinctly stated by him to be this: "That the public debt cannot occasion armed intervention nor even the actual occupation of the territory of American nations by a European Power."

Both the Calvo and the Drago Doctrines are strongly supported by public sentiment in our sister American republics, and have been widely discussed in the United States and Europe, but they were practically, or at least temporarily, rejected in 1903 by Germany, Great Britain and Italy when they demanded of Venezuela the payment of private claims and the public debt, and occupied her territorial waters, and by The Hague Tribunal, which decided that for the very reason they had resorted to armed intervention and the occupation of Venezuela's territorial waters they were entitled to preferential treatment in the settlement of their claims over the rest of Venezuela's creditors who had taken no belligerent action. As the United States did not intervene to prevent the armed intervention of the three Allied Powers or the occupation by them of Venezuela's territorial waters, it was clear that their action was not deemed to come within the scope of the meaning of the language used in the third section of the Monroe Doctrine in regard to oppressing our sister American republics, and that, consequently, the Calvo and the Drago Doctrines must be regarded as independent principles, and must stand on their own merits.

The dissatisfaction that was expressed by many publicists in Europe as well as America with the decision rendered by The Hague Tribunal in the Venezuelan case has encouraged the supporters of the Calvo and the Drago Doctrines to renew their efforts to get them recognized as principles of international law. Favoring the two principles are a number of weak republics, some of them highly respected for their steadiness and some of them always suspected of unsteadiness, but all of them fearful that the strong Powers of Europe in their lust for expansion may make private claims and public debts easy pretexts for occupying

and colonizing their territory; while opposing the two principles are the strong Powers in question which have had at one time or another, as no one denies, good and substantial reasons to complain of the "bad faith, disorder and deliberate and voluntary insolvency" of nearly all of the weak republics.

The fear of the weak republics is based, it would seem, not so much on present conditions as on future possibilities, for the European Powers in all recent controversies with them have generally been the first to suggest arbitration, and evidently may be safely trusted for some years to come not to endanger their enormously important trade relations with the United States by giving our Government cause to maintain by armed intervention the principles embodied in the Monroe Doctrine. On the other hand, the European Powers, being creditor nations, are naturally more concerned with present conditions than with future possibilities, and if they keep in mind as well their experience in the past they would naturally argue that some at least of the weak republics would be not only tempted, but actually induced, if they were assured that armed intervention would never be resorted to, nor their territory occupied, to defer indefinitely making any payment whatsoever to their creditors, and to increase recklessly the number of private claims and the amount of their public debts. Even so late as 1905 (see page 1,027, Foreign Relations of the United States, 1905)—that is to say, three years after the Drago Doctrine and thirty-seven years after the Calvo Doctrine were published, Mr. Hay, the Secretary of State of the United States, in a communication presented to one of the South American republics, referred to "charges and proofs" that the Executive of that republic had overawed the courts, and had removed and imprisoned judges and attorneys, and had interposed other obstacles to prevent "the due and impartial administration of justice." Even if only one of the weak republics had an Executive of that kind it would be unsafe to concede to them the freedom from restraint that is solicited by the Calvo and the Drago Doctrines. The great Powers are, and always have been, particularly adverse to the undue and partial administration of justice, and that fact was long ago evidenced by the creation of consular courts in non-Christian countries and by alertness in watching judicial procedure in the weak Christian nations. In view, then, of what might be called European prejudice by some and prudence by others, it would seem as if the quickest, surest and best way for our sister American republics to ensure their safety and security would be to exert their influence on one another until every one of them duly selects and elects its President and purifies its system of government so that its Executive, Congress and Judiciary will be efficient and scrupulously careful to perform their respective duties in conformity with its constitution and treaties and with the requirements of international law. When all that is accomplished the Calvo and Drago Doctrines will probably not be considered objectionable, and they may even be regarded as unnecessary. In the mean time our sister American republics should always be ready and willing to trust to arbitration all their financial disputes that cannot be settled thru the channels of diplomacy, and may rest assured that in any controversy which they may have that might be used as a pretext by the European Powers to deprive them of their territory or independence, to change their form of government, to oppress them, or to control in any other manner their destiny, they would be amply protected by the Monroe Doctrine.

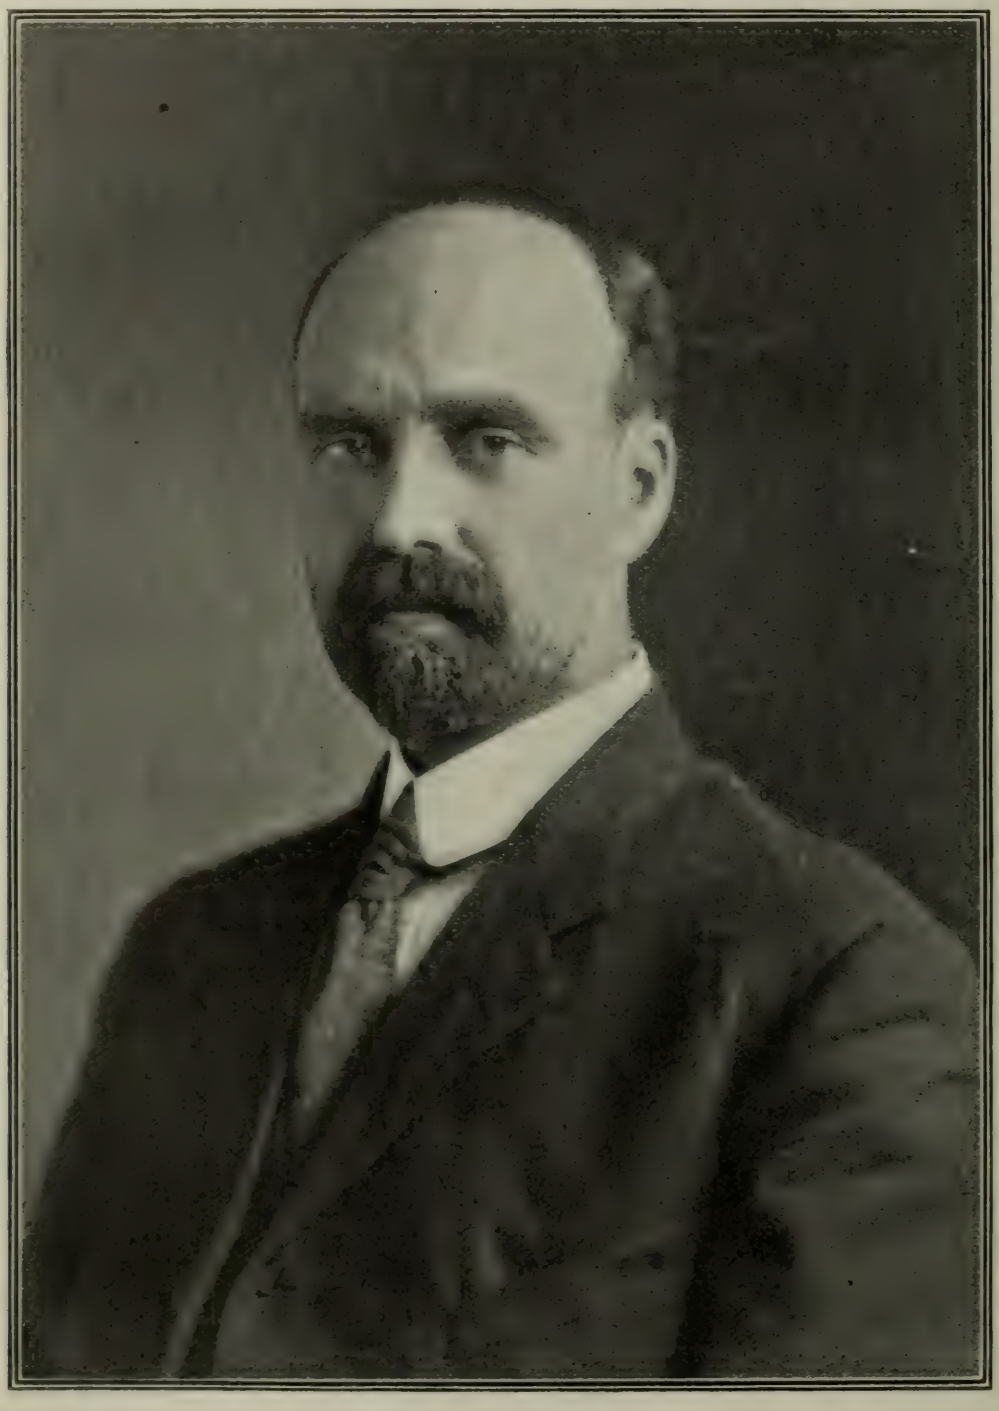
WOODSTOCK, CONN.

Training for Mother-Work

BY ELMER ELLSWORTH BROWN

[The following article by the United States Commissioner of Education is based upon a paper read before the Religious Education Association a few weeks ago at Rochester. —EDITOR.]

FOR reasons which will appear later I am limiting my topic to a very small division of the general field. I shall leave altogether out of consideration the great majority of our American homes, in which the burden of the earliest moral and religious training of the children will rest almost exclusively upon the mother of the family, and concern myself simply with those homes in which a children's nurse or governess is employed. That is, I shall consider the question at first merely as a question concerning the training of nurses for very young children. At first sight it will seem that this is limiting the question to one affecting the homes of the rich. I should say rather that it is limiting the question to one affecting the homes of the rich, the motherless homes and the homes of the very poor; for with the development of a great variety of college and neighborhood "settlements" in our large cities, and with the increasing clearness of educational purpose in institutions for orphans and other unfortunate children, the range of employment for such children's nurses as I have in mind will undoubtedly be very greatly extended. What is proposed is the establishment of schools, or of special courses in universities and other institutions, for the special training of such baby-nurses.



It is one great merit of a vocational school of any kind that it stamps a professional character upon the occupation for which it prepares. By professional character, I mean that ingrained regard for standards and ideas, for special knowledge and special skill, which marks the professional man, and his readiness to put the claims of public service and of intrinsic excellence of performance above considerations of private gain. As compared with any kind of apprenticeship, a vocational school makes for such professional spirit, by combining the instruction of specialists in different fields, by referring processes to guiding ideas and cultivating practice in its connection with theory, by organizing a coherent course of training, by making a center of information relating to recent improvements in its particular craft.

Not only does the school prepare for the vocation more quickly and more thoroly than any ordinary form of apprenticeship, but it tends to improve more rapidly in its methods and appliances. We find encouraging precedents in our training schools for kindergartners and training schools for nurses of the sick. Both of these types of school, and other types undoubtedly, will offer useful suggestions for the new undertaking. If schools for nurses of the sick, which present the closest parallel, have raised the irregular occupation of nursing the sick into something so like a profession, as we have seen them do within the past few years, it seems not at all incredible that schools for the nurses of little children may transform the occupation with which they will have to do within as brief a period.

It is clear that such improvement is greatly to be desired. The baby-nurse of today is ordinarily a servant and often a foreigner chosen because her speech is that of Paris or Hanover. It would seem as if the superficial demand were for the right accent rather than for skill in the care and nurture of the little ones. The real demand is for a variety of knowledge and of judgment.

Nutrition, the prevention of disease, the treatment of minor ailments (for the nurse for the sick must be the main reliance in serious illnesses), the correction of faults of temper and disposition, the first steps in learning, supervision of games, the telling of stories, the first hint of the mysteries of religion—the range of such requirements is very great

indeed. And since the service required is part physical, part educational, part maternal and spiritual, there is no one professional superior who shall guide the practice of the infant-nurse. She is not, like the nurse of the sick, a physi-

ELMER ELLSWORTH BROWN.

cian's assistant and under the immediate guidance of the family's medical adviser. She must take her directions and advice first of all from the parents if they are at hand to direct; but also from the physician, the pastor if there is a pastor, perhaps the teacher, if the family has taken the teacher into such close relations with its inner life, and, most of all, must take counsel with herself and draw on the resources which she has made her own.

No good movement ever had a beginning. No matter where we may start in we find that it is already begun. I have been unable as yet to find notice of any existing institution which exactly fills the rôle which is suggested in this paper. Yet the beginnings have undoubtedly been made. Reference may

be made to the "*Ecole d'Hygiène d'Education Familiale et Sociale d'enseignement ménager,*" which was founded by Mme. Augusta Moll-Weiss at Bordeaux in 1897 and removed to Paris in 1904; the Consultations respecting nurslings (*Consultations de Nourrissons*), conducted by Professor Budin of the Faculty of Medicine of the University of Paris, in connection with the maternity sections of a Paris hospital; the School for Mothers conducted by Doctor Miele at Ghent; the Norland Institute in London; the Liverpool Ladies Sanitary Association; the Training School for Nursery Maids in operation for the past sixteen years at the Babies' Hospital of the City of New York; the Association of Practical Housekeeping Centers; the courses for the training of "kindergarten nurses" maintained by the Young Women's Christian Association.[1]

These are a few of the experiments in this field which have come to my knowledge. Information has been received with reference to a number of other similar experiments, and doubtless many others are in the making, of which I have not yet heard.

It will be found, I think, that the ground is prepared for such an undertaking as has been outlined above. But I believe that what has thus far been done is only in the nature of pioneering, of scouting as it were, and that the real systematic advance is yet to be made. I think it may well be believed that the time for such definite advance is already at hand.

Just what is to be attempted and just how it is to be accomplished are not altogether clear. But these things seem clear to this extent at least, that the training to be given should join theory with practice, and that the work must be partly pedagogical and partly parallel to that of the ordinary nurses' training school. For the purposes of practice, it seems desirable that the student should have access to a babies' hospital, a foundlings' home, a day nursery, or some other institution in which there are children to be cared for. The theoretical instruction can probably best be given in connection with a college or university. The difficulty of working out any standard course of systematic training is perfectly obvious, yet it is no greater than other difficulties which have been met and overcome in the course of our educational development. The problem is accordingly referred to the departments of education and of hygiene of our women's colleges, and of universities to which women are admitted, in the confidence that, like "Sentimental Tommy," they will "find a w'y." I look to see the problem ultimately solved by such institutions as these, in co-operation with hospitals and other institutions for the actual care of infants, rather than in institutions of the latter class apart from colleges and universities, for the reason that the training which is here proposed is educational in its relationships and purposes, and is intended to attract young women whose preliminary training fits them at least for admission to the higher institutions. It may, indeed, be found that the demands of practice will so far outweigh other considerations as to make it appear necessary to conduct all of the courses in connection with the institutions where the babies themselves are to be found rather than in the class rooms of the ordinary college. But none of the effort which may be put forth by institutions other than colleges and hospitals to this same end will be lost. The widest experimentation will be needed; and the labor of the pioneer, in this as in other fields, will be not only necessary but also deeply interesting.

If I have said nothing as yet of the training of mothers, on whom the care and culture of baby children must chiefly rest, it is because such training is particularly difficult to compass by any direct approach. However much young women may look forward, in a wholesome way, to the responsibilties of motherhood, I believe the most of them would shrink from any course of training intended expressly to prepare them for those responsibilities. If such an attitude commonly appears, we may declare it to be unreasonable, but we must reckon with it as a fact. I believe, too, that it is an attitude which finds some justification in simple human nature. It seems to me

[1] Attention should be called to an article entitled, "A Plan for Girls with Nothing To Do," by Elsie Clews Parsons, which appeared in *Charities* for March 4th, 1905

very doubtful whether a course in school or college expressly intended to fit young women to be wise mothers of little children would have much chance of success. But I do believe that a professional course intended to fit young women for the vocation of children's nurse would have a much better chance of success. I believe, indeed, that when such courses are well started they will be largely attended, and that those who have taken them and received certificates or diplomas showing that they have pursued them successfully, will find employment in abundance awaiting them. Still further, it is not unreasonable to hope that when the vocation of baby-nurse or nursery matron or whatever it may be called, shall have become a well established profession, its influence will spread abroad in many desirable ways. Some of these graduates will become teachers of classes of young mothers in college settlements and Young Women's Christian Associations. Many of them will marry and will carry their knowledge and skill into homes of their own. Some young women, already betrothed, will take the course of training with no other thought than that of fitting themselves for the homes that are to be theirs. And it may be that the special course will gradually lead the way to some more general form of education for the life of the home, which may find its place and do a beneficent work in all our schools and colleges for women.

If I have said little in this paper of the religious side of the training here proposed, it is not that I regard the religious side as of subordinate importance. But in these earliest years, it is surely desirable that any over-emphasis of the religious consciousness should be carefully avoided. The simple and sincere suggestion of religious conceptions which may safely be attempted, should be joined with an equally wholesome mental and physical life, which is the best assurance of all right-mindedness in the later years of childhood. By such ways as these, and other ways that may be opened up, let us hope that it may be possible to make some small but significant advance in definite preparation for the part to be played by the home in the moral and religious life, as bound up with the physical life, of these our youngest Americans.

WASHINGTON, D. C.

A Code of Ethics for Lawyers

BY JULIUS HENRY COHEN

[Mr. Cohen is one of the rising young lawyers of the New York Bar, who has already done splendid work in public affairs thru the Citizens' Union and other good government organizations. At a time when the lawyers are receiving a great deal of censure for the work of some of them in behalf of corporations and capitalists, this article is opportune. Moreover, a movement is already on foot in this city to formulate a definite code of ethics for lawyers.—EDITOR.]

IN an address recently delivered at the State Bar Association, Mr. Joseph H. Choate said that when Jeremiah Evarts was considering the law as his profession, he was greatly disturbed by the question whether, as the one side or the other of every lawsuit was necessarily wrong, he could honestly and conscientiously engage in a pursuit in which about half the time he would necessarily be struggling to maintain injustice; and that, after consulting Judge Ellsworth, afterward Chief Justice of the United States, he became satisfied that any cause that was fit for any court to hear was fit for any lawyer to present on either side, and *"that neither the judge nor counsel had the right to prejudge the case until both sides had been heard."*

Mr. Choate then went on to say:

"That, I think, was true of all the functions of the American lawyer in those old days. His relations to the business of his clients was strictly professional, just as much so as that of the physician or the surgeon.

"And so it is today of the English barrister. *Whether he tried or argues a cause, or revisès a pleading or contract, or gives an opinion on the facts submitted, he acts without any interest in the matter, or any relation to it other than the purely professional one.*"

This theory—so strongly advanced—is made the basis of many mistaken notions of the ethics of the profession. It assumes freedom as wide as the heavens so far as intellectual activity is concerned, with moral judgment constrained within the narrowest confines. It assumes that there never exists a case of wrong clear and convincing on one side, with right equally clear on the other; and that, like Justice, blindfolded, the lawyer must always accept his clients' side and advocate it, no matter how false it may seem to him. For—so the theory runs—it is not for him to judge. His individuality is gone once he accepts the retainer, and as his client is his client, he must plead his cause. When the cloak of the advocate is donned, the moral responsibility of the individual ceases. Should it cease? Are the standards correct? The layman thinks not. Is he right and are we wrong? The layman, rightly or wrongly, says (except when he himself is the client concerned) that if the client do wrong, the advocate who advises him how to do the wrong is *particeps criminis*—a perverter of the law. And if he be such, when giving advice *before* the act, how does he stand if he shields and guards *after* the act is done? The receiver of stolen property is equally guilty with the thief, yet it seems strange to the layman that if the receiver be a lawyer and the property only be taken as a fee, no wrong is committed. But, says the lawyer, shall I be judge in my client's cause? His rights *must* be preserved. What rights? The right to escape punishment if he be guilty? Is the lawyer not also an officer of the court, a State's attorney? What of his duty to the State?

The lawyer says: "Yes, but the criminal's rights to a fair trial must be preserved. Who shall protect his rights if I do not? Shall the innocent suffer for the guilty?" Of course not, but shall the *guilty* escape for the innocent? It has come to be recognized as part of the public prosecutor's duty, first to satisfy himself of the guilt of the accused before he indicts. He must shield the innocent as well as punish the guilty. Has his adversary no like duty to the State?

The fundamental question at bottom is this: When the lawyer becomes an advocate (prosecutor or defendant) does he lose his individual moral responsibility for judgment in the case as a man? If he does not, how can he close his eyes to plain facts? May he not *know* that the client's story is false? May he not *know* that his advice to the corporation is to shield it from the consequences of the law? This does not mean that all lawyers who defend persons accused of crime or who represent corporations are themselves in the wrong. The argument relates only to the clear cases. Of these there are, surely, enough. The lawyer may sometimes deceive himself, but he never deceives his client. The surgeon may never commit an abortion, tho the patient retain him for the purpose. He is always a *man*, tho retained professionally as a *surgeon*. May the lawyer commit an abortion for his client? Is he less a man than the surgeon?

Let it be said, therefore, definitely, that while the lawyer shall lend all his strength to shield the innocent, he must not, by a hair's breadth, save the guilty from the consequences of crime or wrongdoing. He shall not be judge in his client's cause, neither shall he be judge in his adversary's cause by shutting his eyes to clear proof of guilt, or, maybe, innocence.

Let it be said, positively also, that when the lawyer leads a public cause, he shall not prejudice that cause by an appearance for interests opposed to it. He becomes a trustee of a cause, when he assumes leadership, a greater trust than any trust of property. He must not jeopardize its integrity.

In a righteous cause the lawyer must fight valiantly; in an unrighteous cause, never. This does not mean that the righteous lawyer is the one always to be found on the right side. There are enough doubtful cases requiring the skilled activity of the advocate to keep him engaged without selling his talents to defend the clearly unrighteous.

Shall a lawyer interpose a technical defense to keep for a client the proceeds of a fraud—the fraud being conceded?

Shall he interpose the statute of limita

tions as against a concededly honest debt? Shall he violate the bankruptcy law—the law of equality—by securing for his client a larger dividend than other creditors receive?

It is well known at the bar that many clients, especially banks, wash their hands of wrongdoing by putting such matters entirely in the hands of their lawyers. So long as the lawyer produces the result, the means give them no concern. Is there no moral responsibility in either place, in such a case? The client suspects, but shuts his eyes. The lawyer knows and holds his tongue. Can he hold his conscience, too? If the State's attorney shall not prosecute before satisfying himself of the defendant's guilt, shall his adversary defend before satisfying himself of his client's innocence?

These are some of the practical questions that daily arise in the lawyer's practice. Many good men are confused. The standards today are not well-defined. Indeed, the purpose of this article is to indicate that the standards of even the best men at the bar are subject to criticism. Is it not high time that the lawyers themselves considered and discussed, as preliminary to its formulation, a Code of Ethics for the Bar? Not one that shall be final for all time to come, like a creed, but one which shall represent the best and highest moral thought of our day, and which shall advance as we morally progress.

NEW YORK CITY.

"Go Singing, Merry Masters"

BY CAROLINE E. MacGILL

LADS go singing on their way
To Cambulo and far Cathay,
Weaving dreams of high emprise
Where cities strange shall meet their eyes.
"Go singing, merry masters."

Gray-head Magi in amaze
Will list and marvel at the strays.
Emperor and mandarin
All vie their gratitude to win.
"Go singing, merry masters."

Tartars were but made to slay.
And China but to point the way
On to farther ventures still,
'Tis o'er the waters, an you will.
"Go singing, merry masters."

What shall stay them, Indies far,
Or lands beneath the Western Star?
Who longs not the coasts to speak
Of golden-sanded Amerique?
"Go singing, merry masters."

Youth sings ever on its way—
"Oh, giants were but meant to slay.
Obstacles the tempter's lure
To lead us on our way more sure."
"Go singing, merry masters."

PITTSFIELD, MASS.

Literature

New Views in Theology

RELIGION is the most perennially interesting of all subjects, because it has to do with the infinite God, the eternal life, and the highest duties and interests of man. The two books considered in this notice have grown out of religious discussions that have attracted the attention of the English-speaking world. Mr. Campbell, author of *The New Theology*,[1] is one of the best known London preachers, and one of the most advanced in his theology. His late utterances have attracted so much criticism that he has written this book to expound and defend his views.

He is a monist, of the variety which pronounces for idealism, and this has colored his teaching. He says that "practically the whole scientific world is monistic," but he does not mean that it is idealistic, for much of it is materialistic. That statement we do not accept, for the dualism which holds to both mind and matter has not yet lost its hold on scientific minds. He further says that there is "no substance but consciousness." Those who will can perhaps believe it. Then he holds to an extreme doctrine of immanence, which he puts in contrast with the divine transcendence, which, he says, usually regards God as "above and apart from this world, instead of expressing himself thru his world." He regards God as the all-inclusive Infinite, of which all things and all beings are a part, just as, if we may venture an illustration, the infinite ether is all inclusive, and atoms of oxygen and carbon are twists or curls in this ether. So man is a part of God, and God is immanent in man, so that, barring the autonomy of free will, all our doing is God's doing; and sin is negative; "evil denotes the absence rather than the presence of something," and we might say rhetorically that "the Devil is a vacuum"; for "good is being, and evil is not-being." Why he calls good the substance and evil the vacuum, and not the reverse, is not clear, for to one's consciousness evil, suffering, sin, are quite as positive as their opposites. The larger part of the volume applies the doctrines to sin and atonement, and much of it is excellent in its teaching, while much of the language is difficult to follow. He is fascinated by the "subliminal," and the newer "psychic" investigations, and expects that science will prove the immortality of the soul, that is, of separate consciousnesses, which is all there is. We take it that God also is simple consciousness. Mr. Campbell is not troubled by any trammels as to the Bible, and is ready enough to accept mythical elements in the New Testament as well as the Old, but as to our Lord's resurrection he is orthodox enough, except that his doctrine of consciousness as the only existence makes it seem easy to him to put resurrection into the terms of ideology, so that the resurrection will have as much realism to it as anything has. We admit that to the common mind, untutored in the mysteries of fourth dimensions, the philosophy of the books adds no help to religion and no clarity to theology, but Mr. Campbell may satisfy many to whom it seems to add something to tell of immanence as bringing us closer to God than does omnipresence, who hold that God can "express himself thru his world" better if he is the world than if he made the world.

Sir Oliver Lodge's *The Substance of Faith*[2] is the development into a volume of his lately printed "Catechism for Parents and Teachers," by prefixing notes of explanation. The Catechism attempts to put religious belief into terms not inconsistent with modern science. It has a good deal more to do with natural religion that historic Christianity. It is religious in that it assumes God, and the evil of sin. Out of "the records and traditions of the past" it discovers "a loving Father," whose "divine nature is specially revealed to man thru Jesus Christ our Lord," who died "in Palestine nineteen hundred years ago, and has

[1] THE NEW THEOLOGY. *By R. J. Campbell, M.A.* Minister of the City Temple, London. 12mo, pp. ix, 258. New York: The Macmillan Co. $1.25.

[2] THE SUBSTANCE OF FAITH ALLIED WITH SCIENCE. A Catechism for Parents and Teachers. *By Sir Oliver Lodge*, Principal of the University of Birmingham. 12mo, viii, 144. New York: Harper & Brothers. $1.00.

since been worshiped by the Christian Church as the immortal Son of God, the Savior of the world." So it teaches a future life, "in a higher or lower form."

In the notes on the Communion of Saints there is, as might be expected, a touch of telepathy, and the author anticipates discoveries which will prove the continued existence of the disembodied soul. That his idea of an immanent God is also that of a personal God is made happily clear on page 95, from which we quote:

"The most essential element in Christianity is its conception of a human God, of a God, in the first place, not apart from the Universe, not outside it and distinct from it, but immanent in it; yet not immanent only, but actually incarnate, incarnate in it and revealed in the Incarnation."

But this incarnation does not mean Jesus. By incarnation he apparently means personality; for he continues:

"The Christian idea of God is not that of a being outside the universe, above its struggles and advances, looking on and taking no part in the process, *solely* exalted, beneficent, self-determined, and complete; no, it is also that of a God who loves, who yearns, who suffers, who keenly laments the rebellious, misguided activity of the free agents brought into being by Himself as a part of Himself, who enters into the storm and conflict, and is subject to conditions as the soul of it all."

The Netherlands

THE author of "The Woodcarver of 'Lympus" went with her kin and her man to the land under the sea level to study the people leisurely. The result is a pretty book[1] which tells as much about the author and her James as about the people in wooden shoes. From her comfortable Dutch environment she sallies forth with James to see the sights, enjoy the art, and participate in the social functions. She has her fun with the language, but she enjoys it, and she has opinions of her own. Furthermore she knows her Rembrandt unusually well. Altho Holland has the three greatest pictures of the son of Leyden, "The Watch," "The Syndics" and "The Anatomy Class," she does not forget the works of the miller's son at Cassel and Dresden. In her eyes the traditional portrait of "Rembrandt's Father," with feathered cap and armor, is the supreme exemplar, or rather expression, of the man Rembrandt and his art. That is, this picture represents the face of Rembrandt himself, neither the old, nor the joyous, neither the gay nor the thoughtful Rembrandt of various ages and experiences, but a composite of all the pictures in the famous collections. We note this, as well as her description of Easter in the church at Scheveningen, as specimens of the author's powers of independent analysis and judgment, showing her far above the average of observers. Tho her knowledge of history is not particularly striking, her insight into human nature is quick and deep. The pictures, after Lalanne and others, are by A. Montferrand. That of William the Silent is from one of the very few portraits painted during his lifetime.

What in the eyes of some Dutchmen was "the source of woes unnumbered" to the Netherlands—the matrimonial alliance of a stadholder with a Stuart princess—is the subject of a new Iliad[2] from the pen of one who handles freely, and not without an occasional piquant savor of maliciousness, some famous reputations. The period covered begins the decade before the great peace at Münster, which the triumphant republic after the Eighty Years War made with humiliated Spain, and ending with the seating of the Prince of Orange on the throne of England under the title of William III. It covers also the "stadholderless period," when the Orangeists and anti-Orangeists struggled most intensely for the possession of power. The theme is handled by one who not only knows well her authorities, but is able to control them. In all devious matters she walks hand in hand with the great investigator in Leyden, Robert Fruin, a critic who in grasp and insight was, during his adult lifetime, perhaps, without a peer. The matchmaker who united the houses of Holland and England was the ex-queen-regent, Mary of Medici, widow of Henry the Fourth of France. Having failed both as queen and mother, and driven out of France by Richelieu, she resolved

[1] THE GATES OF THE NETHERLANDS. *By Mary E. Waller.* Boston: Little, Brown & Co. $3.00.

[2] COURT LIFE IN THE DUTCH REPUBLIC. (1638-1689.) *By the Baroness S. van Nyeveldt.* New York: E. P. Dutton & Co. $4.00.

on one mighty stroke of policy before shuffling off her mortal coil. Tho she was received with festal welcome in all the Dutch cities, and with spectacular demonstrations, such as the Dutch to this day enjoy with vim, the States-General thought it good riddance to bad rubbish, when, under convoy of two men-of-war, she was sent to England. Few could then foresee what she was likely to accomplish. Baroness van Nyeveldt describes with a firm touch because of her intimate knowledge, The Hague as a diplomatic center and its social life, the youthful suitor, William the Second, the family life in the Nassau and Palatine families, religious influences, literature and art. It is refreshing to read domine (instead of the Scotticism dominie), Tromp in place of "Van" Tromp, and to enjoy the delightful absence of other British caricatures of things Dutch, which disgrace the average book in English on Holland; but "stadtholder" for stadholder, power-holder or lieutenant, is probably a printer's slip. In her portraiture the author has a free pencil. Amalia van Solms, the widow of Prince Frederick Henry and mother of the young suitor, William II, suffers considerably at the hands of this new limner of her moral features. Without dwelling on "Amelia's" goodness and energy, she shows her chiefly as one eaten up with family ambition. The mutations of politics in England were registered like the ebbing and flowing tide at The Hague. Between the followers of the beheaded king, proud exiles, hungry and hopeful, who were given to wine or assassination, according to their mood, and the iron-handed Cromwell, the republic did not win much happiness from the marriage of the pretty but insipid Stuart princess with the grandson of William the Silent. On the whole this is an admirable historical study. The work has an indirect value to Americans familiar with the struggle of Great Britain and France for the possession of the North American continent, since it illuminates the springs of history during the seventeenth century, when the activity of the French in Canada fed the hopes and fears of English settlers from Massachusetts to the Carolinas.

The Rise and Decline of the Netherlands[3] is an expository sermon on the necessity of forming an organically united British Empire with a written constitution. "Great Britain stands still, and appears to be rapidly sinking to the rank of a second-rate Power in strength and wealth." Meanwhile, Germany and the United States, which are younger nations and highly organized federations, are advancing with giant strides. The English must avoid the mistakes of the Dutch, who, from the days of the Great Privilege, in 1477, held only the parochial ideas of local political magnates, knew not the meaning of the word nation and limited their vision by the boundaries of their parish and the walls of their shops. In all their constitutions, until they fell under Napoleon, the political disease of Holland was lack of a sufficient central authority. Great Britain and the British Empire, at present misgoverned, unorganized and chaotic, must unite in imperial federation, with a written imperial constitution, or go the way of the Netherlands.

This is the theme which, with a hundred variations from a re-reading of Dutch history and manifold illustration, Mr. Barker renders on his instrument. He has read well and pondered long Plato, Aristotle, Machiavelli, and the old English and American writers on the Netherlands. In spite of his unconvincing articles in recent periodicals, he does not seem to know the modern politics or spirit of Holland. He quotes liberally from the old original Dutch authors, but knows not Fruin, Colenbrander, or those Dutch publicists who would read with somewhat less bias and less vehemently and without the set purpose in view which a partisan Englishman has. Despite his claims to originality and freshness (pages 6-9) many pages have an antiquated air. On page 181 we read an echo of Freeman, "the confederation of the United States, which suffered shipwreck in the War of Secession." Thruout we hear not of a Dutch republic, but invariably of a "democracy"! On the whole, a vigorous, suggestive book. Despite the author's limitations, it provokes thought.

[3] THE RISE AND DECLINE OF THE NETHERLANDS. *By J. Ellis Barker.* New York: E. P. Dutton & Co. $3.50

Hans Breitmann

MRS. PENNELL has written a sympathetic and delightful biography of her uncle, Charles Godfrey Leland,* and in it has given valuable pictures of student life in America in the forties, and journalistic and literary life in the sixties. A graceful writer of unerring taste, she has chosen such incidents and such an arrangement for her work as makes the whole a series of essays, interspersed with letters of interest and charm. She has not hesitated to give to her own part in the pages the personal touch from which most biographers hold themselves sedulously aloof. It is a method which explains her attitude toward the topic, and while she never obtrudes irrelevant matters it lends life to the simplest statement of fact.

Mr. Leland limped thru the years of school and college, his mind not being of the sort that took kindly to a set curriculum. He was by nature a rover, and tho without a creative quality he was yet of an originality that led him always into the odd corners and byways of the world's interests. After graduation from Princeton, a feat at which the reader marvels, Mr. Leland followed a somewhat desultory course of study in Germany and in Paris, writing home joyous letters full of German beer and French Revolutions. At the opening of the war he was sufficiently established to take a notable part as an active and useful Northern journalist.

Mr. Leland might have remained a powerful worker in this first field to the end of the chapter had he not soon after the close of the war been left independent of any return from his pen. The "Hans Breitmann Ballads" had made him well known. Their delicious mixture of German pretzels and English philosophy was just the sort to tickle the American sense of humor, and his fame preceded him to England, where he met a warm welcome. For playmates he had all the noted literary folk of London, and for work, the following of his favorite study, the life and language of the Gypsy. There is nothing more enjoyable in Mrs. Pennell's two volumes and no truer picture of the real craftsman of any trade, than is to be found in the chapter dealing with the preparation of the "Gypsy Ballads." Mr. Leland had in perfection the seeming laboriousness of the artist, and now, free to do as he chose, he but turned the industry of the newspaper editor into making notes on Romany, or on any other topic that absorbed his attention. He is a fine example of that brave doctrine that ruins some lives, but is responsible for most successes, the choosing for work what one most enjoys.

Back in Philadelphia in 1879, Mr. Leland found an opening for the introduction of what he terms the "minor arts" into the public schools, and he threw himself into the heavy labor of this now widespread movement for manual training with all the ardor that he had given to his Romany studies. The year 1882 found him on the Massachusetts coast, near a camp of the remnant of the Algonquins. On the alert for folk-lore, he spent his days in winning from these taciturn people their fading traditions, which later were woven into his two books, "Algonquin Legends" and "The Kadoskap."

The later years of his life were spent for the most part in Florence, where, beginning by a curious acquaintance among the fortune-tellers, he became engrossed in a search thru their strange lore for fragmentary memorials of the lost Etruscan tongue, a search that attracted that wilder and more wonderful genius, Burton.

Mr. Leland's wayward fancy brought him for preservation such treasures that the brilliant journalist and witty verse writer were well lost. The fascinations of the Gypsies made him the Romany Rye of America, standing beside Borrow of England. The Gypsies led easily to the Tinkers, in whose lingo, Shelta, live traces of Erse and Gaelic. The basket weaving Indians of a summer watering place gave into his keeping the well-nigh lost traditions of their people.

A genial figure is here painted, egotistic, to be sure, but that is a forgivable foible in one so kindly, and always interesting. As shown to us by his niece, his was one of those rare and enviable natures in which youth, fed by vivid intellectual interests, is immortal.

* CHARLES GODFREY LELAND. *By Elizabeth Robbins Pennell.* Boston: Houghton, Mifflin & Co. $5.00.

Midsummer Madness. Translated from the Spanish of Emilia Pardo Bazán, by Amparo Loring. Boston: C. M. Clark Publishing Co. $1.50.

The author of this light love story of Spanish life is a decidedly remarkable woman. In addition to writing fifteen novels, she has translated numerous works of French and Russian authors into her own language, and also edited a critical magazine for a number of years. The English translation of *Midsummer Madness* is well rendered, and follows the Spanish form of conversation with great conscientiousness. Of plot and counterplot there is very little. The story tells of a gentle flirtation, occasionally verging on the dangerous, and always inclining to the superficial. The book is readable, however, while not elevating. The best feature is the minute detail with which the story describes the everyday life of the characters, both nobility and peasantry. The account of the fair at Saint Isidro, with its happy crowd, gaudy decorations and extravagant enjoyments, gives a good picture of Spanish life. The translator's name usurps the place of the author's on the cover and title page.

Beached Keels. By Henry M. Rideout. Boston: Houghton, Mifflin & Co. $1.50

Of the three tales contained in this volume, the scene of all of them laid on the Atlantic Coast where Maine joins Canada, the first is a romance, the second a tragedy, the third a wistful comedy of life as we know it all, whether the scene be laid in a remote fishing village, or in the busy marts of men. Mr. Rideout has talent, sincerity of purpose, and an ambition that strives for something higher and more enduring than mere popularity. He is also well equipped for his chosen career, but his very aspiration, scorning easy success, indicates that his progress will be slow and laborious; that, while the approximate perfection at which he aims lies well within his scope, he will have to labor harder for it, and longer, than many another to whom fame comes overnight. Already he has achieved much. The bleak, niggardly, hard New England background is there in his pages, and it is reflected in the taciturnity, the stoicism, the rugged, enduring strength of his fisherfolk. His pen is sensitive to effects of nature, to a desolate shore in midwinter, the smile of sunshine on the sea in spring, the picturesqueness of lights glinting in midnight darkness. His fancy is fertile and it imagines large canvases. He almost fills them, but not quite. It is in dealing with the emotions of his characters in the powerful situations in which he places them that Mr. Rideout still falls short: he leaves a little too much to the collaboration of the reader.

The Humanists' Library. Edited by Lewis Einstein. Thoughts on Art and Life, by Leonardo da Vinci, translated by Maurice Baring. Boston: The Merrymount Press. $6.00.

Mr. Updike of the Merrymount is timely in launching his *Humanists' Library,* for there are many signs of the times to indicate that, if we are not at the dawn of a new Renaissance, we are at least approaching a somewhat similar "mutation period," to use De Vries's phrase. The evidence of this is found, not so much in the attempted revival of classic education and the open defense of neo-pagan morality, as in that converging of scientific, religious and artistic movements, which already has received the name of "the new humanism." It is especially fitting that the *Library* should begin with Leonardo, because he in his multifarious interests and comprehensive mind comes as near as any one to representing the Superman whom we may expect to result from this union and cross-fertilization of art, philosophy and science. In the narrow literary use of the word Leonardo was no humanist. As he says in the volume before us:

"I am well aware that, not being a literary man, the presumptuous will say that I cannot find true expression for the matters of which I desire to treat; they do not know that in my subject experience is a truer guide than the words of others, for experience was the teacher of all great writers, and therefore I will take her as my guide."

His notebooks from which the extracts here published are taken make fascinating reading from their mysterious glimpses of deeper meanings, paragraphs purposely enigmatical, curious speculations and shrewd anticipations of discoveries that the centuries since have verified, frag-

mentary, unfinished and fruitless like his work as an artist. The only fault we find with this edition is that it lacks the annotation so much needed in such a work. There are many passages obscure in the translation without more knowledge of the technical, metaphysical and scientific terms current at the time and of Leonardo's peculiar mode of thought and expression than even the scholarly reader usaully has. *The Humanists' Library* is beautifully printed "in a new font of Montallegro type," which has the remarkable merit of being readable as well as novel and artistic. The edition is limited to 303 copies for America and England, of which 275 are for sale. The succeeding volumes of the series are Erasmus' "Against War," Pierre de Nolhac on "Petrarch and the Ancient World" and Sir Philip Sidney's "The Defense of Poesie, a Letter to Queen Elizabeth and The Defence of Leicester."

How to Appreciate Music. By Gustav Kobbe. New York: Moffat, Yard & Co. $1.50.

America's greatest artistic need today is instruction in appreciation, and in all the realm of art this need cries loudest in the domain of music. We have a deal of music, good, bad and indifferent—and most of us don't know the difference. Our deplorable and disquieting lack is in the education of intelligent listeners to music. Hence any work that tends to make good music popular, or to stimulate interest in it, is worth while. This is Mr. Kobbe's aim. His book is not a technical treatise. It is addressed to those who do not know or understand much about music, but who would like to. His purpose is to equip the lover of good music of all kinds with the knowledge which will enable him to enjoy far more than before any performance he may hear. Contrary to the belief of the musically ignorant, good music is not forbidding or difficult of enjoyment, and Mr. Kobbe is right when he says: "If you can read and listen, there is no reason why you should not be more musical—a more genuine lover of music—than many of those whose musicianship lies merely in their fingers or vocal cords." Avowedly "popular" in intent, and even at times a bit careless in style, the book contains a deal of gossipy chat about musicians, but at the same time its exposition of the classical forms—the sonata and the symphony—and thru the latter the development of the orchestra is made equally interesting. More than half of the book is devoted to telling "How to Appreciate a Pianoforte Recital"—because, as the author says, of all instruments the pianoforte is the most intimate and the most public, and it would be difficult to overestimate the debt music owes to it. An outline is given of the development of music from the most primitive forms to the elaborate classical compositions in which form dominates feeling and thence to the modern or "romantic" music in which feeling dominates form. Mr. Kobbe is in sympathy "with the liberating tendencies of modern music which lay more stress upon the expression of life and truth than upon the exact form" of that expression, and he preaches the gospel of modern music in no uncertain accents. One of the most interesting and most valuable parts of the book is a translation (the first to be published in English) of excerpts from Richard Strauss's treatise on orchestration—issued as a new edition of Berlioz's monumental work, but practically rewritten by Strauss, himself the greatest master of the art of orchestration who has ever lived. Mr. Kobbe also devotes a separate chapter to Strauss and his music.

Edward H. Rollins. A Political Biography by James A. Lyford. Boston: Dana Estes & Co. $1.50.

This is a good example of the political biography. The political activities of New Hampshire, which State Rollins represented in both Congressional houses, are here set forth in sufficient detail to make the book of interest as a study in that field. But it chiefly aims to set Senator Rollins, an able, conscientious, useful man rightly in history. He was a party man of the better type, believing he could do more good by working in and with the party than outside and against it. He could and did sacrifice and he justified his ambitions. The stormy period of the war and the treacherous period of reconstruction and the greenback vision in National affairs and further, in State matters, the strife for

prohibition and the labor movements developed him as a strong leader, "machine man," contemporary with John P. Hale and Wm. E. Chandler.

Literary Notes

....Those who were interested in the One Hundredth Anniversary of the Haystack Prayer Meeting last October will be interested in the recent volume of the *Proceedings* of the A. B. C. F. M., published by the Board at $1.20 net.

....President Hadley, of Yale, in his more serious talks to the undergraduate body, has had an influence, not usually exerted by college presidents. Altho much of the success of the addresses were due to the personality of the speaker, their collection into book form makes an interesting and important volume. [Baccalaureate Addresses. Scribners. $1.00.]

....The well known qualities of Prof. John F. Genung as a writer on Old Testament themes—indifference to critical analysis and ability to find consistency where others see great divergence—are manifest in his third volume on the Books of Wisdom, *The Hebrew Literature of Wisdom in the Light of Today.* [Houghton, Mifflin & Co. $2.]. The book is called a "Synthesis," and includes studies of the Discourses and Parables of Jesus and the Epistle of James, as well as of the canonical and apocryphal Wisdom books more commonly so called.

....There are more of Ibsen's plays now on the American stage than ever before at one time, and the revival, or rather the awakening of interest in him is shown also by the number of books on Ibsen which are now being published. Among the latest is *Ibsen, the Man, His Art and His Significance,* by Haldane Macfall. The author, a devoted Ibsenite, considers the plays in turn and interweaves the main details of Ibsen's life, but his style is jerky and turgid, and he has added nothing of importance to our knowledge or comprehension of Ibsen. The book is artistically printed by Morgan Shepard Co., of New York and San Francisco.

....President Thwing, of Western Reserve University, has finished his *History of Higher Education in America,* which is to be a part of a larger work, "A History of Education" of all grades in this country, which will be awaited with interest. The present volume is a full presentation of its subject, and in the main summarizes the results of twenty-five years' work in collecting material in well-considered and valuable form. One of the most interesting chapters, since it is a new chapter of education itself, is that upon "The Education of Women," written in a spirit of fairness toward co-education, not always found in treatises of this kind. In comparing the universities of the "New World and of Old England" in the eighteenth century, Dr. Thwing says: "It is not a comparison, it is a contrast. This contrast, it may as well be said at once, is to the advantage of the new institutions of the New World. Never had Oxford and Cambridge sunk to a lower level"; and our own young colleges made up in enthusiasm for learning whatever they may have lacked in equipment. Adam Smith and Edward Gibbon, among others, savagely criticised the Oxford of their day. The rapid rise which the English universities made in the nineteenth century it may be our good fortune to parallel in the twentieth. Dr. Thwing is hopeful that we may. [Appleton: $3.00.]

Pebbles

ONE day the office boy went to the editor of the *Soaring Eagle* and said:

"There's a tramp at the door, and he says he has had nothing to eat for six days."

"Fetch him in," said the editor. "If we can find out how he does it we can run this paper for another week!"—*Exchange,* quoted in *The Christian Advocate* (New York).

SUBLIME MORTIFICATION.

A MAN once watched some laborers
Mix sand and lime and water,
When, happening to stumble, he
Fell headlong in the mortar.

The mixture disarranged his hair,
And hardened on his face.
"Alas! How mortarfying," he
Observed with a grimace.

It chanced some calcareous earth
Was emptied on his head.
"Instead of being mortarfied,
I'm now sub-lime!" he said.

—*Yale Record.*

SHAW ON PEACE PILGRIMAGES.

MR. STEAD has received the following letter from Bernard Shaw in regard to Mr. Stead's plan for a peace pilgrimage to The Hague:

"10 ADELPHI TERRACE, LONDON, W. C.,
"ST. PATRICK'S DAY.

"MY DEAR STEAD—I have never heard a more unreasonable proposal.

"Here, on the one hand, is a small body of persons of international importance, whose time is the most valuable time in the world and whose energies are already overtaxed with the work that lies to their hands at home.

"There, on the other hand, you have a handful of merely local people, kings, czars, kaisers and the like, whose time is of no value at all and whose profession it is to take part in local pageants and international demonstrations.

"Surely it is for the latter, not for the former, body to undertake this pilgrimage.

"If you will readjust your project in this obvious way I shall be most happy to receive any monarchs you may induce to visit me at the above address. I shall do my best to put them at their ease and I will ungrudgingly give them as much good advice on the peace question (or any other) as they may feel disposed to receive. "G. BERNARD SHAW."

Editorials

The Political Situation

Two or three prominent newspapers have undertaken to measure public sentiment thruout the country concerning President Roosevelt by addressing politicians, editors and other observing persons. The testimony thus obtained is, in brief, that the President's popularity was never greater than it is now. It has not been diminished by the Harriman correspondence. It appears to have been augmented by the wide publication of the story about the reactionaries' plot to defeat his policies and to prevent the nomination of any candidate who represents them. The effect of the authoritative White House disclosures as to the President's conviction that there is such a plot has been favorable to his purposes. In several States the legislatures have adopted resolutions (rarely with any dissent) commending him and his projects of legislation. In some instances the resolutions have called for his renomination.

He has also been fortunate in the records and political affiliations of those who are publicly opposing him and his aims. Mr. Foraker is generally regarded as a representative of the reactionaries. His record in the Senate and in his own State tends to support this popular estimate. Mayor Reyburn, of Philadelphia, whose election was a victory for the forces which the reform movement temporarily overcame, and who is a follower of Senator Penrose, seizes the opportunity to place himself with the reactionaries. When Henry H. Rogers, of the Standard Oil Company, says in one of his very rare public statements that he believes "that the sentiment of the country will have so crystallized within a few months that there will be a practically united demand for the strongest conservatism in the conduct of the Government," this is pointed out by the intimate friends of the President as a reactionary utterance which indicates the attitude of all whom Mr. Rogers represents.

An eloquent Southern Democratic orator suggests in all seriousness at a banquet where Mr. Bryan is the guest of honor that in the Democratic National Convention Mr. Bryan should "put in nomination Theodore Roosevelt for one more undisputed term of power to finish the work he has so gloriously begun," and Mr. Bryan does not positively refuse to do it. Among the leaders of the Democratic party there appear at the same time sharp differences of opinion as to Mr. Bryan's plan for the Government ownership of railroads, and it is quite clear that the party cannot become united in support of the foremost policy of the man to whose candidacy for the Presidential nomination there is at present no organized opposition. There is evidence that many Democrats would vote for Mr. Roosevelt if he were a nominated candidate at an election to be held this week.

But he will not be a candidate. We have taken him at his word. We see no reason to believe that he thinks of changing his announced determination. Newspaper men who are said to enjoy his confidence are now asserting that he was never more firmly fixt in his purpose to decline and to prevent a renomination of himself. It is even said that he thinks he could not be re-elected. If this is true he is deceiving himself. Can he transfer his immense popular political strength, or a sufficient part of it, to another candidate of his own choice?

The President prefers Secretary Taft. This has been quite well understood. If convincing evidence be needed, it can be found in the statement published on the 10th inst. by Congressman Longworth, his son-in-law, who said:

> "The great question before the people in the next Presidential election will be, in my opinion, the approval or disapproval of Republican policies as registered by the legislative and executive branches of the Government for the last seven years under the administration of President Roosevelt. It seems to me that after the President himself there is no living man who so thoroly typifies, in the eyes of the people, the spirit of the Roosevelt administration as does William H. Taft. There is no one who can better be trusted to carry out many

of the great reforms which will necessarily be incomplete upon the retirement of President Roosevelt."

But is it true that in the public mind Secretary Taft typifies the spirit of the Roosevelt administration with respect to those policies which are most prominently and distinctly associated with Mr. Roosevelt's name? In asking this question we do not mean to overlook or belittle any part of the Secretary's good record, or to say that there is any other man who can be regarded as a more competent and sympathetic understudy for Mr. Roosevelt. But it does not seem to us that the public thinks of him as being identified before the people with the President's labors for the regulation and restraint of great corporations and corporate wealth. It may be however, that his attitude toward this, the great domestic question of the time, is like the President's, and that his earnestness in support of the President's views would be as great as the President's has been, if conditions demanded such devotion. It must be remembered, of course, that the Secretary has had important duties in other fields.

We have spoken thus of the public estimate of Secretary Taft not as expressing an opinion that he would fail to support vigorously the policy of Mr. Roosevelt concerning railroad companies, other great corporations and the business use and power of enormous wealth, but to point out that really no one who has been mentioned as a candidate for the nomination stands before the public as a known and vigorous representative of that policy. Probably the requirements are met by Mr. Taft more nearly than by any other who is in the field.

All this is so because the President's personality has so dominated the situation, because his influence upon legislation has been so great, because the legislation which to some extent represents his policy is so largely his own work, and because executive action in exemplification of that policy has been so largely due to the constant exertion of his influence upon his subordinates. He has left no room for any one to grow up in rivalry with him or in imitation of him in the field to which we refer.

For this reason his determination to retire—but also to lead and to work as earnestly as ever until the end of his term—is a cause of much political uncertainty and disturbance. Of one thing we may be sure, however, and this is that a great majority of the Republicans, and of the entire people, desire that the work he has begun shall be carried forward, and will strive to place in the White House a man who agrees with him as to the policies of which we have spoken. The reactionaries can neither elect nor even nominate a man of their own kind.

Our Cuban Policy

On March 29th President Roosevelt issued an executive order calling for a general election for the choice of a popular branch of the legislature by all the people of the Philippine Islands except the Moros and non-Christian tribes. This he did on the report of a commission certifying that for a period of two years following the completion and publication of a census of the Philippines a condition of complete peace had existed. That is what we did for the Philippines, and our much traveled and wise Ulysses of the Cabinet expects to go to Manila to be present at the opening of the first Philippine Congress.

Something like that the same Secretary Taft, under direction of President Roosevelt, has announced is to be done in Cuba. To be sure, we do not own Cuba, but we do hold it and govern it temporarily. We are responsible for its peace, and we have promised to restore Cuba to its own people just as soon as it can safely be done. The course to be pursued is the same as in the Philippines, but with less delay. First there was a commission, consisting of three Americans and eight Cubans of different parties. Then it was agreed by this commission, and declared by Secretary Taft, that there must be a census, which shall give a registration of lawful voters. This census is to be taken under American supervision, and will probably take at least four months, and then the registry lists are to be carefully scrutinized. Soon after that census and registration are completed there is to be a preliminary

election, in connection with which provincial and municipal elections will be held. This election is, in part, to test the tranquillity of the island. There is no waiting two years, as in the Philippines, for the United States honestly wants to get out of Cuba as soon as possible. The local elections were necessary, because the previous local elections were tainted with violence and fraud, and these elections will be under impartial supervision. After these local elections, Secretary Taft will have the people of Cuba tested for not more than six months longer, to be assured that the island will maintain peace, and if all goes well the valid election for choice of President and Congress will be held, and the inauguration of a new President may be hoped for in the summer of next year, after which the American troops will be withdrawn as soon as possible.

This conclusion seems to please every one. It allows a fair period to settle whether Cuba is prepared for peaceful self-government. It assures Cuba and the world that the United States proposes to keep its word and really withdraw as soon as it can. The outside world did not believe us. Nations do not usually let go of so precious a treasure as the Pearl of the Antilles if once they get their hands on it. Hitherto nations that have promised to withdraw have somehow managed to find it impossible, unless, as in the case of Manchuria, rival claims made it necessary. And yet this is a fateful warning to Cuba. If its people really want to be and remain independent they must meet the necessary conditions. We are under obligations to see that peace is preserved. We are responsible for it to our own citizens and to the world. We gave Cuba her first independence. She lost it by the political disturbances and intestine war that followed an election, and we were obliged to intervene. Now we give her a second chance, but there will be no third. A distinguished scholar says we ought to be willing to intervene a thousand times, if necessary, because, under no circumstances do we want Cuba a part of the United States. He says that the Philippines are to remain a governed colony, but that Cuba would have to become a State, and that the people are not fit for it and cannot be made fit to help govern this great country in our Congress. We utterly differ from him, and for two reasons. One is that it is not necessary that Cuba should become a State. It might be made, not a colony, but a Territory, and remain such indefinitely. The other is that it is dishonoring to human nature to assume that any people, no matter of what race or tradition, cannot, under influences of education and liberty, become just as fit to take part in self-government as are Anglo-Saxons and Anglo-Celts. For this faith we stand, and because of this faith we demand that Porto Rico be made a Territory instead of being governed as a colony. Some people seem to think that, because so many of the Cubans are of mixt negro blood, they cannot be decently civilized. It is a false doctrine. It was these men that achieved the deliverance of Cuba from Spain by doing the chief fighting for independence. They are a turbulent lot, but they have in them good physical and intellectual material, and they constitute a principal party in the island. If the people are not yet ready for stable conditions, the United States will next time take and hold Cuba permanently, and we hope that the Cubans will understand it. If they will fight, it means that they wish annexation.

The Noisome Trial

WHILE the daily papers were perforce filled with the reports of the noisome trial we have given it not a word. We did not care to spread any more foulness over the social atmosphere. It has been a moral pestilence, and has set people to talking and thinking of crimes that it were better that only the duly appointed scavengers should know of. Just as reports of lynchings suggest lynchings elsewhere, so reports of social crimes besmirch the mind. There is no condemnation too severe for those journals which found no details too prurient to publish.

But now that the trial is over some comments may properly be made. While we are under no obligation to believe the improbable story of her dishonor which Mrs. Thaw told her husband, it is yet clear that the character of the man who she says betrayed her, no less than that

of Mr. Thaw, must have been known to their intimate associates; and such men as they, who haunted the theaters to seduce young girls, ought to have been shunned by all decent men, in business or in clubs. And yet men who knew one of them well treated him with honor because of his ability and taste, associated with him in work and pleasure, knowing how corrupt he was. The story of his violence we do not need to believe, but the near presence of such a life should be avoided as a pestilence. Here were two men of wealth, one a genius, and the other not quite an imbecile, and both equally using their cursed wealth to purchase costly vice. Such wealth is viler and more mischievous than the foulest slums.

The English papers are quoted as contrasting the American methods of trial with those in their country, much to the advantage of their own. They say that in an English court of law the trial would have ended in a week. Possibly, and possibly in two days in France, and possibly in half an hour in Russia. Perhaps we are too careful to protect the accused, and we give him over-many chances. But it is an error which, if it sometimes defeats or delays justice, yet leans to mercy's side, and we prefer it to that kind of justice which seems to assume the accused to be guilty, and fails to give every protection to what may be innocence, while it may be guilt.

We do accept foreign criticism of the frothy, foaming rhetoric of the defendant's advocate. But it is not characteristic. Mr. Delmas was an imported Western orator. He belongs to a period which we have past. He was as much criticised here as in London. Such eloquence may yet be admired in San Francisco, or in Mississippi, but not in New York. Mr. Jerome's address to the jury was not of that order. It was simple and direct. It had no decorations of florid gingerbread work, and those London editors were misinformed who gathered that he followed Mr. Delmas's example. Let it be understood that oratory with us is just as simple as anywhere else, while perhaps more fluent than the transatlantic critics are accustomed to.

Nor do we see evidence in this trial that American vice, among rich or poor, is any more flagrant or dominant than it is abroad. We could balance this dirty case with cases as dirty in England, if we cared to, but it is a sort of pre-eminence as to which we would make neither boast nor disclaimer. We are bad enough, and are ashamed of it, and we would not claim to be better, and we do not believe we are worse, than England and the Continent. As to the rude crowd that followed the witnesses in the case, we admit that it was bad manners, almost as bad as that which has given the language the new word *mafficking*.

As was generally expected, the conclusion was a mistrial, seven of the jury standing for conviction of murder in the first degree, and five for his release as innocent, on the ground of insanity. We suppose that Mr. Jerome's chief technical blunder was in insisting during the trial that Mr. Thaw was insane, and thus encouraging the idea in the minds of the jury. And yet we are not sure but that he did right, for it would seem that he believed it, on the word of a distinguished alienist. What he did in this matter he appears to have done honestly, but it injured his cause in the end, for the commission declared the defendant sane for all legal purposes; but the impression of insanity could not but remain with the jury. But Mr. Delmas did not seek acquittal on the ground of insanity, but plainly on the Western and Southern doctrine, too much prevalent here also, of the "unwritten law." He justified the passion which would kill a man for a wrong done four years before to a woman who was not then his wife, but whom he made his mistress before he made her his wife. It was the only defense he could well make. He called it temporary insanity, but that sort of madness is what we commonly call anger, and we recall the old saw that "anger is a short madness." When one gets angry one gets mad, we say, but that is not what the law means by insanity. It is a misuse of language. The charge to the jury made the principles plain, but there were those on the jury who accepted the plea of insanity, in form, but who must have held that the man was so warped by his passion as to be insane, and that it served the victim right. It is not easy,

on the basis of written law and the charge of Judge Fitzgerald, to take any favorable view of the action of the five jurymen.

Every such trial disgusts the public with experts. Experts are paid big fees, so that their interest is at stake, and their testimony is from the beginning discounted. Somehow the practice ought to come to an end. The State ought to provide the experts, who should be impartial because they have no interest in the case, and who would give judgment in which we might place some confidence.

The Ecclesiastical Quid Pro Quo

THE one great charge brought against the French Government in its separation of Church and State, and its ceasing to pay the yearly salaries to the bishops and parish priests, is that inasmuch as the Church property was confiscated by the State at the time of the Revolution, the State was obliged to pay the support of the Church whose property it had taken. Much might be said on this matter, but we will now consider but a single point.

The Church property taken possession of at the Revolution, by a sort of eminent domain, or robbery, if you please, was of two sorts. A part of it consisted in churches and the attached buildings, residences of the bishops and parochial clergy, and part in the lands and estates, convents and other buildings belonging to the monastic orders. The latter were confiscated and largely sold, and the members of the orders were expelled from the country. Their loss was measurably complete. But it was a loss to themselves and not to the bishops and parish clergy, for none of their revenues went to the support of the Church in France, but it went wholly to the support of the orders themselves, under their superiors at Rome. It is just so everywhere under canon law. Nowhere is the property of the general orders under the control of the bishops and secular clergy. For example, the total property of the Sisters of Charity in this country, known as the white cornettes, with all their establishments from Boston to Tacoma, must reach about $70,000,000, but no bishop or archbishop has any authority or income from it. It is so with the immense property of the black-bonneted Sisters of Charity whom we see about New York, of whom there are a thousand employed as teachers of parochial schools in this diocese at from $200 to $400 a year, paid by the parishes to the order. Archbishop Farley has no control over its income from schools, hospitals, protectories, asylums, orphanages, etc. They receive from the city 37½ cents a day for over 2,000 foundlings and 62½ cents a day for perhaps 800 sent to the Protectory, but this money is all their own, and its profit supports no parish priest. The same is true of the male orders everywhere—Jesuits, Franciscans, Dominicans, Brothers, etc. Thus the Jesuits, who sold a good part of their fine estate at Fordham to the city have somewhere about 500 pupils at Fordham College who pay $300 a year, and about 600 at St. Francis who pay about $80 a year. They have also, contrary to canon law, two churches whose revenues the archbishop cannot touch. Their property in the whole country counts up many millions, but it is all their own, to support and develop their order, and pays no tax or revenue to bishop or clergy. This is the reason why so many bishops try to exclude the orders from their dioceses; but it is wiser to make terms with them.

Now this was the case in France before the Revolution. The French bishops and clergy had received no financial support from them, and lost no money by their suppression or the confiscation of their estates. They rather benefited by the removal of competing orders. It could not, then, be that it was in restitution for this loss that Napoleon consented to subsidize the clergy. He did it chiefly in the interests of public peace, that is, his own government, in order to insure the support of the Church which he had put under his thumb, both by his subvention and by his control over the appointment of bishops and priests.

The other class of ecclesiastical property that was sequestrated by the State at the Revolution was, as we have said, the places of worship and manses occupied by the bishops and parish priests. But these were not sold and alienated. Worship was still conducted in them, and their income from fees, masses, etc., was not removed. To be sure, the

churches belonged to the State, but that was little more than nominal, as the State allowed them still to remain in the possession of the priests as before, just as is the case now under the new laws, and even paid all the expense of repairs.

It follows that the property in the churches occupied by the parish priests was confiscated in form rather than fact, and that the property belonging to the orders which was confiscated and alienated never had supported the bishops and clergy; and the subvention granted them by Napoleon was not in payment for such losses which they had never suffered.

Just as at the Revolution the confiscation of the property acquired by the orders left the field to the parish clergy, so when the orders were again expelled a few years ago, the bishops and parish clergy gained in relative influence, and the orders were indignant that they had not received sufficient support; and it is now their influence with the Vatican which has been active against the secular clergy, and compelled them to give up their income from the State. It is hoped, on the one side, and feared on the other, that the result of this uncompromising policy will be to deprive the parish priests of their means of support, and open the way for their replacement by members of the orders. Now that the Pope has a free hand in the appointment of bishops, we may see Franciscans and even Jesuits appointed to bishoprics and archbishoprics.

The Scholar in Overalls

THE present age is sharply distinguished from all that have preceded it in the history of the human race by the amazing increase in wealth. In every civilized country the value of property per capita is far greater than ever before, notwithstanding the unprecedented increase in population during the last century and the rise of living expenses among all classes. Luxuries longed for or undreamed of by our parents are our common household conveniences. Our tenements are better than medieval palaces. Financial magnates employ corps of experts in the art of high living for the purpose of inventing new ways of spending more money. Last year we imported $125,000,000 worth of extravagances from Europe, diamonds, laces, feathers, champagne and the like. The bitter attack now being made from all sides against our unequal and inequitable method of distribution is due to the fact that there is more wealth to distribute than ever before. The bigger the spoil the more strenuous the struggle. Bricklayers now get more than professors used to, and still they are not satisfied, and there is no reason why they should be so long as they can get more.

This sudden increase in the wealth of the world can be traced to one cause. There is a new factor in civilization. This new wealth is the gift of modern applied science. All the other wealth producing factors have remained substantially unaltered. The natural resources of the earth are no greater; in fact, they are less, for our soil is less fertile and our ore lies deeper. It is not the discovery of America, adding two continents of new land, that has brought about this increased prosperity, for the most densely populated countries in Europe are increasing in wealth almost as rapidly as we are. The old world has always had waste land enough; already Americans are emigrating to Africa and Siberia. It is not because men of ability are any more common than they used to be. There has been no sudden eruption of genius on this planet. There has been no perceptible improvement in the human race since the time of Aristotle either in the intelligence of the average man, or in the number or eminence of the exceptional men.

Our enhanced wealth is not the product of manual labor. Men have always worked hard enough; never harder probably than when the fellahin built the pyramids of Egypt. There have always been capitalists, too, not so numerous nor so rich as at the present time, but enough to carry out large industrial enterprises whose ruins astonish us yet. Wars are not so frequent as they used to be, but they are more destructive, and Europe never spent so much in the most belligerent crises of past centuries as is now spent continuously in this time of peace on armies and navies.

No, what we have that our ancestors had not is more knowledge of the laws of nature and more willingness to apply them. There are some who complain that science is becoming commercialized. That may be, but a commercialized science makes greater progress than a philosophized science ever did; greater progress even in its most abstract branches. The shop is pushing the study. The mathematician works as he always has for the pure joy of seeing what the human mind can do with lines and numbers and quantities, but now the engineer waits impatiently beside his desk, like the office boy on the editor, to snatch his formulas from him before the ink is dry to construct a new dynamo with them. The chemist, working with the electric furnace out of pure curiosity and the desire to read a paper before the academy, makes some new carbides; within a few years the waterfalls of Europe and America are making them by the ton, and our automobiles are lighted by acetylene and polished with carborundum. A new element is discovered, good for nothing apparently except to fill a gap in Mendeleef's table, but it speedily appears in our gas burners and cuts down our bills.

It is this middleman between the scientist and the mechanic who is the new force which is accelerating the wheels of progress. It is the engineer, the technician; his profession is so recent that it has no proper name, but it has already made good its claim to an equal place beside the three historic learned professions. It requires no less scholarly preparation; in fact, it is cheaper to educate a lawyer or a minister, if not a doctor, than a technologist, and the last has greater assurance of immediate paying employment and better prospects for rising to a position of affluence. Some of our great industrial establishments have a standing offer of a job for all graduates of certain schools of technology. They tempt seniors to desert their class work and even fish for likely juniors, "rushing" them and getting them pledged in advance as college students work for their fraternities and athletic teams. The technical institute which Mr. Carnegie has established at a cost of $20,000,000 will do no more than supply the needs of the Pittsburg district. There is a chance for a dozen like it in the United States even at the present time. As for the future, it would be rash to prophesy, for applied science is yet in its infancy and we cannot tell what it will accomplish when it is full grown.

It is a new exponent that raises the efficiency of the individual to a higher power, but we do not know its limiting value. One man now makes twice as many tons of iron as he did ten years ago. In some manufactories where twenty or fifty men formerly were condemned to hard labor for life, now there are two or three, and they have little to do but watch dials and press buttons. We are told that the capitalist is destroying the middle class. It is still more significant of modern tendencies that the technician is eliminating the working class.

In most industries the number of workmen is diminishing in its ratio to the amount of the product. The future will have little use for the physical strength of man. Labor-saving and wealth-producing inventions will in time give the political economists something worth quarreling over.

A Question of Intellectual Ethics

A REPORT that the British Parliament may prohibit the republication of early and unrevised editions of the works of Spencer, Darwin, Huxley and Tyndall, on which copyright has expired, raises some nice questions of ethics and expediency. Most of them are details of the large and old question of the right of the dead to rule the living.

Among normally moral people there will be, we suppose, no difference of opinion upon one point. The publisher who puts forth unrevised editions representing them to be "complete" or "final" editions, is marketing goods under false pretenses, and should be dealt with as a misdemeanant. But to forbid the publication of any book which its author having once given to the world, has afterward corrected, or has attempted to suppress, is an act not to be so summarily judged and disposed of, so long as the

reprint is not misrepresented or palmed off for something which it is not.

It is true that there is no finer honesty than intellectual honesty, and that there is no finer or more courageous exhibition of it than is seen in the modification or retraction of opinions once held. The great leaders of evolutionist thought possessed this honesty in perfection, and all of them, as they amended their views, conscientiously revised their books. Naturally they felt the utmost unwillingness to have uncorrected early editions go on selling, and therefore to a considerable public misrepresenting their later thought. Mr. Spencer especially was extremely sensitive on this point, because one question upon which he changed his mind was that of the rightfulness and expediency of the private ownership of land. The revised edition of his first book, "Social Statics," is somewhat tame and conservative in comparison with the strong and daring pages of the edition of his early manhood.

While we should unquestionably hold such sensitiveness in decent respect, and while we should ever be careful not to quote earlier for later and revised opinions, it must be said that it is by no means certain that an author, however masterful and however conscientious, is altogether in the right when, having taken the public into his confidence, he tries to deprive it at a later time of means and opportunity to judge for itself which of differing statements is more nearly true, more nearly sound or more worthy of approval.

In many respects the knowledge and the wisdom of an old man are superior to the knowledge and the wisdom of his youth, but reservations may be made. It is not always true that the ripe thought of age is as good fruit as the product of middle life or even of early manhood. Authors, like engineers and warriors, sometimes lose their nerve, and while conscious of absolute integrity of purpose, they may unconsciously drift into a conservatism that must on all accounts be deplored.

Spencer did not greatly help his reputation by his revision of "The Social Statics," altho his absolute honesty in the premises is quite beyond doubt. It would be on all accounts regrettable if copies of the first edition should become practically unobtainable.

On the whole, it seems to us that the very highest degree of scrupulous honesty and moral courage demands of an author that he shall throw no obstacle in the way of the free circulation of his earlier and his corrected opinions side by side. The public alone is the competent final judge of their respective merits.

"The Independent's" New Covers

The cover designs that have been secured by means of the competitions we have had annually since 1905 have been, on the whole, so satisfactory that this scheme was again utilized for obtaining them for THE INDEPENDENT for the current year. In response to circulars issued and mailed to former contributors, various art schools and to individual artists, we received nearly two hundred cover designs. These came from all parts of the country and represented an exceedingly wide range as to merit. With all the cover designs offered as units, we arranged an exhibition, to which many of the competing artists came, as well as some of their friends. The designs were carefully numbered and artistically arranged by a hanging committee. Each visitor was provided with pencil and pad and asked to write down the favored designs. With these votes and the opinions of some of our artist friends as guides we selected and purchased covers offered by eight persons as follows, viz.: Miss Anna K. Wolter, Brooklyn, N. Y.; P. G. Laurson, Mitchell, S. Dak.; R. B. Sanford, Brooklyn, N. Y.; Carl F. Gronemann, Elgin, Ill.; L. Neill Woods (3), Baltimore, Md. (awarded the prize for the best design); Edward T. Scowcroft (2), Philadelphia, Pa.; Genevieve Wilgus, New York City, and T. R. Waite, New Haven, Conn. Miss Wolter's design appeared upon our issue of April 4th, and the others will appear from time to time during the next twelve months. The exhibition showed a very encouraging standard of excellence on the part of most of those who entered the competition. We hope our readers will like the designs selected quite as well as we do who are charged with the making of the magazine.

President Roosevelt on Peace

President Roosevelt is a soldier, and it is not every soldier who can say, "War is Hell." That President Roosevelt is the friend of peace, and will work hard for it, is proved by his labors for peace in the East, testified to by the world. But his message to the Peace Congress is less an earnest encouragement than a warning against excessive demands. He reminds the meeting that righteousness is better than peace, which is true; and he tells them that the more advanced nations must not so reduce their armaments as to leave them at the mercy of the more belligerent nations. This also may be true, if there are such nations to fear. Yet if six nations would agree to reduce armaments there would be no reason to fear the rest. Of course statesmen must keep eventualities in mind, but for the rest of us our best course is to press and press harder the cause of peace, assured that the defenders of big armaments will be strong enough.

Polygamous Marriages

One of the most debated questions in some parts of the world is, What shall be done with polygamous marriages when a pagan or Mohammedan becomes a Christian. We recall the case of an American Indian who was told that he must, on joining the church, put away one of his two wives. The older one said it would be much harder on the young wife to be put away, and so she left her husband and lived alone in a tepee. The Presbyterian missions in India, which are now united in a General Assembly, have lately tackled the subject, and reached a decision, after consulting twenty-nine presbyteries in which native members predominate, but in which both natives and missionaries agreed. The following is the conclusion of the General Assembly:

"It is not advisable to legislate, debarring from admission to the Christian Church an applicant for baptism solely on the ground of his having more than one wife to whom he was legally married before seeking admission to the Church, but that, in its opinion, it is right to leave the responsibility of deciding in individual cases as they arise, with Sessions, which should, however, if the Presbytery with which they are connected so desire, refer each case to the Presbytery."

Of course, the Assembly emphasizes the obligation of monogamy in the case of all others, and forbids, as did Paul, that polygamists shall hold any office in the Church, and it says:

"Such moral and spiritual pressure brought to bear upon the applicants, that where, without violating conscience or doing injustice to others concerned, satisfactory arrangements can be made for separation from all but one wife, this will be done."

We have no criticism to make of this action, for we are not wiser than Paul, or than those who are on the ground and have the responsibility. The bearing of that action on our conditions is not only in our dealing with our pagan Indians on the reservations, nor even with the Moslem Moros in the Philippines, but with our supposedly civilized Mormons, who took plural wives when it was legal, and who have refused in some scores of cases of now old men to discard their supernumerary consorts. It is a very bad case; they ought to have known better; but, somehow, we have ceased to meddle with them, and we allow them to die off as they are, simply for the same reason as controls in the Presbyterian missions in India—because we fear "doing injustice."

Unbalanced Pessimism

President Dabney, of the University of Cincinnati, and lately of the University of Tennessee, has lately made the same address to a Presbyterian brotherhood in Philadelphia and to the students of the University of Pennsylvania. He took for his text the remark credited to Speaker Cannon that "America is a hell of a success." He said we are not a success, unless, perhaps, materially, with our corrupt politics, our widespread machine rule, with the negro question unsolved, with our flood of immigration, and he added:

"With the gradual decrease in opportunities for the young men in the East, it seems to me that instead of America being a hell of a success, this material success is making a hell of us."

That is not the way President Jordan talks about the chance for his young graduates. President Dabney went on to talk to the university students of the

Smoot case. A very intelligent and careful listener thus repeats him substantially:

"What a travesty we have recently witnessed in the United States Senate of a trial for theoretical polygamy by men, the most of whom are guilty of consecutive polygamy. Is not the sin of consecutive polygamy as great and as dangerous to the family as that of contemporaneous polygamy?"

Doubtless he thought he was saying "many of whom" and not "most of whom" were divorced. But in either case it was strange language to speak to young men, and it is a yellow slander on the United States Senate—what we might have expected from one who has a less admirable record than has President Dabney.

Racial Characteristics

Patrick Ford, editor of *The Irish World*, thus writes us:

The *Catholic Universe* states that Mr. Maurice Weidenthal, in THE INDEPENDENT, compliments the Irish on having systematically driven the so-called comedians from aspersing the Irish character on the stage. And adds: He calls on the Jews to go and do likewise.

The Irish World holds that Mr. Weidenthal is right in his contention, and it is to be hoped that his advice will be followed by the Jews.

I don't object to racial characteristics being presented on the stage if the characterization is only fairly presented. But unfortunately the Irish peasant, as he exists in real life, is never truly portrayed on the theatrical stage, whether in accent, in manner, or in facial makeup.

On this subject the Irish spirit on both sides of the ocean is now thoroughly roused. All self-respecting men of the Irish race are now "on their muscle" (pardon the slang) and they will win out. Will you kindly say a word in our contention?

Of course, it is the business of comedy to exaggerate and caricature, and doubtless the Irish have suffered from this. But we would have Mr. Ford also give his attention elsewhere, for a story that has been running in a most important Catholic monthly has given pictures of the Irish peasants such as would defy caricature.

When the Catholic Archbishops meet in conference not much news is expected to be given out, but one bit of action taken at their meeting in Washington last week is of real interest. It is that plans were made for a more accurate enumeration of Catholics in connection with the Federal census of religious organizations. In the Census of 1890, the last religious census held, the number of Catholic communicants was found to be 6,231,417, which made a population of about 7,250,000—less by several millions than had been claimed. Since then the Catholic population has grown not a little, and the claims proportionally, so that some 15,000,000 population is claimed. But these are large, round figures. Thus the Catholic Almanac calls the Catholic population in the Archdiocese of Baltimore 250,000—evidently a mere conjecture. Other religious bodies, such as the Baptists, the Disciples and the Colored Methodists, have no reliable statistics, and the new religious census cannot but be very valuable.

If the men who meet this week in a National Arbitration Congress could have their way the United States would never be engaged in another war. So distinguished and representative a body of citizens has seldom been gathered in any public meeting. The sessions began on Sunday evening in a most inspiring meeting, which absolutely crowded Carnegie Hall to the roof, and at which Protestants, Catholics and Jews were represented by Bishop Potter, Archbishop Farley and Rabbi Hirsch. That represents the unanimous voice of religion. At other meetings this week the voices of jurisprudence, education, literature and journalism speak thru their most distinguished representatives. Meetings like this express and create such influential judgments as will move the world. War must give place to the arbitration of law. We call the attention of our readers to a quite full bibliography of Peace, which we print on another page.

We have just heard of one more society which wants only a hundred members, at five dollars a year, to carry it on, and a most worthy society it is, with Prof. Albert S. Cook, of Yale University, as president. Its name is the Concordance Society, and it appeals to scholars of English who need concordances in their study of the history of the language. The only English concordances now available are those of the fol-

lowing books or authors: The Bible, The Book of Common Prayer, Burns, Cowper, Fitzgerald's "Omar," Keble, Milton, Pope, Shakespeare, Shelley, the *Spectator*, Tennyson (incomplete). There is none of Wordsworth, Browning, Coleridge or Keats, and, what is more unfortunate, none of Chaucer or Spenser. This is a kind of work level to common diligence, and requires nothing more. It ought to attract men or women of leisure, and our college faculties ought very easily to fill the list of members.

We read in a Richmond, Va., paper a long editorial giving the story told by a colored minister in Springfield of his failures to find lucrative employment for negroes in that city due to racial prejudice. We do not doubt that every word is true. There is a great deal of it North as well as South, but it does not follow, as that journal says, that "the negro likes the South better than he likes the North." That is a question easily settled by the census. The tide is all in one direction, and so strong is it that Northern cities have these newcomers by the tens of thousands, and they will not go back. They find even the Northern discrimination in business a relief from lynchings and Jim Crow legislation. But it is bad enough even here, where it is difficult for negroes to get a home in an attractive location. But they are making good progress and feel encouraged.

We published in our issue of March 28th an article with the heading "The Work of the Carnegie Institution, by R. S. Woodward, President of the Carnegie Institution." We received it thru our literary agent, in whose carefulness we had full confidence, and who assured us that the article, which we are informed was compiled from the Year Book of the Institution, had Dr. Woodward's authorization to be used with his name. Dr. Woodward informs us that he had given no permission to attach his name to it, and we greatly regret that the error was made.

Comparisons are odious, and sometimes odorous. In a communication to *The Churchman* the Rev. F. W. Harriman, of Windsor, Conn., defending the scholarship of the Episcopal Church against an apparent slight in *The Churchman* itself, says:

> "Have we not at least a ministry more highly educated in the average than that of any other Protestant denomination around us, except (perhaps) the Presbyterians in the older parts of the country."

We certainly shall not enter into the question raised by the leading Episcopal journal in the country whether its Church is lacking in productive scholarship.

In Missouri it has been agreed between the Northern and the Southern Methodists that if in any place churches of the two bodies wish to unite they may do so provided, first, that the joint committees of the two conferences recommend it; and, second, a majority of the membership of the two churches desire it; and then the two supervising bishops agree. This seems to be sufficiently guarded; but would it be an awful sin—schism, rebellion, or something worse—if they should wish to unite and should do so even if the joint committees and the bishops refused their approval?

We may say a word of appreciation of the late Bishop Fitzgerald, who held the Catholic see of Little Rock for forty years. He was a good man, and that he was as independent as he was conscientious is shown by the fact that at the last vote on infallibility at the Vatican Council he was one of the only two bishops who voted No. The others changed when they saw the inevitable, or were silent, or had hastened home. A brother of his not long after renounced the priesthood and entered secular life.

A bill is before the British House of Commons "to amend the Church Discipline Act, 1840, and the Public Worship Regulation Act, 1874." Its purpose is to abolish the veto of the bishops and relieve clergy of imprisonment who defy the law in matters of ritual or doctrine. That is the kind of legislation that must be considered in a country which does not separate Church from State.

FIRE ENGINE NO. 6—(Specially photographed for *The Independent.*)
Captain Robert J. Teare on the tailboard.

Latest Type of Fire Engine

WHEN a metropolitan fire engine, in answer to a box call, dashes furiously down a crowded street, with driver strapped firmly to his seat, clanging bell and smoke rolling picturesquely heavenward, the whole symbolizing the protecting power of a great fire department, there is no one within range of eye or ear that remains unmoved. Fire that is such a good servant but so hard a master attracts every one with its spectacular features. The combination of man with horse and machine to combat this fire monster work together to make the modern fire engine about as perfect a creation as it is possible to find. When we look back upon the beginnings of fire protection, with its crude passing of impotent fire pails by the old time bucket brigade, or even the primitive hand engine that closely followed the fire pails, and compare the methods of fire fighting that now obtain, we can but marvel at the evolution that has taken place, not only in apparatus, but in everything else connected with the warfare against fire. The daily work of a metropolitan fireman contemplates heroism almost as a matter of routine. The magnificent engine pictured upon this page is considered by Edward F. Croker, the chief of the department, to be one of the very latest and best engines now used by the New York Fire Department in the Borough of Manhattan. It is housed at No. 113 Liberty street, and has its complement of trained horses that respond so quickly when an alarm comes in that the machine, fully equipped, can get away from its engine house to answer a fire call in ten seconds. Technical skill of the highest order has been lavished upon this engine by its builders. It weighs 8,800 pounds and cost the city not quite $6,000. Upon occasion it can throw four simultaneous streams of water upon a stubborn fire.

Financial

Trade Relations with Germany

At the dinner given last week to Charlemagne Tower, the American Ambassador to Germany, by Herman Ridder, of the New York *Staats Zeitung*, our trade relations with Germany were discussed in addresses which were notable by reason of their clearness, the authority of the speakers, and the admirable spirit of international friendliness and good will which characterized all that was said. This was especially true of the remarks made by Ambassador Tower, whose influence has been exerted at Berlin to promote the success of the negotiations of Dr. North and our State Department for averting commercial hostilities until it shall be possible to make the permanent commercial treaty that is needed. While the executive branch of our Government, however, has been engaged in such negotiations, Germany has met us more than half way and has assisted us in every possible manner.

Our exporters are now enjoying the minimum rates of the German tariff by favor rather than by right. If the Senate could have been induced to consider favorably a treaty of reciprocity, we should now have those rates by an enduring agreement. Germany desired no tariff war. She consented (in February, 1906) to give us the low rates for sixteen months, without compensation in kind, assuming that before June 30, 1907, we would make and ratify a reciprocal treaty like those by which seven other countries have obtained those rates by giving something in return for them. We have not improved the opportunity afforded by the delay, and when June 30th arrives there will be no treaty.

Germany, therefore, in a conciliatory spirit, has consented to a further extension of what is called the provisorium, probably until June 30th, 1908. And it is understood that all we give for this extension is as follows: A reduction of one-quarter of the duty on German champagne, this being a reciprocal change for which authority is found in the Dingley act; a continuation of the open hearings upon disputed questions of value at the custom houses, when requested by importers; a careful consideration of certificates of the German Chamber of Commerce as to wholesale prices of German goods; and a substitution of duly accredited agents for secret special agents for investigations in Germany concerning goods exported from that country. All this may be done under existing laws. On the other hand, Germany removes her restrictions upon the importation of American bacon and dressed meats. Probably an agreement embodying these terms will go into effect. But it will be temporary, and Germany will still expect us to negotiate and ratify a comprehensive treaty of reciprocity.

The new Congress cannot afford to ignore this question. It should be impressed by the abundant proofs of Germany's patience, friendliness and conciliatory attitude, and should meet Germany's advance in a proper spirit. Neither at Washington nor in any other part of the United States should there be any further exhibition of that carping tone of criticism, that tendency to impute hostile or sinister motives to the German Emperor and Government, which Mr. Stone, of the Associated Press, deplored in his remarks at the dinner to Mr. Tower. There has been much evidence of the friendly attitude of Germany and the Kaiser. Good will on both sides should be expressed by reasonable commercial reciprocity.

* * *

....Fifty locomotives and 100,000 tons of railway material are soon to be shipped from Baltimore to Dalny, Manchuria. This will be the first shipment of the kind from the United States to that province.

....The industrial capital stock represented in the listed and unlisted departments of the New York Stock Exchange now exceeds $4,000,000,000, the increase having been 563 per cent. in twenty years and 210 per cent. in ten years. The railroad securities listed amount to about $5,330,000,000.

....On January 31st there were in existence 6,315 national banks, having an authorized capital of $867,776,275. Under the act of March 14th, 1900, permitting the formation of banks with a minimum capital of $25,000, 2,124 associations have been chartered, with an average capitalization of $26,075.

Survey of the World

The Peace Congress

The long heralded National Arbitration and Peace Congress convened Sunday night last week at Carnegie Hall and ended on Wednesday evening, the 17th, with two magnificent and simultaneous banquets at the Astor and the Waldorf-Astoria. During its session there were held nine formal sessions devoted to peace from the standpoint respectively of religion, the city, State and nation, the world, women, commerce, industry and agriculture, young people, colleges and universities, organized labor and legislation. Besides this there were less formal conferences of religious and ethical bodies, students, peace workers and delegates, to say nothing of numerous receptions by social clubs and individuals. Some 1,500 delegates were present from nearly all the States in the Union and from the principal foreign nations. Carnegie Hall was filled to overflowing at every session, not only on the platform and the floor of the house but in the two grand tiers of boxes and the two galleries above them. The sessions at Cooper Union and at the Hotel Astor were also filled to the doors. The Congress as a whole was by far the largest ever held in the cause of peace and the list of members, speakers and delegates comprise probably as distinguished a list of names as have ever joined together at one time to promote a great idea in an unofficial Congress.

The Speeches

Of course, in an immense congress of this kind there were some speeches better than others, some that appealed to the heart, some to the head, and some, as several of the daily papers erroneously reported, to the spleen. Unquestionably the most inspiring session of the Congress was that of Tuesday afternoon, devoted entirely to the young people. The public schools of the entire city sent enough delegates to fill the whole house with the exception of the two tiers of boxes, which were occupied by the private schools. Each delegate reported back to his school or class what he had seen, thus acquainting every school child in Greater New York with the Peace movement. Next to the enthusiastic school children, the speech at the Astor banquet of Edward Everett Hale, "the Grand Old Man of America," as Andrew Carnegie introduced him, appealed most to the sentiments of the delegates. The keynote of his address was "justice first and then peace." He said the first Peace Society of the world was formed when the United States of America was born. It will be remembered that Dr. Hale went up and down the land calling for a High Court of the Nations long before the idea of calling the first Hague Conference entered the head of the Czar of Russia. Special mention should also be made of the impression created by Baron D'Estournelles de Constant upon every audience he addressed. The Gallic wit and graceful eloquence of this most accomplished French Senator was especially in evidence when at the Hotel Astor he referred to the school children and Dr. Hale—the best of the youth and age of America—working together for the ideals of peace and good will, and then ended by tying about Mr. Carnegie's neck—much to Mr. Carnegie's surprise, confusion and pleasure—the Cross of the

Legion of Honor, conferred by the French Government upon the president of the Congress. Mr. Stead, the editor of the *Review of Reviews,* and Mr. Bryan were unquestionably the most popular orators with the audiences, and the latter made three genuinely great speeches. He was easily the most prominent figure at the Conference. But the speech of most importance was doubtless that by Secretary Root, delivered on the opening afternoon. As it was prepared with much care and doubtless foreshadows the attitude of the Administration in regard to the questions to come before the second Hague Conference, which convenes this June, it has received much attention. Secretary Root favors the limitation of armaments. He says:

"We have not been unmindful of the fact that the question is one which primarily and in its present stage concerns Europe rather than America; that the conditions which have led to the great armaments of the present day are mainly European conditions, and that it would ill become us to be forward or dogmatic in a matter which is so much more vital to the nations of Europe than to ourselves. It sometimes happens, however, that a State having little or no special material interest in a proposal can, for that very reason, advance the proposal with the more advantage and the less prejudice. The American Government accordingly, at an early stage of the discussion regarding the program, reserved the right to present this subject for the consideration of the Conference; several European Powers have also given notice of their intention to present the subject." . . .

In regard to the collection of contract debts by force, the Secretary indorses the Drago Doctrine. He says:

"It has long been the established policy of the United States not to use its army and navy for the collection of such debts. We have not considered the use of force for such a purpose consistent with that respect for the independent sovereignty of other members of the family of nations which is the most important principle of international law and the chief protection of weak nations against oppression. It seems to us that the practice is injurious in its general effect upon relations of nations and upon welfare of weak and disordered States, whose development ought to be encouraged in the interests of civilization, and that it offers frequent temptation to bullying and oppression and to unnecessary and unjustifiable warfare. It is possible that the non-payment of public debts may be accomplished by such circumstances of fraud and wrongdoing or violation of treaties as to justify the use of force as a last resort; but we hope to see an international consideration of the subject which shall discriminate between such causes and the simple non-performance of a contract with a private person, and to see a resolution in favor of reliance exclusively upon peaceful means, in cases of the latter class."

In regard to extending the principle of arbitration, the Secretary says:

"What we need for the further development of arbitration is the substitution of judicial action for diplomatic action, the substitution of judicial sense of responsibility for diplomatic sense of responsibility. We need for arbitration, not distinguished public men concerned in all the international questions of the day, but judges who will be interested only in the question appearing upon the record before them. Plainly this end is to be attained by the establishment of a court of permanent judges who will have no other occupation and no other interest but the exercise of the judicial faculty under the sanction of that high sense of responsibility which has made the courts of justice in the civilized nations of the world the exponents of all that is best and noblest in modern civilization."

Then ending his long speech the Secretary thus referred to the hopes of the world from the Second Hague Conference:

"It is an essential characteristic of such a conference that it shall deal not with matters upon which the nations differ, but with matters upon which the nations agree. Immaterial differences may be smoothed away; misunderstandings may be explained; consideration and discussion along lines that do not run counter to any immediate and specific interest may work out methods of applying general principles in such a way as to prevent future differences; progress may be made toward agreement upon matters which are not yet ripe for complete adjustment; but the moment an attempt is made to give such a Conference any coercive effect, the moment any number of nations endeavor to use the Conference for the purpose of compelling any other nation to do what it deems inconsistent with its interests, that moment the Conference fails. Such a Conference is an agency of peace; not the peace of conquest, but the peace of agreement; not enforced agreement, but willing and cheerful agreement. So far as the nations can go together in such an agreement, the Conference can go, and no further."

Next to Secretary Root's speech, perhaps the most notable was that of Congressman Richard Bartholdt, who argued for the endorsement of the resolutions approved by the fourteenth Interparliamentary Conference at London in July, 1906, which were as follows:

"1. Periodic assembling of an International Conference.

"2. The granting of jurisdiction to The

1. Professor Hugo Munsterburg. 2. Baron D'Estournelles de Constant. 3. Andrew Carnegie. 4. Samuel Gompers. 5. Professor Richard.

THE SPEAKERS AT THE NATIONAL PEACE AND ARBITRATION CONGRESS, CARNEGIE HALL, MONDAY EVENING, APRIL 15.

Photograph copyrighted, 1907, by Underwood & Underwood.

Hague Court in a clearly defined area thru treaties of arbitration.

"3. Investigation or mediation, before the commencement of hostilities, in all questions reserved for final settlement on the field of battle.

"4. National appropriations annually in aid of international arbitration; and,

"5. Appointment of national commissions for the study of the question of armament with a view to an international agreement to limit or reduce them."

Other notable speeches were by Miss Jane Addams, of Chicago, who talked along the lines of her recent book, "Newer Ideals of Peace"; Edwin D. Mead, of Boston, who made a spirited plea to the colleges to lead in the peace movement; William Archer, the English critic, who suggested a new international peace flag, somewhat analogous to the Stars and Stripes:

"The star, as it is the most wonderful of all visible things, is the most beautiful of all symbols; and I have floating in my mind a vision of a Star of Stars—a star-cluster grouped so as to form a single star—which I think might perhaps serve the purpose."

President Roosevelt could not attend the conference, but he sent a letter in which he approved the purposes of the congress, but advised them not to anticipate too speedy success. He suggested that possibly the size of battleships might be advantageously limited in the future.

The Resolutions

The gist of the whole Congress is summed up in the following resolutions, which we print in full:

"Resolved, By the National Arbitration and Peace Congress held in New York City, April 14 to 17, 1907, composed of delegates from thirty-five States, that the Government of the United States be requested, thru its representatives to the Second Hague Conference, to urge upon that body the formation of a more permanent and more comprehensive International Union for the regular purpose of insuring the efficient co-operation of the nations in the development and application of international law and the maintenance of the peace of the world;

"Resolved, That, to this end, it is the judgment of this Congress that the governments should provide that The Hague Conference shall hereafter be a permanent institution, with representatives from all the nations, meeting periodically for the regular and systematic consideration of the international problems constantly arising in the intercourse of the nations, and that we invite our Government to instruct its delegates to the coming Conference to secure, if possible, action in this direction;

"Resolved, That as a logical sequence of the First Hague Conference, The Hague Court should be open to all the nations of the world;

"Resolved, That a general treaty of arbitration for ratification by all the nations should be drafted by the coming Conference, providing for the reference to The Hague Court of international disputes which may hereafter arise, which cannot be adjusted by diplomacy;

"Resolved, That the Congress records its endorsement of the resolution adopted by the Interparliamentary Union at its Conference last July, that in case of disputes arising between nations which it may not be possible to embrace within the terms of an arbitration convention, the disputing parties before resorting to force shall always invoke the services of an International Commission of Inquiry, or the mediation of one or more friendly Powers.

"Resolved, That our Government be requested to urge upon the coming Hague Conference the adoption of the proposition, long advocated by our country, to extend to private property at sea the same immunity from capture in war as now shelters private property on land;

"Resolved, That the time has arrived for decided action toward the limitation of the burdens of armaments, which have enormously increased since 1899, and the Government of the United States is respectfully requested and urged to instruct its delegates to the coming Hague Conference to support with the full weight of our national influence the proposition of the British Government, as announced by the Prime Minister, to have, if possible, the subject of armaments considered by the Conference;

"Resolved, That the Congress highly appreciates the eminent services of President Roosevelt in bringing The Hague Court into successful operation, in exercising his good offices for restoring peace between Russia and Japan, in preventing, in co-operation with Mexico, a threatened war in Central America, and in initiating, at the request of the Interparliamentary Union, the assembling of a second International Peace Conference at The Hague. It congratulates him upon the reception of the Nobel Prize as a just recognition of his efficient services for peace;

"Resolved, That the distinguished services of the Hon. Elihu Root, Secretary of State, to the cause of international peace and good will, during his recent visits to the South American capitals and to Canada, be accorded the grateful recognition of this Congress;

"Resolved, That we thank the Prime Minister of Great Britain, Sir Henry Campbell-Bannerman, for the noble stand which he has taken in favor of a settled policy of peace among the nations, and of a limitation and reduction of the military and naval burdens now weighing upon the world;

"Resolved, That a copy of these resolutions be sent by a committee of this Congress, to be appointed by the President of the Congress, to President Roosevelt, to Secretary Root, and to each of the United States delegates to the forthcoming Hague Conference."

Political Topics There is much public interest in recent evidence that the President has undertaken to assist Governor Hughes, of New York, in obtaining reform legislation at Albany and in procuring the removal of the present Superintendent of Insurance. In the Legislature, the Governor has been opposed by a minority of his own party, with whom some Democrats appear to be in alliance. Henry W. Taft, of New York, a brother of the Secretary of War, had an interview with the President on the 15th, and immediately thereafter gave to the press a statement that Governor Hughes had the support of the President, and that (in his own opinion) some way must be found for obtaining "the sympathetic support of the organization" in New York for the Governor. On the 18th, the resignation of A. W. Sanders, Internal Revenue Collector for the western district of New York since 1898, was demanded. Whereupon ex-Congressman James W. Wadsworth, upon whose recommendation Mr. Sanders was appointed, attacked the President in a published statement, declaring that he was "a fakir and a humbug," and asserting that the removal of Sanders and the refusal to reappoint certain postmasters were violations of the President's own precepts and promises. [These charges are considered on another page.] Announcement was made at the White House, by authority, that the action taken with respect to Collector Sanders and the postmasters was designed to strengthen the hands of Governor Hughes, and that in the matter of appointments thereafter to be made the same purpose would be kept in view. At this writing no charges against Collector Sanders or the postmasters have been made public. Some express the opinion that, while the President desires to assist Governor Hughes, he has also in mind the State's delegation to the Republican National Convention in 1908. Mr. Wadsworth, whose defeat by Mr. Porter at the last election was due to his action concerning the Meat Inspection bill, desires, it is said, to be a member of that delegation. It is pointed out that, being hostile to the President, he would probably, as a delegate, oppose the nomination of a representative of the President and his policies.——Speaking in Brooklyn on the 16th, Mr. Bryan said that nothing could prevent the coming of the initiative and the referendum. "No one," he continued, "will deny the value of the initiative and referendum unless you deny the capacity of the people for self-government. You may differ with me on other points, but if you do not believe in the right of the people to govern themselves you will drive yourselves out of the Democratic party; and if the Democratic party does not believe in the rule of the people, you will have no trouble in driving me out of it." He predicted that the Democrats would win a victory in 1908 and would retain power thereafter for "generations."

Interesting Land Cases There are curious circumstances connected with the indictment said to have been found against United States Senator W. E. Borah, of Idaho, for violation of the laws governing the acquisition of public lands. Senator Borah was employed some months ago as leading special counsel for the prosecution of Moyer, Haywood and Pettibone (of the Western Federation of Miners), for the murder of ex-Governor Steunenberg, and he has made arguments in the preliminary proceedings. It was asserted on the 11th in dispatches to Pacific Coast papers that he had been indicted by a Federal grand jury, together with James E. Barber, of Wisconsin, president of the Barber Lumber Company, and L. G. Chapman, manager of the same company, who was then in jail for contempt because he had refused to produce the company's records. The Senator had been the company's counsel. Not until two or three days later were dispatches about the indictment published in the East, and at this writing no really authoritative statement concerning it has appeared. It is said that all the indictments were duly reported to the court, but that no information about them was officially made known. On the 16th, District Attorney Ruick, who had laid the evidence before the grand jury, was summoned to Washington. It was said that the friends of the Senator had asked for delay on account of his connection with the approaching trial of the mur-

der case. Among the reports published was one that indictments had been obtained by one faction in the Republican party at the expense of the other faction. It was also said that the late ex-Governor Steunenberg had been interested in the land operations concerning which testimony was given. On the 20th the Government brought suit to recover 40,000 acres, valued at $1,000,000, which had been patented to the Barber Lumber Company.——Governor H. J. Hagerman, of New Mexico, resigned last week, at the President's request, owing, it is reported, to his official approval of the transfer of a large tract of land to a company in which Delegate Andrews, formerly of Pennsylvania, is interested. It is said that he merely completed a transaction which had nearly been finished by his predecessor. In his place the President has appointed George Curry, now Governor of Samar, in the Philippines.——At Omaha, last week, Thomas M. Huntington, a banker, A B. Todd, and Frederick Hoyt were convicted of conspiracy to defraud the Government of great tracks of land, amounting, it is said, to about 500,000 acres. These defendants were indicted with Bartlett Richards and others, who were convicted some time ago.

Secretary Taft's Visit to Porto Rico

Secretary Taft arrived at San Juan on the 14th and remained on the island four days. From the capital he crossed to Ponce by automobile, stopping in several towns. At all the public receptions and banquets native speakers gave earnest expression to the desire of the people for American citizenship. The Secretary in reply referred to the recommendation made by the President in favor of granting such citizenship, spoke of difficulties encountered in Congress, and pointed to the advantages which Porto Rico already had gained by reason of annexation to the United States. The island, he reminded his audiences, had escaped the complications and disadvantages which have been experienced in the Philippines and in Cuba. The islanders should remember, he said, that they had gained free access to the markets of the United States, and for this reason were enjoying prosperity. They already had the substance of citizenship. At Ponce he said:

"I ask what it is that a Porto Rican does not enjoy that an American enjoys. You have every guarantee and security which a citizen of the United States has under the Constitution. You have the writ of habeas corpus and the trial by jury, and when you are in a foreign country the same flag protects you that protects a citizen of the United States. Therefore, while President Roosevelt urges citizenship, he urges it on the ground of gratifying the sentiment of the people of this island. But when you come to examine the facts of what you ask, the question is whether it is not nominal rather than substantial."

Regis Henri Post was inaugurated as Governor on the 18th.——France has imposed her maximum duties upon coffee imported from the United States or Porto Rico, owing partly, it is said, to the failure of our Senate even to consider the pending treaty of reciprocity. France is now almost the only market for the coffee of Porto Rico.

Earthquake in Mexico

Earthquake shocks, first felt at a late hour on the night of the 14th, and repeated thereafter, have caused much loss of life and property in the southern part of Mexico, the district most seriously affected including the State of Guerrero and parts of adjoining States. In the three cities of Chilpancingo, Chilapa and Tixtla, which are about 125 miles south of the city of Mexico, hundreds of buildings were wrecked and about 100 persons were killed. A considerable part of Ajutla was destroyed, and nine persons were killed there. The first shock at Chilpancingo occurred at 11.50 p. m., and other shocks followed during the ensuing four hours. Among the structures wrecked there were the municipal buildings, the school buildings and the hospitals. It is said that in Chilapa few buildings remain standing. From many small settlements no news has been received. At Acapulco, the water front was submerged by great waves. Persons who were at sea in the southern part of the Gulf of Mexico say that the water was disturbed in an extraordinary manner, that explosions were heard, and that there was a strong odor of sulfur. A similar odor accompanied the earthquake in Mexican cities. Shocks were felt in the Mexi-

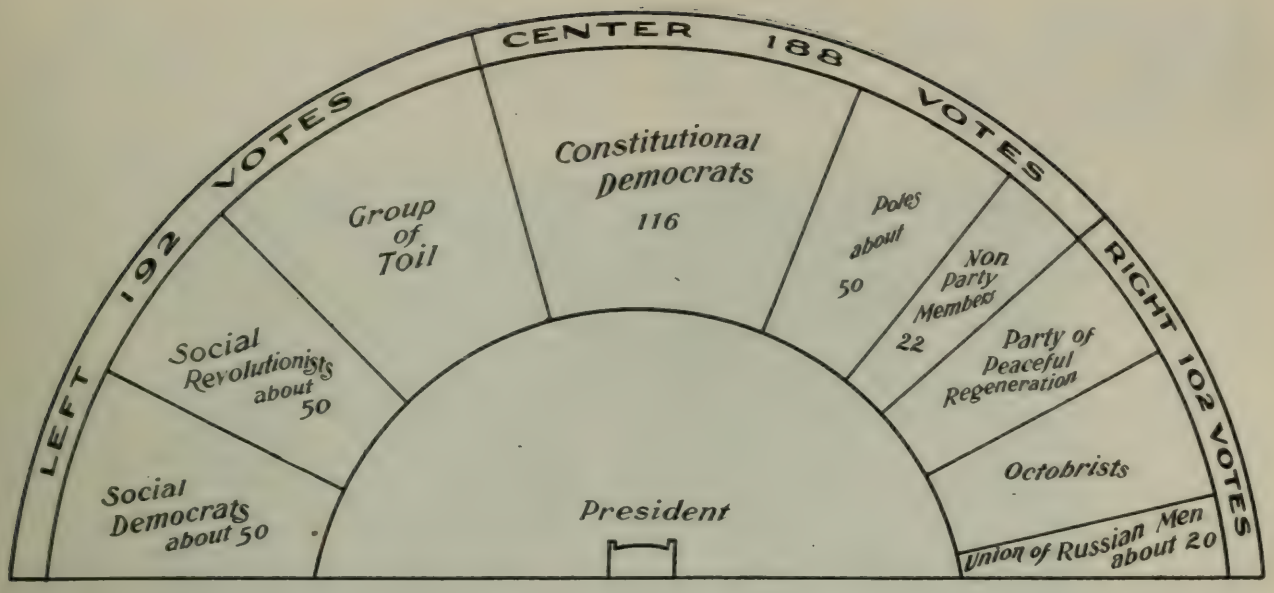
can capital. The walls of the old and famous cathedral there were cracked from the base to the top. Not far from the district which suffered most are the volcanos of Colima and Jorullo. The first of these is displaying unwonted activity. In various parts of this district there are large rents in the earth, and railways have been disabled by the sinking of tracks. The earthquake was indicated at 1.14 a. m. on the 15th by seismographs at Albany and Washington. On the 17th there were sharp shocks in Spain and Turkey, and the Puyehue volcano, in Chile, was in violent eruption. Two days later there were shocks in the Philippine Islands, and tremors were felt at Charleston, S. C.

The British Colonial Conference

The Conference of the Premiers of Great Britain's self-governing colonies, held in London during the past week, may prove to be a decisive point in the history of the British Empire, notwithstanding that it has ostensibly an unofficial and unauthoritative character. The colonies are thru it practically making a demand upon the mother country for admittance into partnership, and it is freely acknowledged by the English as well as colonial papers that the persistent refusal of this demand may lead to a separation. Sir Edward Grey, the Foreign Secretary, in a dinner address to the Premiers admitted that Great Britain had made a mistake in her colonial policy in a former century, and hoped that it would not be repeated now. Mr. Deakin, the Australian Premier, said on the same occasion that the Colonial Office was further from the colonies than the colonies from the Colonial Office. The colonies should be treated as independent nations. Next year Australia would inaugurate a system whereby she could defend herself in the event of war without assistance from the mother country. A plan for a permanent reorganization of an Imperial Council was presented before the Conference in the following resolutions prepared by Australia:

"That it is desirable to establish an Imperial Council, to consist of representatives of Great Britain and the self-governing colonies, chosen *ex officio* from their existing administrations. That the objects of such Council shall be to discuss at regular conferences matters of common Imperial interest, and to establish a system by which members of the Council shall be kept informed during the periods between the conferences in regard to matters which have been or may be subjects for discussion. That there shall be a permanent secretarial staff charged with the duty of obtaining information for the use of the Council, of attending to the execution of its resolutions, and of conducting correspondence on matters relating to its affairs. That the expenses of such a staff shall be borne by the countries represented on the Council in proportion to their populations.

"That this Conference recognizes that the principle of preferential trade between the United Kingdom and His Majesty's dominions beyond the seas would stimulate and facilitate mutual commercial intercourse, and would, by promoting the development of the resources and industries of the several parts, strengthen the Empire.



Premier Campbell-Bannerman, in opening the proceedings, told the Premiers that they had no power to arrive at any binding decisions, for the Imperial Government could not go behind the declared opinions of the country and Parliament, but subject to this limitation there were many matters of great moment in which there was room for arrangement of mutual advantage. The order of business, as laid down by the Colonial Secretary, Lord Elgin, who presides over the Conference, was as follows: The Constitution of Future Conferences, Preferential Trade, Defense, Naturalization, Emigration; next in order will come: Judicial Appeals, Reservation of Bills, Extension of British Interests in the Pacific; finally, and if time allows, discussion might proceed with regard to Uniformity of Patents, Merchandise Marks Legislation, Reciprocity in Professions, Metric System. The Premiers present include Dr. Jameson of Cape Colony; General Louis Botha, Premier of the Transvaal; Alfred Deakin, the Australian Premier; Sir Joseph G. Ward, Premier of New Zealand; Frederick R. Moor, Premier of Natal; Sir Wilfrid Laurier, Premier of Canada, and Premier Sir Robert Bond, of Newfoundland. The colonial Premiers wished the proceedings to be made public, but the Government insisted on private sessions, giving out an official *résumé* of the proceedings at the end of each day's session. The general plan for permanent organization as presented by Australia was adopted, but Sir Wilfrid Laurier, Premier of Canada, and General Botha, Premier of the Transvaal, objected to

the title of "Imperial Council" as an infraction of the rights of the responsible governments. Accordingly "Imperial Conference" was decided upon. A new department of the Colonial Office will be created in accordance with the desire of the Conference, for the purpose of obtaining information on imperial matters and serving as a medium for exchange of views between the sessions of the Conference. The Earl of Elgin announced that the Australian proposition for an independent body would not be acceptable to His Majesty's Government. The draft of a resolution creating a General Staff for the Empire was tabled. It was resolved that the colonies be authorized to refer to the Committee of Imperial Defense for advice on local questions in which expert assistance is desirable. The reception given to General Botha, both at the official entertainments and whenever he appeared on the street, was exceptionally enthusiastic. At the luncheon given in the Guildhall he sat next to Field-Marshal Lord Roberts, his former adversary, and they talked over their experiences on the veldt. Secretary for War Haldane, in a speech given at a banquet preceding the Conference, made the following reference to General Botha, which was received with loud cheers:

"As the Secretary of State responsible for the War Office, I welcome a new General among us, and a very great General, too, and I believe my General Staff and I are going to have the pleasure on Saturday of conferring with him on the mutual defense of the Empire."

British Finances

On April 18th Herbert Henry Asquith, Chancellor of the Exchequer, presented to the House of Commons the budget statement of the Government. Instead of the expected deficit there is a large surplus, and the Government has been able to reduce the permanent national debt by $68,570,000. The total addition to the public debt in consequence of the war in South Africa was $795,000,000. This war debt has now been reduced by $100,865,000. The treasury receipts were over $10,000,000 in excess of the estimates, unexpected death duties amounting to $6,000,000 of this sum, while the rest was made upon increased receipts of the coal duty and the mint. The removal of a tax of a penny a pound has increased the consumption of tea by 4,500,000 pounds. The revenue from tobacco had not realized the expectations, but that from beer and spirits, which had been declining for the last seven years, had again risen and produced an increased revenue of $2,470,000. The falling off in the postal receipts is in consequence of the slackness of the operations on the Stock Exchange, and the fact that the telephone was superseding letters. During the financial year of 1907-8 the Chancellor estimates the expenditure at $703,785,000, a reduction of $8,320,000 compared with 1906-7. On the existing basis of taxation a revenue for the forthcoming year is estimated at $720,950,000, and showing an estimated surplus of $17,165,000. The income tax would not be removed, but a distinction would be made between earned and unearned incomes, which at present are taxed uniformly a shilling on the pound. The Chancellor proposes that earned incomes under $10,000 a year shall hereafter pay only ninepence on the pound instead of a shilling. The loss from this reduction of the income tax will be made up by a graduated increase in the death duties as follows: Five per cent. as at present on $750,000 and under; above $750,000, 7 per cent.; above $1,250,000, 8 per cent.; above $2,500,000, 9 per cent.; above $3,750,000 and up to $5,000,000, 10 per cent. On estates of $10,000,000, 14 per cent. would be levied on the second $5,000,000. On estates of $15,000,000 or over, 10 per cent. would be levied on the first $5,000,000 and 15 per cent. on every other $5,000,000. He proposes to keep $1,665,000 as an emergency fund and set aside $7,500,000 for the establishment of an old age pension system. The further reduction of the national debt was, he said, the paramount duty of the Government, but beyond that there was nothing that appeals so loudly and imperatively as the possibilities of social reform.——This practical postponement of old age pensions until next year is regarded by the Labor Party as a betrayal of confidence on the part of the Government. James Keir Hardie calls it "a brutal budget" contrived in the interests of the middle classes.

The Political Situation in Russia

BY ALEXIS ALADIN

[The following informing article is by the accredited representative in America of the Group of Toil in the second Duma, a character sketch of whom appeared in THE INDEPENDENT of February 28th. Mr. Aladin will probably remain in the United States till summer, and in the meantime will speak in our large cities with the purpose of arousing public sentiment here for the Russian Revolution. An organization called "The Friends of Russian Freedom" has been formed here to assist Mr. Aladin and Mr. Tchaykovsky in their American propaganda, and it is hoped that as a result American bankers will refuse to lend money to the Russian Government, and that our Congress at its next session will pass resolutions protesting against the autocracy's treatment of the people.—EDITOR.]

THE first Russian Duma, which existed for less than two months last year, accomplished its great task of creating in the country a point of concentration for all national energies. The revolutionary parties, the working classes of the cities, did not believe in the first Duma, boycotted it; they accepted with hope the second Duma; the nation became united in its efforts to get a bill of rights and a system of responsible, representative government. The second Duma leads the people.

What is its composition? Imagine a half-circle; a chair in front of the diameter of the circle; then to the left of the chairman you see a group of men, *192* all told; they represent two great sections of the Russian people—the workers of the city and the peasantry of the country; they are the Extreme Left, or "the Left" for short. They are subdivided into three smaller sections. The Social Democrats, representatives of the working classes, sit in a group of about 50 men at the extremest left; next to them are the Social Revolutionists, practically the same number of men; they come from somewhat less industrial districts; their neighbors are the Group of Toil, champions of the peasants and farmers. The Group of Toil and the Social Revolutionists go hand in hand with each other and represent the center of gravitation of the whole Left. This year the Left is stronger than it was in the first Duma, where they only numbered 116 men.

The center of the House is occupied by the Constitutional Democrats, 116 men; the party of the rising middle classes of the cities, representatives of the liberal professions, the commerce, trade and of the most enlightened part of the nobility. Among them you find professors, lawyers, engineers—men of experience in administration and governmental work. In the first Duma they were 152; now they returned in re-

duced numbers, but still they are the very flower of the House, intellectually and socially; therefore, in spite of their numerical inferiority, they are given by the Left the privilege of choosing from among them the President and Secretary of the House.

These two parties ruled the first Duma and they rule the second Duma.

They expressed their aspirations in their answer to the Crown speech in the first Duma. They are formulated briefly:

A complete political amnesty.

A bill of rights (freedom of conscience, press, association, meeting, inviolability of person.)

A ministry acceptable and responsible to the Duma.

ALEXIS ALADIN.

More land for starving peasants.

Effective control of the finances of the country.

Gradual amelioration of the situation of the working classes.

Abolition of all exceptional laws, under which life and liberty are not safe.

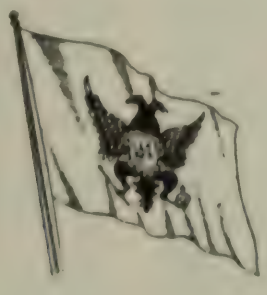
The immediate neighbors of the Constitutional Democrats and their allies on all political questions are the Poles, about fifty men.

Wedged between the Poles and the

Extreme Right are the non-party men, an insignificant group of twenty-two; by no means can they even be called supporters of the Government; they vote always against it.

The Extreme Right boast of having 102 men; let it be so. Are they united? No. They represent three sections—the Party of Peaceful Regeneration, the Octobrists and the Union of Russian Men. There is no difference between the first two; both represent the smaller nobility of the country, high financial circles and the money lending element of the villages; both stand for some sort of representative government; only personal jealousies of the leaders divide them. Being for some sort of representative government, they could not give an unqualified support to the Government and they do not give it.

The Government can rely under any circumstances only upon twenty men of the Union of Russian Men. Whom do they represent? The scum of the cities, organized by the police, and the peasants of the darkest corners of the Empire. Anyhow it is not they who could influence the House.



And what is the policy of the Duma? To formulate in the rigid form of laws the aspirations of the country, without giving the Government any chance to dissolve the Duma on a side issue. So far this policy has been successful; trying on the members, but successful. Neither on the burning question of amnesty, nor on the question of relief of the starving peasantry did the members of the Duma commit inconsiderate actions; even the all-important question of the annual budget was received by them in a perfectly constitutional and conciliatory manner. The Duma has done all that was humanly possible to do in the way of concessions to spare the country from a conflict with the Government.

And yet the Government is not pleased with the Duma. The Premier uses as the supreme constitutional argument the armed guards of the palace in which the Duma sits, so as to exclude from the building the outside experts invited by the various commissions of the House. His colleague, the Minister of Justice, came to the House to ask the suspension of three members for their supposed crimes "committed previously to their election." The armed troops are pouring steadily into the Capital. The official mouthpiece of the Court Party, Mr. Martens, explains in a long letter to the London *Times* that the Duma is unfit and its dissolution is only a question of time.

The Government seems to be under the impression that the dissolution of the second Duma is after all an easy matter; the people will not fight for it, and, even if they do, they will be defeated.

Possibly they will be; still the victory lies in the hand of God, and to treat lightly the question of a possible national conflict seems to me an act not of a statesman, but of an irresponsible, short-sighted official. It is appalling to think that the future of a country of one hundred and fifty millions of inhabitants is in such hands; still it is so, and the nearest future may bring quite unexpected developments. With all my heart I pray may my country be spared from the horrors of an open conflict!

NEW YORK CITY.

Reading Aloud

BY J. H. MORSE, A. M.

Author of "Summer Haven Songs," Etc.

LORD ALFRED TENNYSON, as we are told by his son, was "very willing to read aloud." Of this "toward" disposition indeed we have abundant testimony in the report of travelers, who, visiting at Farringford, were taken after dinner to the poet's den in the roof for a quiet talk. There, with due lay-out of pipes and, perhaps, at hand, for ready reference, "one of the few bottles of my Waterloo—1815," or possibly "a magnum of wonderful sherry, thirty years old, meant to be drunk by Cleopatra or Catharine of Russia," some opportune book was sure to suggest to the visitor its need of elucidation. If the guest happened to be of the true Heliconian breed, the deep, sonorous voice of the poet would soon be sounding.

A voice it was, "low and calm in everyday life, capable of delicate and manifold inflection, but with organ tones of great power and range." Professor Palgrave admits that "casual hearers" sometimes found both "voice and delivery monotonous"; and Bayard Taylor may have been one of the casual hearers, for visiting Farringford in 1867, he heard the poet over the pipes read "Boadicea," "chanting the lumbering lines with great unction." That same evening, sitting in the parlor, with the family about the "magnum," the "willing voice" intoned the long billowy lines of "Guinevere"; and it was still "a strange, monotonous chant, with unexpected falling inflections."

One suspects a pulpit solemnity in the organ tones—the graces of many generations of preachers. Or was it in him the poetic reminiscence of the marching chant of ceremonial Greece and Rome? We all catch the distemper from a thousand sermons, if we have it not by inheritance. Wordsworth had it —bad.

Reading free from this taint is rare. But then good readers anyway are rare —especially good *home* readers—after-dinner readers—readers for one choice companion—the one, perhaps, who must stand us for life; or the two or three who can be caught young, only able to escape in the recalcitrant period of youth.

The Greek chant is hardly a welcome guest in the willing half-hour, between eight o'clock and nine. The soul reaches out then for something more soothing and soft—less public in its appeal; it resents the form elocutionary—the deliberate rhetorical; and the dramatic, impressive manner is to be escaped at all hazards. As was said above, Wordsworth had it bad. Visiting him at Rydal Mount in 1833, Emerson, himself a reader of great personal magnetism, especially alluring on the platform (I have heard him when you could hear a pin drop behind the fortieth pew)—the Emerson who had just stept out of the pulpit and had a large Puritan inheritance—walked up the shaded lane to Rydal Mount and talked with the laureate under that green arbor which is now somewhat dilapidated. Wordsworth, tho sixty-three that year and white-haired, was by no means an old man; he had seventeen years yet before him; but, like Tennyson, he was

"very willing to read aloud." Nor did he precisely wait to be asked. He had just finished three of the sonnets on "Fingal's Cave." Sonnets not the best of his five hundred odd—but the very latest, and therefore the nearest to his heart. He plunged in at once.

"Perhaps you will like to hear these lines?"

To which, says Emerson, "I gladly assented, and he recollected himself for a few moments, and then stood forth and repeated, one after another, the three sonnets with great animation. . . . The recitation was so unlooked for and surprising—he, the old Wordsworth, standing apart, and reciting to me in a garden-walk, like a schoolboy declaiming —that I at first was near to laugh."

Such declamatory style is clearly not for the willing half-hour before bed-time. Nor is that drowsy period just exactly the best for the melodious epic, with its rhythmic beat. Soporiferous is the word for it, unless its interpreter be a Tennyson, with the organ tones, reading his own "Maud" or "Guinevere." Generally the poet himself is far from being his own best interpreter, tho in his agony at some misinterpretation by another he may lend himself to a violent attack on his own verse. Every man in his heart does murder when shown the first photographic representation of himself; he is sure he is not *that fellow! That* fellow is merely the production of plain sunlight; while *he* is accustomed to behold himself by the aid of "the light that never was on sea or land." Who, without being "near to laugh," can imagine the dear old poet of Rydal Mount —dead-sure believer in his own interpretation of the one and only Nature-light—declaiming his own exquisite lines:

"I met Louisa in the shade?"

or that sweetest, saddest love poem in the language:

"She dwelt among the untrodden ways
Beside the springs of Dove?"

or with platform gesticulations, twisting out the hidden felicities of the "Cuckoo?"

If the bard is ever justified in taking the platform with his "songs unsung," it is only when the song is a true platform poem.

Good reading is rare; and yet one is inclined to think it need not be so very rare. Half an hour an evening, in the home circle, with the one or two or three for an uncritical audience, will go far in a year to develop the first and best requisite—a manageable voice, "low and calm, capable of delicate and manifold inflection." Such home practice, continued, would invigorate the organ of speech, enrich the tones of the happy instrument. If the performer by some blessed chance can evade the ordinary voice trainer, lose the reader in the thing read—be, in short, so far mastered by another's ten talents as to be able to forget the single talent which he is trying to keep at interest—then in time all good things may come to him. Ease and grace are best acquired by a subconscious performance of whatever we do. For instance, a man may, even after his fortieth year, acquire the "Dutch roll" in skating, if he can forget his age, and, like a boy, be willing to chance a fall. He may attain to "oneness" with a bicycle by a frank surrender, at any cost, to the pretty caprices of that skittish thing. And so, by a gentle detachment of the self-referring gear of the mind, he may slip into the graces of good reading and become capable of the "beach-combers" of Kipling, the billowy breakers of Tennyson—which have often "to be taken at one breath"—and the foamy, twisted, long roll of Scott—that hissing, consonantal, rough sea of the old "Three-deckers."

The lungs expand to meet all contingencies; the throat makes taut the vocal chords to sing any ocean music; the eye is lifted over a larger expanse and gives warning of dangers ahead.

Precisely what the evening book shall be requires consideration. It is to suffer a severe test; and, to be acceptable for its purpose, the book's manners must be choice. Manners are style, which may be jerky or long winded—may be easy and natural of movement, so that a beginner in the art of vocal expression may read on without dread of being pitched head foremost over the precipitous end of a sentence, or the sentences may exhaust the breath of the reader and leave the hearer with a

grieved sense that he has been too long buttonholed by the Ancient Mariner, as at that moment when

"The Wedding Guest he beat his breast,
Yet he cannot choose but hear."

Then, for the *matter* of the book—the audience is to be considered. Of course the children whose heads are only twelve inches above the father's knees have already been sent to bed wondering just how "Old Mother Hubbard, she went to the cupboard to get the poor dog a bone." The next tier of flossy heads also have retired happy after a selection from those delightful imaginings: "The Ting-a-ling Tales," "Mowgli," or "Alice in Wonderland." That was in the "children's hour," when we say: "Good night! Sweet dreams!" and drop the kiss at the parting of the flossy ways. But at the evening hour we are all children. Do we not all want sweet dreams? And shall we then, between nine o'clock and ten, be called upon to invade the slums? Or with some enterprising novelist take the hand of the night reporter and copy the "blotter"? Shall we, as a preparation for sweet slumbers, be asked to assist in summing up the infelicities of the *demi-monde?*

Some sifting of the books must be had for the sake of the "one only," and some also for ourselves. As a rule, verse, and that in thrifty measure, may be relegated to the last ten minutes, just before the hand is on the lamp. Perhaps it is a reviving realization that the imagination has been permitted, in the years of an active life, to become atrophied, that leads us all, as early middle age approaches—say sixty or thereabouts—to take to fiction. We jostle that stagnant cell in the brain that for half a life hasn't been called upon to shimmer with a sunny breeze from the upper blue of a pure imagination. "Don't put my Scott, my Dickens, my Thackeray upside down on the top shelf. I shall want it tonight," we say to the girl who dusts the books. Autobiography, biography, history—those are admissible, if they come with the glow of genius on their foreheads. At this hour we want them with all the illuminated towers. History shall touch here and there a mountain hight. Autobiography may lead us sparingly thru the leather district, if it will permit also a short session on the balconies of kings. Say what we will, we all love the page with the illuminated borders, whether the colors are of the palette or of the goose quill. I know a lady who all summer listened to the ten volumes of the "Life of Lincoln" and wanted more.

But, after all, we lean most to the novel for the easy-chaired, slippered evening hour; but it must be thoroly good, ample and deep. It must have insight, humor and a well-full of human experience, and must leave us hopeful and restful. "I like the great *still* books," said Tennyson; and as much of them as possible. "I wish there were a great novel in a hundred volumes, that I might go on and on!"

Is there not just now a reaction in favor of those "still books"? I have recently read one which seems to hark back to the old "Three-decker" of Walter Scott's day—a wide, human book, of rare artistic beauty, yet wholly modern in its substance. It gives a *whole* life—a group of them. You hear the baby's rattle, the wedding chimes, the toll of the funeral bell. Joy is chastened; sorrow has its lining of evening glories; this life is shown as leaning on the eternities. A half-way inn is this book, "Joseph Vance," to the old port, where once waited at anchor the altogether delightful "Three-deckers" of Walter Scott, ready to bear us to the Islands of the Blest, while

"We asked no social questions—we pumped no hidden shame,
We never talked obstetrics when the little stranger came.
We left the Lord in heaven, we left the fiends in hell.
We weren't exactly Jussufs, but—Zuleika didn't tell."

NEW YORK CITY.

MUSIC ART AND DRAMA

A Musical Retrospect

In the cities of Germany there are concerts and operas ten months in the year, and English journalists have lately boasted that London would hereafter have music all the year 'round. Not so New York; here we have half a year's feast, followed by six months of fasting of total abstinence from music except in our homes and the parks. There are the roof garden entertainments, to be sure, but they are too light and frothy to count for much. Regular summer concerts, with programs of light but good music, have often been attempted ever since the days of Theodore Thomas and Anton Seidl; but even those eminent and popular conductors could not put them on a paying basis, while others have failed conspicuously.

Grand Opera

Perhaps it is just as well to let our ears have a rest for six months; we need it if we are to have hereafter as busy seasons as during the past six months, unless we are willing to become musical dyspeptics. The critics, for the most part, seem to have become such already. Unlike their European colleags, who go to the opera only when there is something new, or an important change of cast, the unfortunate musical scribes of this city are expected—in some cases actually obliged—to be present at every performances for fear that they might miss some important "news" item, such as a black cat walking across the stage, or a singer becoming suddenly hoarse, necessitating a hurry call for the protean Andreas Dippel. The result is that these critic-reporters, after hearing an opera ten or twelve times in a few weeks, feel toward it and its interpreters as a man who is eating quail on a wager feels after his twelfth bird, and the public wonders what can be the matter that the greatest singers in the world should have come to seem so loathsome to the journalists.

The latest victim of critical dyspepsia has been Emma Calvé. Before her arrival from Paris "Carmen" had been sung fifteen times at the Manhattan since December. Her reappearance made it necessary for the critics to sit thru the whole opera again, and *voila!*—the sixteenth quail! She had grown old and fat, she had lost the beauty of her voice, sang flat (or sharp; expert opinions on that point were divided), and no longer even attempted to act, but simply "guyed the public"!

Ordinary mortals, with normal organs of taste and digestion, saw and heard none of these dreadful things. To them Calvé was the same fascinating woman, the same great artist she has always been—an artist endowed with a voice of luscious beauty, singing nearly always in tune, and ranking as an actress, especially in the matter of facial expression, above all other opera singers of our time, perhaps of all time. She appeared also as Santuzza, in "Cavalleria Rusticana," and as Anita in Massenet's one-act military opera, "La Navarraise," in each case deeply impressing her hearers. The public, fortunately, was not misled by the gripings of the quail-eaters, but crowded the Manhattan at each of her appearances, thus rewarding Mr. Hammerstein for his enterprise in bringing over France's best operatic artist, if only for eight or nine performances.

"Carmen," with 19 performances, heads the list of the operas heard at the Manhattan. "Aïda," notable for its ad

mirable ensemble, comes next, with 12 hearings; "Rigoletto" had 11; "I Pagliacci," 10; "Cavalleria" and "Faust," 8 each; "Lucia," 7; "Il Trovatore" and "Les Huguenots," 5; "Don Giovanni," "Marta," "Fra Diavolo," "Traviata" and "La Bohême," 4; "Sonnambula," "Mignon," "Elixir of Love," 3; "Il Barbiere," "I Puritani," "Masked Ball," "Dinorah," "Navarraise," 2.

MADAME CALVE.
The most famous of "Carmens" is appearing at the Manhattan Opera House, after a three years' absence from the lyric stage of New York.

Twenty-two operas in twenty weeks is certainly a remarkable achievement, of which Mr. Hammerstein may well be proud. Mr. Conried, to be sure, produced twenty-nine operas in eighteen weeks, but he was not, like his rival, obliged to create everything anew. He had his own troubles, however—the necessity of creating a new chorus and of replacing the scenery of nearly a dozen operas destroyed in the San Francisco fire. Mr. Conried's long illness, too, was a serious matter. Yet the season progressed to the satisfaction of the public.

Perhaps it would have been well had the public been allowed to decide the question whether Strauss's "Salome" is wanted on this side of the water. Many believe that it would not have survived the first three or four performances, for the reason that, with all its sensationalism, it is rather dull from a vocal and melodic point of view, giving the singers few opportunities. Mr. Conried himself believes otherwise, and he has announced his intention of giving several "Salome" performances next autumn previous to the regular season, but not at the Metropolitan. His arrangement with Strauss, who is a shrewd and merciless business man, compels him either to do that or to pay a heavy forfeit. He has the exclusive American rights to this opera, and he says that several other managers are ready to mount it if he should relinquish his claims.

For the sake of comparison, Mr. Conried's list may here be reproduced: "Hänsel and Gretel," one is glad to know, again leads the list with 8 performances. "La Bohême" had 7: "Aïda," "Tosca," 6; "Madama Butterfly," "Tannhäuser," "La Damnation de Faust," "Lohengrin," "Roméo et Juliette," 5; "Fedora," "Lucia," "Siegfried," "Faust," "I Pagliacci," "Tristan and Isolde," 4; "La Traviata," "Marta," "Lakmé," "Manon Lescaut," 3; "L'Africaine," "Parsifal," "Rigoletto," "Walküre," 2; "Salome," "Carmen," "Don Pasquale," "Cavalleria Rusticana," "Rheingold," "Götterdämmerung," 1. Wagner leads, with 24 performances. Puccini coming next, with 21, followed by Verdi with 11.

For next season Mr. Conried has projected a complete Wagner cycle, beginning with "Rienzi" and "The Flying Dutchman," which have not been heard here in a number of years. Evidently Mr. Caruso is not "the whole show" at the Metropolitan, after all. In Boston

he was entirely overshadowed, when the Conried company reached that town, by Geraldine Farrar, who was fêted there quite *à la Berlin*. She was born in Melrose, and the Bostonians were proud to call this eminent prima donna their own. Thousands tried in vain to get tickets when she sang, and the receipts for the week were $70,000. In other cities, also, the performances were well attended (Chicago paid $83,000 for a week's opera), wherefore the season has ended with a handsome profit, notwithstanding the San Francisco losses.

The advance subscription sale for next season already exceeds $400,000. At least $1,500,000 was spent in New York City for grand opera in the six months from November to April, and it has been satisfactorily demonstrated that the metropolis can support two grand opera houses at top-notch prices. Indeed, on not a few evenings, when Melba sang at the Manhattan and Caruso at the Metropolitan, applicants for tickets were turned away at both houses.

But tho thoroly acclimated here, opera still remains an exotic so far as the creative side is concerned. We have great American singers—Nordica, Eames, Farrar, Homer, Edyth Walker, Bessie Abott, Fremstad—but no American operas are ever sung. Professor Paine's "Azara" still awaits a hearing, and Silas G. Pratt has two operas ready for the managers. Victor Herbert has been commissioned by Oscar Hammerstein (who offers $1,000 for a good libretto) to write a grand opera for him, and there are good reasons to believe he will succeed. Professor Converse, of Harvard, is in search of a libretto, and Arthur Nevins has written an Indian opera; so that, altogether, there is some hope for the future.

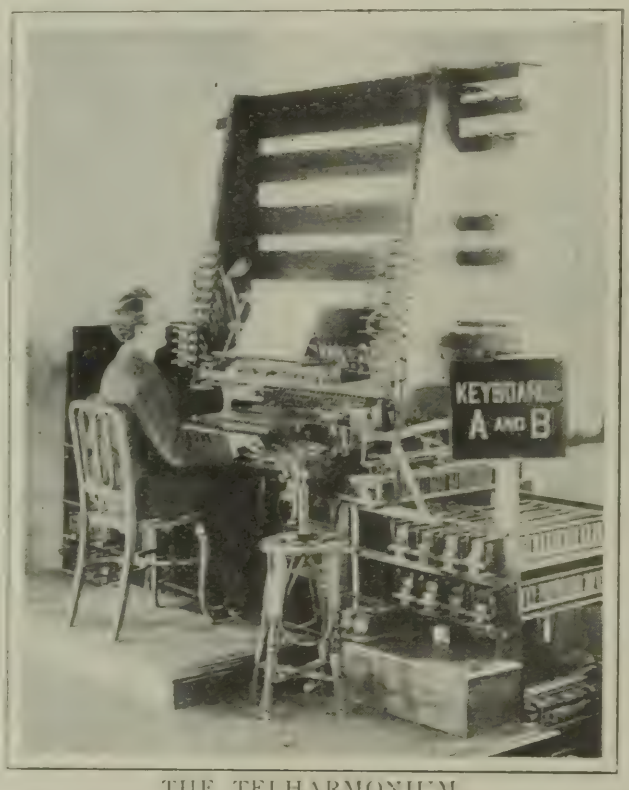
Concerts

The best thing about New York's opera-mania is that it does not seem in the least to injure the organizations that give concerts. There are, to be sure, fewer concerts than there used to be by teachers and minor professionals; the excessive severity of New York criticisms has helped to sweep them away; but that is a small loss. The great orchestral and choral societies have not suffered. The Philharmonic Society, under Mr. Safonoff, has enjoyed the most prosperous season in its whole career, declaring a dividend of $350 for each of its hundred members. The Boston Orchestra's concerts at Carnegie Hall, under Dr. Muck, also had "record" audiences. The concerts of the New York Symphony Orchestra, under Mr. Walter Damrosch, showed no falling off in attendance due to the opera, nor did those of Mr. Frank Damrosch's Musical Art and Oratorio Societies.

Additional interest was given to the last two concerts of the Oratorio Society by the fact that the composer of the works sung, Sir Edward Elgar, personally conducted them. "The Apostles" had been heard here before, but "The Kingdom," which is a sequel to it, was new. While not remarkable for melodic invention, it is an excellent sample of Elgar's extraordinary skill in building up choral climaxes and in orchestral coloring.

Elgar was the fifth of the prominent European composers to visit us this year, having been preceded by Leoncavallo, Coleridge-Taylor, Puccini and Scriabine.

Prominent among the soloists who have won laurels are Rosenthal, Gabrilowitch, Samaroff, Cottlow, Bloomfield-Zeisler, Lhévinne, Goodson, Maud Powell, Macmillen, Petschnikoff, Elsa Ruegger. In chamber music the Kneisel and Olive Mead Quartets have led, as usual.



The sensational success of the Toronto Mendelssohn Choir must not be overlooked in our retrospect, nor the first public concert of the aristocratic Mendelssohn Glee Club of New York, which added $5,000 to the fund in aid of America's greatest composer, the stricken Edward MacDowell; nor the Grieg concert for the building of a monument in Greater New York to Norway's chief composer.

The musical season practically closes this month; but in May New York, Philadelphia, Baltimore, Washington and Buffalo will have an opportunity to hear the famous Mannergesangverein of Vienna, reputed to be the best male choral society in the world.

Music by Wire

A new and very interesting instrument, the Telharmonium, is now attracting a good deal of public attention, and promises to place at the command of those desiring it better music than that commonly discoursed in hotels, restaurants and like places by union musicians, at less cost per "harmel"—a new unit compounded of harmony and melody, after the manner in which the technical literature of electricity has been enriched with a new nomenclature.

By most of those who have visited the experimental demonstration of Telharmony, and listened to the excellent music produced, it is assumed that what is sent out over the system of wires radiating from the central station is music identical with, or equivalent to, that thus heard. This is wholly a mistake. What is sent out is simply an electric current of desired quality. It becomes music only when it finds at the other end of the line a vocal organ capable of converting the vibrations of the current into sound. The complex machinery of the central station is not music producing in any sense. Its sole function is to generate, blend and transmit to suitable conductors an alternating current of varying frequencies of vibration. Each of the large number of dynamos in the basement is wound in such manner as to give a current of given frequency of vibrations. Thus constructed it can give nothing else—a fact of interest, in that a dynamo cannot get "out of tune" unless its winding is changed. When the kind of current a dynamo is generating is needed, the pressure of a key in the keyboard of the organ-like construction upstairs closes the circuit and takes as much or little of it as may be required for the purposes of the operator. It reaches the circulatory system thru a device called a tone mixer—a misnomer, since there are no tones at that stage to mix. The so-called tone mixer is really a transformer, by which in some way not easily explained in intelligible language, currents are modified and brought into proper relation to other currents.

THE TELHARMONIUM.
This instrument can transmit music 1,000 miles and play to 100 audiences at once.

As the keys are touched currents of specific frequencies of vibration are passed by metallic contact to the conductors. As the keys are released the currents they control are shut off. Obviously the flexible fingers of an organist, running over a keyboard of four or five banks, will touch a great many keys in a minute — more or less, of course, according to the kind of music desired. This means that as many variations in frequency of vibration are expressed in the current passing to the conductors, as the player touches keys in a given time. So far as the central station is concerned that is all that is accomplished. That any music is heard there is not because it is necessary that it should be, unless as a guide to the player and to enable him to keep in sympathy with what he is doing, but because there is provided an outfit of the same kind of vocal organs which are installed at the end of a consumer's service line. What is here described as a vocal organ is a simple disc of thin iron capable of taking up and making audible the vibrations of the

current which reaches it, and which keeps it in a condition of intense, if invisible, agitation. We have exactly the same thing in the receiver and transmitter of the telephone and in the throat of the phonograph and its variants. The layman who examines such a disc and becomes aware by observation of its capacity to reproduce any kind and quality of tone, as apt to wonder that nature wasted so much ingenuity in devising the human throat equipment, when all it is capable of doing can be duplicated by a little iron plate about the size of a silver dollar and worth perhaps two cents. This is not very practical reasoning, of course, but it is perhaps natural in the sore throat season.

That the inventor of this system, Dr. Thaddeus Cahill, has made a conspicuous technical success must be admitted. To do this has not, so far as we are aware, involved any new discoveries in the domain of physics. It has long been known that anything capable of setting up vibrations of given frequency was also capable of producing a note of given pitch in a suitable medium. The beauty and interest of the Telharmonium consists in the perfection of the mechanism with which this familiar phenomenon is utilized in the generation of a current transmissible by wire which, by means so simple as the vibrating disc of the telephone and phonograph, is converted into musical sounds. This permits music to be "laid on" like water or gas, as one of the modern improvements, and its control is as easy as turning a switch in an electric light switchboard. To understand its essence, which is all a layman can reasonably expect, he has only to imagine himself as holding to his ear the receiver of a telephone, when the transmitter opens into an apartment in which an orchestra is playing. He would hear every note of every instrument. Eliminate all confusing noises due to induction, all buzzing and snapping, the interruption of central to know "Are you through?" the exasperating disconnection and the intrusive cross communication, and you have Telharmony. Substitute for the orchestra a very intricate and beautiful device for producing vibrations capable of transmission into sound waves, and you have the Telharmonium. This is probably not at all as the expert would describe it, but it has the advantage of being intelligible and correct.

Art Notes

April seems to be the month when the largest number of artists have a season's work ready to show us. The National Academy of Design, the Ten American Painters, the Miniature Society, the Society of Keramic Arts and many of the students' organizations have given us their annual exhibitions. Artists have been discussing in the newspapers their difficulties in finding room in New York galleries for the proper presentation of their efforts, while Philadelphia has been rejoicing in the hope of a two million dollar municipal art gallery promised them by P. A. B. Widener, together with his own collection of excellent pictures, and Pittsburg has its new Carnegie Institute, with increased areas for art exhibitions, and is at present enjoying the only international exhibition enjoyed in America during the year.

The Academy opened a day or two after the last art notice in these columns went to press and will be closed before this is printed. It was not an exhibition which had any remarkable features. As with the majority of our large exhibitions, a first visit gave one the pleasantest of impressions an American exhibition generally gives, that of a good high average of technical skill, especially in the handling of tone. Repeated visits resulted in disappointment with the general content of the work. With all sympathy for the Academy's expressed desire for larger galleries one cannot wish for a larger exhibition of canvases that make as shortlived an impression as did most of those shown this year. After a lapse of two weeks one observer at least can remember vividly only Luis Mora's portrait of his wife for its genuine beauty of selection and handling, John Lambert's "Albert Chevalier as 'Awkins" for its easy characterization of a personality of course quite easy to characterize, Sergeant Kendal's "Interlude," another study of mother and child in his serial

presentation of the same motive, and Ballin's "The Three Ages," because it won a prize rather than because it is a success. There were many landscapes faithful enough to phases of nature but not here in the great jumble to be seen at their best. Only Bryson Burroughs's delightful "Bogy-land" had any real power of amusing a picture-hunter.

A delightful afternoon with landscape painters included visits to the Century Club to see the work of Birge Harrison, to Macbeth's for the Keiths from San Francisco, to Montross's for the Lathrops, and then down to Oehme's to see the work of Henry Golden Dearth. Four widely differing points of view were in these places comfortably to be enjoyed. Harrison, at first glance, seems unnecessarily literal and preoccupied with vivid effects of color not always beautiful. But closer study of these ef-

"MAY NIGHT."
From the painting by Willard L. Metcalf, at the Montross Galleries.

fects themselves shows a remarkable understanding of their real pictorial value. Such a picture as that of the "St. Lawrence from Quebec," with an amazing series of gradations in reds and other hot colors, all kept cool by balanced relations, is a remarkable feat of color memory and reasoning. His sense of line, too, is fine. In a "Roadside Inn by Moonlight," "Plymouth Harbor in Winter," and many others line and color are equally pleasing, and one left the exhibition with conviction of the man's virile hold upon his medium.

At the Keith exhibition the whole outlook upon art and nature was different. Here one felt that certain themes of landscape composition were made the vehicle of strong color emotions felt but not seen objectively at all. Keith's compositions vary little. Large tree forms generally frame a light "center of interest" which may be a cloud or a sunset seen thru a vista, but which always follows more or less of a formula as to placing, so that it is not always easy to differentiate between the pictures except thru their color. But here Keith gives a rich treat with his mellow harmonies so that any one of the canvases is a delight to a color lover. Mr. Keith lost many works in the San Francisco earthquake and the twenty-four here shown are all recent.

Different again were the works of W. L. Lathrop, at Montross's. More akin to Harrison's in a certain realism, they were yet so much more subtle and sensitive that their beauties seemed only to unfold after an appreciable time spent with them. Quite high in key, yet containing wonderfully true relative values, Lathrop's method is especially capable of rendering tender things like "Early Spring" and "Melting Snow" and "Evening Light." These pictures will be on exhibition until April 27th.

The Dearths, at Ochme's, showed two veins. One in which he paints rather poetically and in a big way such renderings of actual places as Montreuil or Boulogne under different light effects. Then at times he becomes a bit riotous after the manner of Turner or of Monticelli, one feels, and paints a "Souvenir of Versailles" with glowing spottiness, or "A Fantasy in Yellows." But here, as with the other men visited, there was much beauty, and the conviction was strengthened that in landscape we are doing our best work.

The Ten American Painters include men about equally interested in figures and landscape, except Dewing, a figure painter of superlative talent, in whose three small canvases were to be seen all the delicate loveliness we are accustomed to get from his work. Willard L. Metcalf had three landscapes happily showing his steady growth. "The May Night" had been already bought by the Corcoran Gallery before its exhibition in New York. Tarbell showed an unfinished "New England Interior," another of his masterly genre subjects, as finished as a "Little Master" of the Netherlands, but with the additional beauty of color seen by the modern temperament. Weir's things were, as usual, all good, but there was none among them better

A CORNER IN THE MINIATURE EXHIBITION AT KNOEDLER'S.

than his past best. Chase was at his best; so was Benson. Childe Hassam was not, perhaps, nor Robert Reid. DeCamp and Simmons have not developed any new phases.

The eighth annual exhibition of the American Society of Miniature Painters was open till the 20th. Only 28 out of the 118 works shown were by members, but there are only seventeen members. The president, Mr. W. J. Baer, showed five things, of which the one called "Prima Vera" was the only one not a portrait. A more exquisitely decorative little composition would be hard to find anywhere. A joyous little figure in billowy draperies floats across one's vision very like a beautiful dream. We could wish many chances of seeing this in a museum. Mrs. Lucia Fairchild

Fuller still remains one of the most original of the miniaturists. Her "Portrait of a Boy" is a charming color scheme of orange, browns and red, and the face has the fascination of a real child. By Elizabeth Bacon were two very small portraits rather unconventional and delicate in color, and by Edith Kemble Oliver was a "Portrait of Master Oliver Walker," beautiful in color and feeling. The average was high.

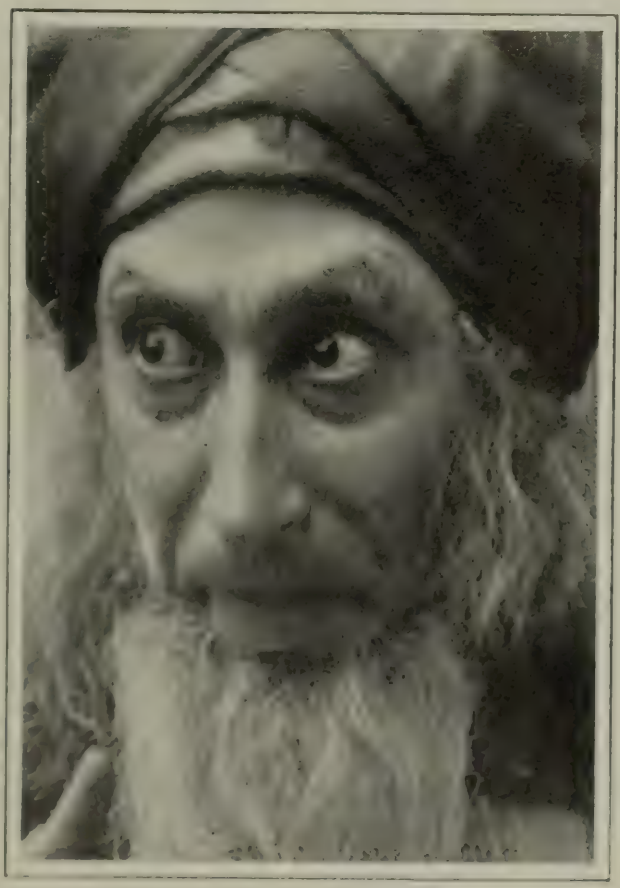
The Art Workers' Club arranged the annual loan exhibition of paintings for the University Settlement, as it has done for the last few years. The opening of the exhibition was made notable by the presence of Sir Purdon Clarke, Professor Seligman, Frank Vincent du Mond and others, who spoke wisely and well of the need of many smaller exhibitions thruout the city.

Several other landscape exhibitions took place during the month, the most notable being those of the works of Van Perrine at the New Gallery, and of Rockwell Kent at Clausen's. Both men live ruggedly and paint likewise. Perrine still paints the mighty Palisades exclusively for themes, while Kent ranges more widely, but feels titanic forces also.

The most important sales were those of the Brandus and Stanford White collections. The first dispersed many fine paintings of both French and English schools, with a few Dutch, Italian and Spanish works, and the White collection contained remarkable objects in all the arts.

The annual report of the Metropolitan Museum tells us that the attendance for the year was 761,476. The largest for a single day being that for February 22d, when 11,775 persons visited the Museum. Appropriations to the amount of $750,000 a year for ten years are to be expended upon the construction of new wings. The library is growing steadily, and so are the various collections, including that of photographs, now numbering 14,000.

One hundred and sixty lithographs of James A. McNeill Whistler were shown at the Grolier Club from April 4th to the 27th. Whistler is best known as a painter and an etcher, but his lithographs shown at the Grolier Club make it manifest that he could, upon occasion, bend lithography to his taste and make skilful use also of this as an artistic medium. As in his more pretentious works, Whistler uses Drury Lane rags, a Chelsea fish-shop, a balcony, a forge, the back of the Gaiety Theater, a barber's shop in the mews, a butcher's dog and other themes that are by no means as promising as they might be, but out of which he creates something that is gilded by his own peculiar art. The Whistler lithographs are growing rare, but, as shown at the Grolier Club, they are on this very account all the more interesting.



The teaching of art in the New York public schools, now under the direction of Dr. James Parton Haney, has exercised a very wide influence. The students are not merely taught to draw in a perfunctory way, or to copy even classical pictures, but the attempt is seriously made to influence the pupils' home life and to give an art complexion to the schoolroom, as well as to such details as the covers of exercise books, school programs, and even the cards of invitation sent out by the schools. So great has been the success attained along these lines that the attention of the Mosely Commission was particularly drawn toward the American methods of art instruction in use in the New York schools. It is now proposed to send, as object lessons, certain exhibits of the results obtained in art teaching from the best schools in about 100 cities thruout the United States to the International Congress on Art Education, to convene in London in 1908. A few examples of the work done by school children were recently on view in the annual exhibition of the Municipal Art Society of New York at the National Arts Club, and received favorable comment. It is hoped by this means to stimulate the existing interest in everyday art as taught in our schools.

Retrospect of the Dramatic Year

It is our custom at this time to select for distinctive mention a very few of the plays which we have discussed during the season now closed. More of our readers will have an opportunity of seeing these plays next year, when some of them will be touring the country, than

on their appearance in New York City, and our dramatic notes may, therefore, save money and time that might otherwise be wasted on inferior productions.

In our opinion the four productions of the season that are most worthy of attention are Ibsen's "Hedda Gabler," as presented by Madame Nazimova, Hauptmann's "Sunken Bell" by the Sothern-Marlowe Company, Jones's "The Hypocrites" and Broadhurst's "The Man of the Hour." Of special interest as indicating the growth of an American school of playwrights using native material are three Western plays: "The Great Divide," by William Vaughn Moody, an emotional drama of much power; "The Three of Us," by Rachel Crothers, a simple story of frontier home life, and "The Rose of the Rancho," one of David Belasco's artistically staged melodramas. This has been something of an Ibsen season; Madame Nazimova made a popular success of "The Doll's House," as well as of "Hedda Gabler," and Mansfield's production of "Peer Gynt" attracted great attention. We have been favored with visits of three British players of prominence—H. B. Irving, a worthy son of his great father; Miss Ellen Terry, who retains much of her old charm, and Forbes-Robertson, who produced Shaw's "Cæsar and Cleopatra" in a magnificent manner. In addition to this must be mentioned "His House in Order," a new society play by Pinero, with John Drew as star; Sudermann's "John the Baptist," beautifully presented by the Marlowe-Sothern company; and "The Reckoning," Schnitzler's "Lieberlei," an unpleasant drama of the "young Austrian" school, admirably acted.

ERMETE NOVELLI AS SHYLOCK.

The Plays of the Month

Very few new plays have been produced in New York this month, and none of them are of the first importance. Madame Alla Nazimova has disappointed her admirers by taking up a trashy Italian comedy, Roberto Bracco's "Comtesse Coquette." The play is more than *risqué*, and her talents are altogether wasted in it, altho, as is not necessary to say, she makes a vivacious and fascinating "coquette." We liked her better when she made her own costumes and played in the little old hall on the East Side than we do in this play, where she is the walking advertisement of a fashionable dressmaker. Why can she not give us "The Master Builder" in English as she used to in Russian? Probably a better Hilda has never been seen anywhere.

Talking of Ibsen, we must not neglect to thank the American Academy of Dramatic Art for the rare chance of seeing the "Vikings at Helgeland," one of Ibsen's early historical dramas. If it had not been stated on the program that it was given by the senior members of the school there would have been no reason to suspect that the actors were amateurs, for it was managed and played in a very effective and business-like way. It could start out on the grand tour without change in the cast, for the play goes better than one would think from the mere

reading of it. Mr. Spiro made a very impressive Ornulf, and Miss Pollock as Hiördis showed great tragic capabilities.

The Yale University Dramatic Association has for the last few years given a play each spring. This year they produced Ibsen's "The Pretenders," in a way which made it a most preposterous conglomeration of all that is repelling in Mansfield's "Peer Gynt" and Mr. Ben Greet's Shakespearian plays. The play, despite its symbolism and historical interest, was disconnected, bare, wooden and with hardly a scintilla of human interest. How the advisors of the Yale students hit upon it, is difficult to see, unless they wanted to give the public something that had never before been seen in America. Yet despite the almost insuperable obstacles furnished by Ibsen, the Yale boys did remarkably well, and one of them who took the part of the wily Bishop was almost the shade of Henry Irving back in life. The play depicts a contest for the Norwegian throne in the thirteenth century, and the characters comprise horned vikings, intriguing bishops, stately maidens (Yale boys), riotous feasts and alarums. The symbolism which seems to be a necessary adjunct of all Ibsen's dramas dealt largely with the superiority of the uncompromising idealist over the compromising practical person.

The visit of Ermete Novelli and his company gave a good opportunity for comparing the Italian style of acting with our own, especially since he included several Shakespearian dramas in his repertory. These were very unlike what we are accustomed to, altho it must be admitted that in some respects, such as that of making Shylock more of a comic than a tragic figure, Novelli was nearer to the original conception than Irving. But his classic plays did not take very well, for Signor Novelli's forte is eccentric character acting, comic or pathetoc, or both at once. In "Il Ratto Sabine," which the program curiously translates as "The Seizure of the Sabines," he takes the part of the barnstormer in a broadly farcical spirit. "Papa Lebonnard," a little family drama by Jean Aicard, gives us a touching illustration of a simple-minded man unfortunately married to a woman of fashion and folly. Novelli's support was on the whole good and the company played together better than most of our American troupes.

"The Silver Box" is a somber, gray, disagreeable but powerful play in which Ethel Barrymore takes the leading role. It describes the vice and misery of the poor and the injustice they receive at the hands of the rich, who are for the most part cruel, snobbish and purse proud. The play has no humor; everything ends unhappily and it is sure to give any one the "blues." It is splendidly acted, however, and is a keen satire on certain phases of life, alas, too common in our day and generation.

The Spring's at the Flood!

BY SUSIE M. BEST

It is April, I see!
The green's in the tree,
The bloom's on the bud,
The balm's in the air,
The birds are a-pair,
The Spring's at the flood,
And plain as can be
It is April, I see!

It is April, I see!
The sphinx-moth is free,
The bee is abroad,
The sunbeam's a-dance,
The world's from the trance,
Pan! Pan is the god!
And plain as can be
It is April, I see!

CINCINNATI, OHIO.

Should the Unwritten Law Be Written?

BY LEWIS H. MACHEN

STATE SENATOR OF VIRGINIA.

STRICTLY speaking, there is no such thing in criminal jurisprudence as unwritten law. What is so called is mere violation of law—the finding of verdicts of acquittal which the law does not sustain.

Every possible point involved in criminal trials has been written down in text-books and decisions and become fixt except as changed by statute. This body of law is as simple and as clearly defined as any with which the courts have to deal. It may be easily applied to the facts of any particular case. Yet in practice it is found that in a certain class of cases juries persistently refuse to enforce the law as expounded to them by the courts. Public opinion approves of such verdicts and sometimes even judges commend the violation of their own charges. The result is a tacit understanding that certain things which the law brands as crimes may be done with impunity. This crystallization of public opinion into custom is what is known as the unwritten law.

Some contend that the principles involved in this custom are correct and should be enforced. Others hold that these principles are incorrect and should not be enforced. And still another class believe that these principles are correct, but think they should not be enforced by juries in defiance of the instructions of the courts which they have sworn to obey.

For example, a father pursues the seducer of his daughter and, after searching several days or hours, comes up with him and kills him. Undoubtedly, under the common law the father is guilty of murder in the first or second degree, according as there has, or has not, been "cooling time." The man is brought to trial. Not one jury in a hundred would fail to acquit. Was the man justified in what he did? Not one man in a thousand would hesitate to answer in the affirmative. Was not the jury, then, justified in finding a verdict of acquittal? That is another question.

If juries may disregard the instructions of courts in one class of cases it is difficult to say that they may not do so in all cases. When jurors become indifferent to the obligation of their oaths it is easy to see that the jury system has been shaken to its foundation. The unswerving fidelity of jurors to their oaths is the chief safeguard of accused persons as well as of society in general. In some cases unjust convictions may be set aside on appeal, but unjust acquittals by juries are irrevocable. If juries may play fast and loose with the law as laid down by the courts it is plain that the administration of the law has been greatly weakened. In order to preserve any show of authority for law juries must uniformly enforce the law as so expounded.

Since the law, in order to protect society, must be uniformly and effectively enforced, it follows that the law should be kept right. But the standard of right in criminal matters varies as knowledge extends and public sentiment becomes more humane and enlightened. A hundred years ago there were more than one hundred capital crimes in England. The methods of punishment, too, were brutal—drawing, quartering, amputation, burnings and brandings. Offenses which were then punishable with death are now considered worthy of slight punishment, or none. It has been found that excessive punishments destroy themselves thru the refusal of juries to convict.

Is there any doubt that the common judgment of men fully justifies homicide committed when the provocation is the invasion of marital rights or an attack upon the virtue of the innocent? And

if public sentiment is against the law as it stands why should not the law be changed? Will not the whole body of the criminal laws be injuriously affected by the attempt to maintain a cadaver in criminal jurisprudence? Is any good accomplished by the periodical effort to put life into this dead letter?

Naturally, there is a reluctance upon the part of society to relax the rigor of the written law. There is a superstition among many good people that the severer the penalties imposed for any offense the more effective will be the law in preventing the offense. The good people leave out of consideration the question of justice. If a few people were hanged for being drunk it is doubtful whether drunkenness would be greatly diminished, but the injustice of such punishment would probably be considered a greater crime than drunkenness. Besides, if such were the penalty few people would be willing to report a case of drunkenness; the police would ignore it; witnesses would be averse to testifying to the facts and juries would refuse to convict upon the plainest proof. The law would suffer by being ignored or trampled upon, but the cause of sobriety would not be advanced.

It is perfectly well understood thruout the civilized world that where a homicide is committed under the provocation of an attack upon the sanctity of the home there is no possibility of any considerable punishment. Yet comparatively few homicides result from such causes. In cases in which they do result officers of the law are frequently reluctant to prosecute; witnesses fail to remember or deliberately misstate facts; medical experts testify that the accused was the victim of emotional insanity which disappeared as soon as the cause was removed and juries ignore the plainest instructions of the courts. The law suffers by being ignored or trampled upon, but the cause of morality is not advanced.

Is it not time that lawmakers and judges were recognizing the fact that in such cases juries will invariably consider the sufficiency of the provocation, and if, in their judgment, the provocation is sufficient they will find verdicts of acquittal? Would it not be wise, therefore, to give the jury the right to determine the adequacy of the provocation? It is a right which they do not hesitate to exercise. Would anything be lost to the cause of order by conceding this right to them as a matter of law?

Such a statute might be drawn thus: "In all criminal trials involving a charge of assault and battery, assault with intent to kill or homicide, in which it is proven that the person upon whom such assault was alleged to have been committed had been guilty of a wrong upon the person of the wife, mother, sister or daughter of the accused, the jury shall be the judges of whether such provocation was sufficient to justify such assault, and may, if such assault was so justified, find a verdict of acquittal."

Some may find fault with the principle of allowing the jury to judge of the sufficiency of the provocation. Yet all law writers and all cases hold that the jury may judge whether the provocation was sufficient to reduce the offense from murder to manslaughter. Why should the jury not consider whether the provocation was sufficient to reduce the act from manslaughter to nothing?

There have been several attempts to modify by statute the strictness of the common law in such cases. Delaware has reduced the killing, by an aggrieved husband, of one found *in flagrante delicto* from a felony, which it was at common law, to a misdemeanor. (Laws of Delaware, 1893, Chapter 127, Section 5.) Texas has made such a homicide justifiable. (Texas Penal Code, Section 672.) And Utah has extended this principle to cases where there have been wrongs upon the person of the wife, mother, sister or daughter or other female relative or dependent. (Revised Statutes of Utah, Section 4168.) It would seem that this Utah statute is too broad in its terms, tho in practice it is probable that juries restrict its application within proper bounds. It will be noticed that by none of these statutes is the jury given the right to judge of the sufficiency of the provocation. A hard and fast rule is established for all cases. Indeed, the supreme Court of Texas set aside a conviction in a case where a husband had been given three years in the penitentiary for a homicide which the statute declared justifiable. (State v. Price, 18 Tex.

App., 474; 51 Am. Rep., 322.) In Maryland, by statute, juries in criminal cases are made the judges of the law as well as of the facts. Yet they are to judge the law from the statutes and decisions, as courts do, and are bound by their oaths to enforce the law as they find it. Therefore juries in Maryland can no more enforce the so-called unwritten law without violating their oaths than can juries of other States. All of these statutes are of long standing and seem to work well in the States which have adopted them, but other States have been slow to adopt them, which indicates that evolution in criminal law is an extremely slow process.

In the meanwhile, criminal trials are becoming ridiculous from the fact that public opinion does not sanction a law prescribing punishment as a common murderer for a man who has been goaded to bloodshed by some dastardly crime against his marital rights or against the innocence of some woman closely related to him. Acute and resourceful lawyers find it easy to present some technical defense which will enable the jury to enforce justice without too obvious a defiance of the law, and eminent physicians can always be found willing to testify that the accused was temporarily or emotionally insane. Brain-storm is a recently discovered phenomenon which will probably reappear in many such cases hereafter, and may be regarded as a useful acquisition to the literature of this subject.

It must not be overlooked that it is always possible to find an equal number of equally eminent medical experts to testify that the accused was perfectly sane at the time the alleged offense was committed. But it would not affect the result if twice as many experts twice as eminent gave such testimony. The jury, being judges of the credibility of the witnesses, will choose to believe those whom they wish to believe. In reality they will ignore the expert testimony altogether and consider only the provocation. If that be found sufficient they will find a verdict of acquittal.

But it should be noted that this indirect method of reaching this result can only be accomplished in the best style by accused persons of large means who are able to employ the deftest lawyers and the most respectable corps of medical experts. In these cases the State is put to a corresponding expense in the vain effort to overcome this array of legal and medical talent. A poor man, especially if not socially prominent, has a somewhat more difficult time of it and runs a greater risk of a triumph of law over justice. But even in his case, if the provocation be real and adequate, he may account himself reasonably safe.

Is it any wonder that people smile at this contravention of the law? The public becomes accustomed to the spectacle of juries pretending to believe the incredible and serenely disregarding the plainest instructions of the courts which they have sworn to obey. The old reverence for the jury system is thereby diminished, and, indeed, the whole administration of criminal law falls under suspicion, if not reproach. Can there be any doubt that such a condition is deplorable? What is the remedy? It would be impossible, even if it were desirable, to change public opinion regarding the provocation mentioned. The man who invades a home for an immoral purpose becomes an outlaw whom the aggrieved party may kill with impunity. It matters not that the law may classify the killing as murder or manslaughter. The body of the country, from whom the juries are taken, do not recognize such a classification. This we must acknowledge, and proceed to ask the pivotal question: Would it be wise to concede to juries the discretion which they already exercise in such cases?

The objection most frequently heard is that men might be encouraged by such a law to kill persons upon slight suspicion. The answer is that the statute suggested would be restricted in its application to cases in which the provocation shall have been proven to be real. Under such a statute no man would be permitted to act rashly upon mere suspicion or hearsay and claim justification. Such a claim is made in just such cases under the practice now prevailing.

The whole matter of justification is now extra-legal and can be introduced only thru some subterfuge such as a fictitious plea of temporary or emotional insanity. Therefore, the scope of such

testimony is not limited to cases in which the provocation was real. Under the insanity plea the only relevant inquiry is whether such a story was told the accused. The State cannot show the untruthfulness of the story itself. By this method the jury may be regaled with many weird and fantastic tales, which they must technically consider only as bearing upon the sanity of the accused, but which they really consider as bearing upon the provocation.

If, however, the provocation were a matter which might be lawfully considered the State would be permitted to show that in fact no such provocation existed. The court might instruct the jury as to the necessity of the complete proof, by the defense, of the reality of the provocation and the State's attorney would have the opportunity in his closing address to appeal to the jury not to abuse the discretion which has been invested in them to judge of the genuineness and weight of such provocation. Would not this latter method circumscribe the activities of spellbinding attorneys for the defense who, under the guise of discussing the effect of some event or narrative upon the mind of the accused, in reality inflame the minds of the jury by portraying the enormity of the provocation?

Some have expressed fear that such a statute might encourage the manufacture of false defenses and thus render the punishment of murderers more difficult. But enough has been said to show that we stand in that predicament now. Indeed, there is greater danger thru the present system that some such imaginary plea will be put forth under the guise of testimony regarding the sanity of the accused. But if a plea be just it should not be disallowed merely because it may be abused. Unquestionably, the plea of self-defense is subject to abuse. The same may be said of the law excusing the violent acts of insane persons. Yet no one calls for the abolition of these defenses. The better plan would be to write into the law the principles which are believed to be just and trust the people to apply them in such manner that they may not constitute a cloak for crime.

Finally, the issue presented is whether the juries of the country may be trusted to judge of the adequacy of the provocation in the class of cases mentioned. If that question be answered in the negative how can the conclusion be escaped that the jury system is a failure and no longer competent to decide issues involving the life, liberty and property of the citizen?

RICHMOND, VA.

But Spring Returns!

BY MARIAN WARNER WILDMAN

"THE time of the singing of birds is come!"
  Once more, old poet and king,
"The voice of the turtle is heard in the land!"
  Again is the marvel of Spring!

Was it dear to you—was it wonderful,
  Those thousands of Springs ago,
As it is today, with the greening grass
  And the shrinking lines of snow,

And the maple boughs all crimsoning
  To the rush of the April wine?
Today, when the world is a sunlit haze,
  A vision, a dream divine?

On the shoreless sea of the Infinite
  We are ripples that fall and rise.
In a few more Springs, O Solomon,
  I, too, with the dust in my eyes!

But none the less, for a thousand years
  And a thousand years again,
Shall Spring return with her healing gift
  Of joy to the sons of men.

And the time of the singing of birds shall still
  Be thrilling and sweet and strange:
For the Beauty we worship abides—abides!
  Tho the worshipers pass and change!

NORWALK, OHIO.

A Tragedy Among Nations

BY WILLIAM T. ELLIS

[Mr. Ellis is a member of the editorial staff of the Philadelphia *Press,* and is now in the Orient, personally visiting the unhappy nation about which he writes. This is the first comprehensive article, of which we are aware, telling of the Japanese invasion of Korea.—EDITOR.]

THERE is trouble in Korea. That would be what editors call "unimportant local news," were it not for the fact that the present trouble, like the smallpox, may spread thruout the neighborhood, and what is now only sunset turmoil in the "Land of the Morning Calm," may grow to be international war. For it is quite within the range of possibilities that, with or without desperate action by the over-patient topknots, the situation in Korea may be made a pretext for war by one or more of the Powers unfriendly to Japan—especially since the Korean Emperor appears to be appealing from his palace-prison for such succor. Even if these serious consequences be escaped, Korea's cause will be presented to the Hague tribunal next spring, and it is worth while for the world to know the "story" back of the appeal.

The root of all the evil is money. For centuries, Korean officeholders have been

ONE OF THE GATES TO THE CITY OF SEOUL
The monkeys on top are supposed to keep out evil spirits

"squeezing" the people, until the peasant, who is "the ultimate sponge," has had most of the juice of virile, aggressive, independent manhood squeezed out of him. The nation's history of four thousand years has flowered only in hopeless corruption. The worst municipality in America is a Sunday school in its politics alongside of the official life of Korea. This state of affairs—to look on the bright side—has taught the people forbearance, patience and good nature, virtues which they did not need.

THE EMPEROR OF KOREA.

Such a nation, considering its geographical position, could not be otherwise than a fertile field for the intrigues of China, Russia and Japan, all of whom wanted to control the strategic peninsula and its twelve millions of people. The court of the fearful and feeble monarch at Seoul was and is, within a single year, the scene of sufficient plots and counterplots to furnish an army of yellow novelists with material for a decade. Both Russia and Japan quickly cuffed rheumatic old China out of the game, and latterly the little people to the south have bested Russia at intrigue, as at arms. So Korea lay at the mercy of Japan.

It did not suit the purposes of the latter, and it would really have been impolitic, to annex Korea at once. The latter was an independent nation, having treaties with the great nations of the

earth. But, in one way and another, Japan's control increased to the degree that, in November, 1905, she offered to Korea a treaty giving the actual management of the nation's affairs over into the hands of the Japanese.

This incident was sensational enough to satisfy the most jaded lover of blood-and-thunder literature. Marquis Ito, the Japanese Resident-General, who had undertaken the rehabilitation of Korea, led a company of Japanese soldiers into the cabinet meeting where sat the Korean King and his counselors. This treaty, which practically brings to an end Korea's existence as one of the two oldest nations on the earth, was offered to the King and cabinet to sign. They refused. The Japanese urged, argued, cajoled, blustered, threatened—all in vain. Swords were drawn and recalcitrant ministers were threatened with death. The cabinet meeting was dissolved and to convene it. The Japanese went ahead anyway, without a properly called cabinet session. The Minister of Finance signed, and the Prime Minister promptly slapped him in the face and called him a traitor. The Prime Minister himself never signed the "treaty"; neither did the King. The latter afterward gave out a letter, under his own seal, declaring that he had never signed, and that the treaty was null and void. From four distinct and trustworthy sources I have had assurance, while in Seoul, that the story really happened as related above, and that the King is still opposed to the Japanese usurpation of power. The Japanese officials refused to let me see the King, altho I asked permission of Marquis Ito himself. I was informed by those in close touch with his Majesty that he would be willing and glad to give audience to an American journalist. But the King is a prisoner in one of his own

GATEWAY TO THE PALACE WHERE THE KOREAN QUEEN WAS MURDERED

the Japanese efforts continued with individuals. Some of the weaker men were overcome.

Then Marquis Ito ordered another meeting, but the Prime Minister refused

palaces; nobody is allowed to see him without a Japanese permit.

Yet this very "treaty," which Japan proclaimed as genuine (altho she has since hedged on the matter of the royal

signature), engaged to uphold the dignity and authority of the imperial household, and to respect the autonomy of the Korean Government. According to the story given to the world, Japan's purposes in Korea are purely missionary. She is, at great cost to herself, doing an altruistic work of civilization.

Certainly she undertook a hard job, whatever her motive. The railroad from Fusan to Manchuria has been built and is in good running order. The post office is being reorganized by the Japanese and will one day, it is hoped, become as effective as that in Japan. After a deal of juggling with the currency which hit the Koreans hard—tho the Orient should be accustomed by this time to the hardships of varying fiscal values—a uniform Korean coinage is in sight. There is talk of the general introduction of education, and a beginning really has been made, the use of the Japanese language being obligatory in most cases. The Japanese soldiers and police also control the country.

Whatever is creditable and unselfish and useful in this must be marked up to Japan's credit. And always it must be borne in mind that, as W. D. Stevens, an able and affable American who for many years has been in the employ of the Japanese as an adviser, said to me in Seoul, the Japanese have had to work with an utterly corrupt and inefficient Government. Nobody who knows the situation thinks for an instant that Korea is at present capable of any decent or proper sort of self-government. She must be in leading-strings to somebody for years to come.

Here comes the nub of the story: Korea, despite her shortcomings, deserves the treatment due to human beings, possibly that due to an undeveloped people. On the contrary, she is being treated as a conquered country. Japan had a rare chance to win the friendship of the Korean people; instead she has alienated them to a man. In violation of all treaty stipulations, and of those considerations of human justice which the world holds dear, this nation, nominally independent, is daily enduring the indignities and ignominies sometimes inflicted upon a subjugated race. As one American in Korea said to me, "If Japan would only treat Korea with half decency nobody would object. The Korean is used to injustice and can stand a lot of it; but that is no reason why he should be treated worse than a dog." This American went on to declare, what I have heard stated a score

YE SANG CHAI.
Secretary of the National Cabinet of Korea.

of times in different parts of Korea, that there is today not a white man in all the land (except the adviser to the Japanese Government), who is not bitterly opposed to Japan's course, altho practically all of them, until the close of the Russo-Japanese war, were ardently pro-Japanese. From diplomats, business men, professional men, mining engineers and missionaries, I have heard a succession of tirades against the Japanese. Some of these, notably the missionaries, are sincerely and discreetly abstaining from anything that savors of political activity; but they quickly open up to an American and express themselves in most pronounced terms. Even the leading Koreans with whom I have talked, while they are eating out their hearts in the bitterness and shame of their nation's wrongs, are not more intense in their condemnation of the Japanese than are the white foreigners. The business men among the latter have,

in addition, a personal reason for resentment in that they say Japan, by unfair means, is crowding out all interests except Japanese from Korea and Manchuria.

To be more specific, without attempting to cite the innumerable individual cases of which I have either first-hand or other creditable information. What is the Japanese conduct complained of? First, I suppose should be put the imprisonment and humiliation of the King. Then comes the galling substitution of Japanese for Korean authority, from the policeman up to the Resident General. Korea is a nation without power, altho enough of her machinery of Government remains to make her a convenient scapegoat for the Japanese when called to book by foreigners.

Most direct and annoying of all, tho,

MAJOR-GENERAL MIN YUNG WHAN.

General Min, Ex-Prime Minister of Korea, committed suicide when the protectorate was announced. His house is now occupied by D. W. Stevens, an American, adviser to the Japanese.

is the conduct of the Japanese toward the Koreans. We do not treat street curs in America as the lowest Japanese coolie feels free to treat a Korean gentleman. Only this morning, the Japanese porter carrying my bag (Koreans are not allowed to ply any lucrative occupations on or near the railways or steamboat landings) wanted to pass an elderly Korean, who stood with his back toward us, in the railway station. Did the coolie turn to one side, or ask the other to move? Not he; with an imprecation, he gave the man a shove that knocked him out of the way. That sort of thing is so general that the sixty thousand Japanese now in Korea are feared by the twelve million Koreans to the point of abjectness; for an appeal to Japanese official justice seems to bring nothing but increased trouble.

A Japanese broke into the house of an English-speaking Korean whom I know, because the latter would not sell his property at the Japanese figure, and smashed the furniture, ornaments and a hanging lamp. The Korean, with the help of another, tied the offender to a chair and sent for a policeman. When the latter came the only crime he would consider was that of "a barbarian's tying up a civilized man," and he took away as evidence the rope with which the Korean had committed this heinous offense! Is it any wonder, as one of the leading natives in all Korea said to me, that the villagers thruout the country would rather see the black death enter their community than a Japanese?

So much of this sort of thing have I seen with my own eyes, and so thinly-veiled has been the hostility and insolence of the lower class Japanese toward myself and all other foreigners, that, bearing in mind the repeated assaults upon white men known to me, I have gone armed daily for the first time in my life. Yet the word that is ever passing among the foreigners is, "Don't pay any attention to insolence and insults, and do not hit back unless your life is endangered." The self-conceit, arrogance and license of the Japanese in Korea knows no bounds. Nor can the Government which so completely controls the people in Japan, truthfully disclaim responsibility for this state of affairs.

From all parts of the country come reports of the forcible dispossession of Koreans from their homes in order that they may be occupied by the Japanese. "Military necessity," has been the convenient pretext under which thousands of acres have been seized without compensa-

tion, and thousands of Koreans compelled to work without pay. And military operations, on a large scale, really are in evidence in many parts of the land.

I have seen small cities where almost the entire business section has been taken possession of by the Japanese. Even the wealthy have exhibited to me the same terror which possesses the poor, namely, that the Japanese will seize their lands and homes. One American friend of the natives showed me a bundle of deeds to houses and lands that was three feet in circumference. The deeds were done up into packages, of which I counted forty-four; the aggregate of individual documents must have been more than two hundred. These have all been brought to the American for safety by alarmed Koreans, and he has bought them for a penny apiece. Thus far, a foreigner's ownership of real estate has been usually respected, and the natives have turned over their property in this manner in order to keep it out of Japanese hands, hoping for the day when security for life and possessions will come to Korea.

Japan's conduct in Korea, as any traveler may see it (tho travelers seem to be far less welcome in this picturesque country since Japan gained control than they are in Japan itself), is such as to afford the best material for a new Zola to arise and startle civilization with a *"J'accuse!"* For instance, it is undeniable that up North the military—whether officially or unofficially matters not—quartered their female camp followers upon the natives, with such scandalous results that the church officials compelled the Korean Christians to abandon their homes rather than to endure and witness the demoralizing use that was being made of them. Everybody knows that the Japanese have put into high places some of the worst rascals in that choice collection of superlative rogues, the Korean officeholders, thus making ludicrous her pretense of "reform."

A STUDY IN HATS.
The Seoul Y. M. C. A. secretary and some leading members out to call on officials.

While I was in Korea the story was published and later authenticated, that a young Japanese had tried to force an old Korean out of his home. The latter refused to give up his ancestral habitation. Thereupon the Japanese set upon him and beat him, tied a beam to his shoulders, weighted it with stones, and then strung him up to the eaves of his dwelling, where he died in agony. When the murdered man's son returned and discovered the crime, he and some friends started in pursuit. The murderer fled across a river; the avenger, with a knife in his teeth, swam after him. The fugitive was caught and killed, and—remember that Korea is in the Orient, with immemorial customs—the heart and liver of the criminal were offered as a sacrifice to the spirit of the slain Korean. Of course, this was wrong—one crime never

justifies another; but the deterrent effect will doubtless be greater than the example made of another Japanese slayer of a Korean, who was sentenced by the Japanese to an imprisonment of two years! The instance is one of several reported of late which would seem to indicate that, driven to bay, the long submissive Koreans are desperately refusing to continue to play the rôle of "dumb, driven cattle."

Will Korea's day ever come again? Is Japan going to succeed in her apparent purpose of eliminating the Koreans, as she once eliminated the Ainus, and as the white men eliminated the North American Indians? Whence is help to come for the poor Korean, who, while he lacks the enterprise and self-confidence of the Japanese, is in certain important respects his pronounced superior? His present afflictions, by the way, are really waking up the Korean's dormant qualities. Some Koreans are looking hopefully to the meeting of the Hague tribunal next spring. Others expect that Russia, when rehabilitated, will make common cause with her, or that Germany will express her belief in the "yellow peril" doctrines of Emperor William by coming to the help of Chosen. Still others, more far-seeing, point out that Japan's conduct in Korea, of which China must be perfectly aware, will prevent the Japanese from ever getting a foothold in China, and may eventually lead Korea's ancient suzerain to reclaim her former dependency. Foreigners seem to think that an enlightened and aroused public opinion in Great Britain and America will do what force of arms may not do, for Japan cares more for the public opinion of civilization than for any other power. Succor for poor Korea surely will come from some quarter, for the unendurable cannot be interminable.

SEOUL, KOREA.

Topics in London

BY JUSTIN McCARTHY

THE fate of the measure for woman's suffrage brought into the House of Commons by Mr. Dickinson, a representative of one of the London constituencies, has been the topic of very general and very animated discussion during recent weeks. My readers in the United States do not need to be told that the measure was rejected by a considerable majority. It will, of course, be introduced again, and will, I presume, be introduced again and again, until it succeeds in passing thru the House of Commons and being sent on to the House of Lords, if that institution should still be existing in anything like its present form and with its present name. I feel quite assured that the admission of women to the electoral franchise on the same terms as men is certain and before long to become a part of our constitutional system. There does not, however, seem much likelihood of any measure for that purpose having a chance of being brought to success during this session of Parliament, so important and so pressing are some of the reforms which the Liberal Ministers have pledged themselves to introduce. The talk in London just now is not so much about the actual merits of the proposed legislation as about the conditions under which Mr. Dickinson's measure was introduced. People are eagerly asking themselves what the Suffragettes will do next—whether they will make other attempts to storm the House of Commons, whether they will assail the Prime Minister's official residence, whether they will start new processions from all parts of the country to invade London, or whether they will call for a general strike of women in all occupations and with the assistance of women who have no occupation whatever. The approaches to Westminster Palace, where our Parliament holds its sittings, are still carefully guarded every day and night by a large

force of policemen ever on the lookout for the invasion of some Amazonian army bent on carrying all before it in the cause of women's rights. Then, again, there is much discussion as to whether the extreme measures and the very unpicturesque measures of the Suffragettes have done more harm or good to the cause which they are advocating. With regard to this question I think there is much to be said on both sides. There can be no doubt that the Suffragettes have made themselves very ridiculous in the eyes of almost all impartial and reasonable observers, and that their violence has for the time at least turned many against their claims who were already well disposed to accept the principle of woman's suffrage. But then, on the other hand, one cannot help remembering that few measures of reform, especially of reform in our electoral arrangements, have ever been carried without some vehement and threatening displays of popular violence, some tumultuous demonstrations of revolutionary fervor, some passionate resistance to the established authorities and the forces under their control. We remember that what were called the Hyde Park riots brought about some satisfactory results,

W. H. DICKENSON, M. P.

and we know that one very popular leader of workingmen who is now a distinguished and universally respected member of Sir Henry Campbell-Bannerman's Cabinet was, and not so very long ago, regarded by the ruling classes as a violent and dangerous anarchist. I cannot bring myself into any approval of some of the displays lately made by the Suffragettes, but at the same time I cannot help thinking that even the very storm of indignation those displays have created thruout England may at least have the effect of compelling our lawmakers to recognize the fact that the whole question is forcing itself on for early consideration and cannot any longer be regarded as a mere theme for the mirth of "Punch" and the scorn of society journals. We do not, in fact, pass measures of reform in this country under the influence merely of calm, philosophical argument. Since our earliest days of constitutional and parliamentary government we have always needed tumultuous and threatening demonstrations of some kind to rouse us into a recognition of the fact that there is a knocking at the doors, and that if we do not open the doors they will be forced in upon us before long. With these recollections in one's mind it is not quite easy to say whether even the ungraceful and unwomanlike demonstrations of the Suffragettes may not, in their own way, contribute some help to the success of the cause which they are meant to advocate. I wish I could believe, as many of my friends do, even among those who are sincere advocates of the franchise for women, that such exhibitions have only injured the cause, but I have seen too much of public life and have too good a memory of many a crisis in the history of our own times to come to any such conclusion.

There is a general belief thruout the country that the forthcoming budget of the Chancellor of the Exchequer will contain some proposal for the establishment of that system of old age pensions which has so long been talked of and promised on and from both sides of the House of Commons. It will be remembered that Mr. Joseph Chamberlain seemed some years ago to make such an institution the great object of his public career, but when Mr. Chamberlain came

into office, and with his son as Chancellor of the Exchequer, he does not, somehow, appear to have found time or opportunity for turning his attention to any practical realization of the scheme. The breakdown of his health must now, as far as outer observers have any means of judging, render his return to public life only at best a remote contingency. The Chancellor of the Exchequer, Mr. Asquith, has much important work to undertake in the preparation of his financial scheme, but it is confidently announced by some of the Liberal newspapers that the creation of an old age pension system will be one of the measures which he is determined to accomplish. Mr. Asquith is one of the most brilliant debaters in the House of Commons. He won his reputation first as an advocate at the bar, and then was elected to Parliament, where he soon made himself a conspicuous figure. He held the office of Home Secretary in a recent Liberal Government, and proved himself a man of thoro official capacity. He is a favorite among all who know him because of his charming manners, his bright conversational powers and his genial humor, while the man himself has deeper thought and more deliberate purpose than many of those who meet him mostly in social circles might be led to suppose. Should he succeed in establishing what may be called the nucleus of an old age pension fund, he will have won a memorable place among the founders of abiding reforms. The principle of the old age pension fund is simply to initiate, from the national exchequer, a means by which the poorest of our populations may be enabled to effect, on the cheapest terms, an insurance on their lives which will give them, when they attain a definite period of old age, the means of living the remainder of their days in comparative comfort. The cost to the state would not in any case amount to much of an added burden, for it must be remembered that a large mass of our poorer class become paupers when they sink into old age and have to be maintained, in or out of the workhouse, at the cost of the community. Mr. Asquith will, of course, have some great expenses to provide for in his budget this session, but then he has had the

H. H. ASQUITH.

advantage of coming into office at a time when the income of the exchequer has been immensely raised by the great increase in the manufacturing and industrial prosperity of these countries. This would, therefore, seem to be a most favorable moment for a definite and successful attempt at the foundation of that old age pension fund which may well be destined to convert premature pauperism into honest poverty, independent and to a great extent self-maintained. Honest poverty might then, indeed, to adopt the words of Robert Burns, "dare be poor" nor hang its head for shame.

It might seem, perhaps, hardly fair to expect that my American readers could take much interest in the municipal contest for the election of members to the London County Council. But such a contest has to do with the interests of constituencies whose population would compare in numbers with that of many of Europe's smaller kingdoms and the London County Council is an institution of entirely modern birth, a complete revolution from the antiquated and much ridiculed, very justly ridiculed, systems by which the metropolis used to be governed. I may add that two members of

the County Council are distinguished members of Sir Henry Campbell-Bannerman's administration. The County Council is elected for three years and its triennial reconstruction has just recently taken place. Public opinion in these parts was more aroused by the contest than by any other recent subject of disputation, if only I must except the doings of the Suffragettes. The contending parties in the great contest were divided into the Progressives and the Moderates, terms which may be said to represent in meaning the Liberals and the Conservatives of political controversy.

The Progressives or Liberals were this time completely defeated and the Moderates carried all before them. The Moderates had the good luck, or the happy ingenuity, to affix upon their opponents the title of "The Wastrels," and in all their election addresses, proclamations and placards, and in all the newspaper articles written on their side of the controversy, the Progressives were invariably held up to public horror and hatred by that peculiar appellation. Now it is easy to understand how the honest middle class or lower middle class burgess is touched to the very heart, or, perhaps, more especially touched to his very pocket, by a name which suggests to him that those on whom it is conferred have been squandering the municipal rates he has to pay in prodigal and wasteful expenditure. The Progressives did, while they were in power, introduce many costly schemes for the improvement of London and one of these schemes, in itself apparently well-conceived and promising, turned out to be unsuccessful and the average ratepayer was easily therefore filled with the idea that all other Progressive schemes would be likely to meet with the same fate and that therefore the convicted Wastrels must not be allowed any further opportunity of wasting the funds of the metropolis. Thus the so-called Wastrels are out except for a small minority, and the so-called Moderates are in and are secured a course of three years in which to show what use they can make of their municipal sovereignty. The Progressives will do well, I should think, to set their wits to work for the purpose of discovering some title of effective and seemingly appropriate disparagement to apply to the conquering Moderates.

I have before me two thin paper bound handsomely printed little volumes bearing the name of "Democratic Sonnets," and published by Messrs. Alston Rivers, Ltd, London. These "Democratic Sonnets" are the work of William Michael Rossetti, brother of the great poet and painter Dante Gabriel Rossetti, who died in 1882. William Michael Rossetti has made a name for himself and a name of great and genuine distinction as a biographer, an essayist and a critic, and his work, "Some Reminiscences," published last season by Messrs. Brown, Langham & Company made for itself a complete success. The two little volumes of sonnets which I have now before me were written, most of them, many years ago, but very few of them were ever given to the world until their present issue. The sonnets in these two volumes are well entitled to have, and I fully believe are sure to have, as cordial a welcome in the United States as in this country.

Each one of these sonnets speaks out the author's mind and heart on all the great national and international questions on which they touch and proclaim him to be a devoted lover of truth, peace and freedom, of every good cause, and an opponent of tyranny and oppression under whatever title or under whatever flag. There are four of these sonnets which are addressed to America, one among them being dedicated to Abraham Lincoln, and I am much mistaken if these sonnets do not touch the heart of every American reader. William Michael Rossetti has been a friend of mine for many years and he came to see me at my out-of-the-way little seaside home only a few months ago, where we had many talks over old times and over old friends dead or living. He is a man of the most sincere nature and the most utterly unaffected ways, a man who would not listen to any commendation which he believed to be merely the outcome of a desire to show one's friendly inclination, and it would never occur to me to put into print any words of praise for a work of his which were not according to my sincere judgment its absolute due. In that sense I commend these sonnets to American readers.

Literature

The Censorship of Literature

Of few historical works now coming from the press may it be said that they fill a real need, and cover ground not already traversed and re-traversed by authors almost without number. But Dr. Putnam's history of the Index,* of which the first volume—soon to be supplemented by a second—lies before us, is in the truest sense of the word an urgently needed work for the English-reading public. It is strange, indeed, that our English historical literature has had to wait so long for an adequate account of one of the most momentous institutions of Christian times. It is as impossible to gain a comprehensive understanding of the history of modern intellectual culture without taking the Index into reckoning, as it is to acquire a respectable knowledge of the history of religious toleration while leaving out the Inquisition. This latter institution years ago found a competent chronicler in Dr. Lea; and we may be grateful that another American scholar has at last furnished us with a history of the other of the two millstones that hang about the neck of official Catholicism. The Germans, of course, were already in the field; and it is no disparagement of Dr. Putnam to say—he would be the first to admit it—that the monumental work of Heinrich Reusch, "Der Index der Verbotenen Bücher," is not only incomparable in its subject-matter, but is one of the finest historical achievements of the nineteenth century.

The present volume gives the history of ecclesiastical censorship from its beginning in the year 150 to the controversies stirred up by the bull "Unigenitus," in the middle of the eighteenth century. Protestant censorship as well as Catholic is described; for, as our author points out, the early reformers were even more intolerant of disquieting publications than the Roman theologians themselves. But from the nature of their fundamental principles, Protestants could not long tolerate this species of intellectual despotism; and so it happens that nineteen-twentieths of the history of prohibitive book-legislation has to do with the repressive tribunals of the Roman Church. And a most sorrowful story it is—to none more sorrowful than to enlightened Catholics who love their Church for its spiritual power and its many beneficent influences, but are grieved and humiliated that in this twentieth century it still wields that awful instrument of barbaric tyranny which has crushed so many noble minds, and so seriously threatened the general progress of human knowledge. Dr. Putnam is entirely within the limits of exact truth in saying that a large proportion of the books which have marked epochs in the advance of scholarship have been listed on the fateful catalog of the Roman Index. From Francis Bacon and Richard Simon to Alfred Loisy and Antonio Fogazzaro, few have been the great men of creative minds that have not been condemned. Even Andrew Lang, the urbane friend of all the world, has not escaped.

Dr. Putnam has accomplished his difficult task with conscientious thoroness and complete scientific impartiality. If we may suggest a possible improvement in the work, we would observe that the medieval prohibitions of Bible-reading in the vernacular are too summarily dismissed. It would have been well, to our thinking, to translate Reusch's brief but weighty paragraphs on this matter, *in toto*. Again Dr. Putnam gives us too few specimens of condemned propositions. He cites four or five from Quesnel; and if he had done the same for Eckhardt, Marsilius of Padua, and Wiclif, it would have decidedly added to the vividness and precision of his narrative. Finally, to speak of a small thing in itself, but one on which scholarly readers will be sensitive, we trust that the next edition will correct the typographical errors which have crept into the Latin citations.

* The Censorship of the Church of Rome and Its Influence Upon the Production and Distribution of Literature. *By George Haven Putnam.* Vol. I. New York: G. P. Putnam's Sons. Two vols. $5.

"Thalassa! Thalassa!"

THE historical novel has passed into a state of innocuous desuetude after much abuse: the realm of Zenda has been mapped until true romance has been driven beyond its borders; the amateur detective no longer charms. To be sure, "romance brings up the nine-fifteen" nowadays, the stock-ticker ribbon now is the narrow path that leads thru regions of wildest adventure to love and matrimony, political corruption the new fire that purifies and exalts character, with the same reward at the end; but yet we would occasionally ramble away from the things that are familiar, to be happy once more in an irresponsible way, to be stirred by virtue doing desperate deeds of derring-do and foiling desperate villains in realms that are strange. And so, in this season of publishing, we go down to the sea in ships with trudging sail or dial marked full steam ahead—you can take your choice.

Stewart Edward White and Samuel Hopkins Adams have discovered a new wand to conjure up the old magic, they have proved the truth of Kipling's assertion that the king is immortal. A United States cruiser, a schooner abandoned under full sail, a scientist in search of an element more potent than radium, an uninhabited island in the vast Pacific, and a band of cutthroats—these be, indeed, ultra-modern or dangerously familiar ingredients to use in the concocting of a new tale of adventure. But the mixture is uncommonly effective, thanks to the authors' cleverness. Their book stands the final test: It convinces the reader for the moment. The pirates of *The Mystery*,[1] one thinks, would have warmed the cockles of Stevenson's own heart.

Stevenson remains the modern master of this *genre*. He compels the comparison. Mr. A. T. Quiller-Couch, indeed, forces it upon the consciousness of his readers. *Poison Island*[2] is fashioned entirely upon the model of "Treasure Island," and one is not allowed to get away from the memory of it. It is all here once more. The haunted possessor of the map of the treasure island, the boy who comes into its possession, the expedition, the villain, the search, the mystery, the whole scheme, ingeniously rearranged, complicated and changed, but unmistakable, none the less. Nor does the new presentation improve the material. Of course, *je prends mon bien ou je le trouve* is a legitimate maxim, but be sure that yours is the power to give it new life. It is here that Mr. Quiller-Couch has failed. His whimsical humor plays with the story, to let you know that he is well aware of your thoughts, that he is not for a moment bent upon deceiving you, but this only adds to the disappointment; and the polished villain, grown philosopher now that he is old and master of the treasure, fails to interest you. In fact, after you have laid down the book, no character, no dramatic situation, remains in the memory—nothing but a general impression of misapplied and wasted cleverness.

Mr. Bullen need not invent his romance: he has lived it. *Frank Brown, Sea Apprentice*,[3] is a narrative of the real life of the sea under sail, but thinly disguised as fiction. A voyage between Liverpool and San Francisco, another between the same port and India, a derelict brought into port with its valuable cargo of mahogany, a shipwreck—that is all, but it suffices to weave the charm, to make one overlook the absence of the conventional heroine, even though the rescued Italian captain's daughter kisses Frank on bidding him farewell. This is the author's only concession to one of the confirmed habits of fiction. Yet, if you have ever taken your turn at the wheel in a stormy dog-watch, if you have ever furled a maintga'nsel" in the teeth of an oncoming squall, you will like his book best of all. It is the real thing put on paper with authoritative skill.

Max Pemberton's *The Diamond Ship*[4] is, in the last analysis, not a sea story at all, but a detective story with its scenes laid on a yacht and a converted cruiser, and with an island thrown in for good measure—the formula again, one sees. There is mighty little seamanship in this story, very little of the atmosphere of the unbroken horizon, nothing but preoccupation with the furtherance of a

[1] THE MYSTERY. By Stewart Edward White and Samuel Hopkins Adams. New York: McClure, Phillips & Co. $1.50.

[2] POISON ISLAND. By A. T. Quiller-Couch. New York: Charles Scribner's Sons. $1.50.

[3] FRANK BROWN, SEA APPRENTICE. By Frank T. Bullen. New York: E. P. Dutton & Co. $1.50.

[4] THE DIAMOND SHIP. By Max Pemberton. New York: D. Appleton & Co. $1.50.

plot that has been constructed with an indifference to the reader's sense of probabilities and possibilities which is little short of insulting. A veritable pot-boiler of the poorest quality.

The French Revolution

THE tide of literature on the French Revolution and Napoleon I continues to rise and threatens to engulf both the specialists who are gratuitously supposed to have time to read books and the collectors of the sets who have money to spend. The French Government, under the impetus given by M. Jaurès, is busy printing documents and papers which will in time enable us to get a sound view of the fundamental political and economic aspects of the great transformation; studies of minute questions such as the doings on the night of the 4th of August are almost weekly coming from the press; and leisure class excursionists into the field of literary diversion continue to make contributions in lighter vein.

With true feeling for popular interest in the personal and anecdotal features of the Revolution, Lippincott's offer three new books*—one on men and women of the Revolution, a second on the famous flight of the royal family to Varennes (an episode which inspired one of Carlyle's most famous passages) and a third on Napoleon at Elba. The first by Mr. Gibbs does not pretend to be a history but rather a psychological study of some of the great actors in the drama. It introduces us to the court of Versailles, the philosophers, Mirabeau, and the Estates General, Lafayette, Marat, Desmoulins, Danton, the Royal Family, the leading Girondists, and, finally, of course, Robespierre, the terrible. The volume contains nothing that is particularly new or valuable for any one familiar with any elementary treatise but it is written in a vigorous style that will doubtless please the public to which it is addressed. On the whole Mr. Gibbs is chary of extremes. For example he will not accept Carlyle's view of Marat (a good thing, too); neither will be accept the perverse Bax dictum that he was "an exceptionally noble and disinterested character." Nevertheless, it may be questioned whether Mr. Gibbs has gone into the economic and political movements of the time to warrant his rendering a judgment at all (if such a thing be within the historian's province) for he seems to be dazzled by such an ancient fiction as "the fine frenzy of enthusiasm" with which the nobles on the 4th of August surrendered "all their medieval claims upon the service and property of the peasants" (page 167). Moreover, there is the usual Anglo-Saxon complacency about the "fickle French" who tore the remains of Marat from the Pantheon and threw them into a common burial lot. What did the fickle English do with Cromwell's remains—leave them resting in the great English Pantheon? Hardly. They dragged his body out, hanged it in chains for public gaze, and then threw it into a pit. All in all, however, Mr. Gibbs has succeeded in producing a book that is more readable (especially to those who dote on adjectives) than our old friend Dryasdust's, but there is a certain persistent striving for dramatic effect and high phrases that gives the narrative a false note very often, as, for example, when he says that Siéyès occasionally uttered words that changed the destinies of France (page 122). There is too much talk about "curdled blood in the gutters of Paris," "hiss of the broad blade of the guillotine" and the like, but it will not interfere with the sale of the book. The typography and illustrations are good—the latter alone being worth the price of the volume.

More important is the second of the three books, *The Flight of Marie Antoinette*, by M. Lenotre. It is a scholarly and documented account of a striking episode, told in an entertaining fashion. The volume gives the most elaborate and detailed narrative of that bold enterprise from the laying of the plot to the disastrous ending in the capture and return of the royal family to Paris. The whole is based on manuscript and printed sources and is well illustrated by plans, portraits and prints. It is useful to both the professed student and the collector of anecdotes.

* MEN AND WOMEN OF THE FRENCH REVOLUTION. *By Philip Gibbs.* Pp. 390. Philadelphia: J. B. Lippincott & Co. $7.00.

THE FLIGHT OF MARIE ANTOINETTE. *By G. Lenotre.* Pp. 340. Philadelphia: J. B. Lippincott & Co. $3.50.

NAPOLEON, KING OF ELBA. *By Paul Gruyer.* Pp. 293. Philadelphia: J. B. Lippincott & Co. $3.50.

M. Gruyer has written for us a volume on Napoleon at Elba which he prefaces by a charming description of the island. With that earthly instinct which characterized the migratory Freeman, our author has gone carefully over the scene of his story and with skill and insight has described it all in such a vivid fashion as to make the very footprints of the imperial prisoner seem real to us. The story is a complete one—it begins with the arrival of the great guest, narrates his daily doings, interests and plans, so far as they have been rescued from the maw of oblivion, and closes with the departure for the last scene in the great Napoleonic drama. There is nothing maudlin about the volume (its author surely was among the millions who recently voted Pasteur the greatest Frenchman) and it deserves to be bought and read by every Napoleonic student.

THE LOW CORNEL (*Cornus canadensis.*)
From Sedgwick's "The Garden Month by Month." Stokes.

The Garden Month by Month. By Mabel Cabot Sedgwick, assisted by Robert Cameron, gardener of the Harvard Botanical Garden. 8vo., pp. xvii, 516. New York: Frederick A. Stokes Co. $4.00.

An entirely new plan is employed in this very valuable book for all who love to cultivate flowers. There is in it no nonsense of fine writing and poetical quotations. On each page there are six vertical columns under the month in which the flower blossoms. The first column gives the color, the next the English name, the next the botanical name, the next the description and method of culture, propagation and origin, and then the hight and situation in the garden, and finally, the duration of the blooming. These are illustrated by over 200 full-page and half-page half-tone engravings from photographs of growing plants, and the color is indicated by the tints on a colored chart of sixty-three numbers. We have only praise for this useful and attractive volume.

The Election of Senators. By George H. Haynes, Ph.D. New York: Henry Holt & Co. $1.50.

Gradually the principle by which the American people delegated the power of election of officers is fading from use and even popular respect. The Electoral College has long since ceased to choose our Presidents and Vice-Presidents, and as far back as 1850 there were signs of revolt against the legislative election of

Senators. Pennsylvania alone, in the Convention of 1787, under the leadership of James Wilson, voted for direct election. Now, however, in fifteen States the popular choice is indicated by popular vote and the choice is ratified by the Legislature; and probably a majority of States, and certainly a majority of the people, are ready for a constitutional amendment providing for direct election. Professor Haynes has, in the book at hand, very thoroly presented the whole matter from the historical standpoint and by the arguments both for and against change and also by an inquiry into the character of recent Senates and its causes. His own conclusion is strongly for popular election, and, assuming the passage of the proposed constitutional amendment, the nation will rejoice if his judgment is verified that the Senate can be mended when the people "in self-reliant, manly fashion," take the election of Senators into their own hands.

Reminiscences of Bishops and Archbishops. By Henry Codman Potter. New York: G. P. Putnam's Sons. $2.00.

Bishop Potter's recollections of the older bishops in the house during his secretaryship and of a few of his own contemporaries in the bishop's office make a most pleasant volume. The book is precisely what its preface promises—such a gathering of characteristic anecdotes concerning the various men as might well be told at a dinner of common friends. Some of the most entertaining stories are of Bishop Eastburn, a picturesque and vigorous character, one with whom Bishop Potter, in his early days, came in intimate contact. Perhaps the most satisfactory sketch is that of Bishop Williams of Connecticut, in which are included the recollections of several of his students at Trinity and Berkeley. Altho the papers are intended to deal with the lighter side of the clergyman's life, they pass at times from the domain of amusement to that of inspiration, which is notably the case in the fine account of the missionary bishop of Nebraska, Dr. Clarkson, and in the story of Bishop Wilmer's address to the Roman congregation which he found in a state of dissension during his visit to a church of his own diocese near by. Slight tho they are, the recollections of the archbishops, Tait, Benson and Temple, and of the Lambeth Conferences are well worth preserving. The whole collection has so finely human a quality that it should have interest to those in no way connected with either of the offices that make so impressive an appearance in the title.

The Vagabond in Literature. By Arthur Rickett. New York: E. P. Dutton & Co. $1.50.

Like the spherical water drop, which has its little kick against its neighbor in the sea and is glad to escape into the free air and recover its rotundity, Mr. Rickett's *Vagabond* may be defined as the social unit who takes to the free fields in order to get his kick delivered from neighborly obstruction. Of the gentlemen who have been able in some degree to indulge in this sometimes delightful practice of calcitration, our author considers at some length seven—William Hazlitt, Stevenson, Richard Jefferies, De Quincey, George Borrow, and our own Thoreau and Whitman. The general reader in America will perhaps be most interested in the last two. Thoreau, says Mr. Rickett, "finds his joy in living in the woods. . . . His interest in men and women was an abstract kind of interest." In fact, he "turned his back on civilization." Whitman, on the other hand, found his joy in the "Open Road." With his face toward the town, he may be said to have backed out of civilization, as far, at least, as Camden in New Jersey, where he continued to practice his "rude, melodic chants," and not without much grace, charm and a kind of earth-born vigor stimulating to the jaded sense. After much just and spicy discrimination, reserving for Whitman his undoubted fine qualities as a poet, and sternly condemning him for equally undoubted defects, the critic, as the rather lame conclusion of the whole matter, finds in the "good, gray poet" the true democratic bard—the "first genuine Poet of the People." "No writer of our age has better claims to be considered the Poet of Democracy." One may venture to question this conclusion—at least so far as our American life—the people on the farm, in the workshop, in the fac-

tory, even in the slums, represents democracy. One may venture to say that neither Mr. Whitman's "unmoral" versification of the "nudities" nor his barbaric versification of democratic ideals represents at all the average nature and wish and action—the dumb hope of the vast people. Neither the man with the hoe nor the people's man in the palace—and there are many of these last—has yet manifested a willingness to follow the banner of the *sans culottes.* These men know what the passions of men are—that they are natural enough; but they have not expressed yet any desire to see them publicly exploited. Wherever it has got an undirected hand on the ballot, this "huge, clamorous populace," which, according to Mr. Rickett, needs a "yet fuller note," a "more penetrating insight, a more forceful utterance," has selected a different sort of exponent for its ideals. In all its town governments, for instance, where is expressed the freest, cleanest, sanest voice of the people, horse-play of the sort so enthusiastically sung by the "good, gray poet" has been uniformly "put in the pound." The democratic ideals are manhood opportunity upward—free play of the virtues, not of the nudities. The "huge, clamorous populace" has everywhere set the stamp of its approval on the "betterments" of civilization, including the washed garments, and not on the unprofitable orgies of the *sans culottes.* It is more happily voiced in the life and speech of a Lincoln than in the deafening clamor of a cult. Its "growing pains" are better understood by a Lowell, a Whittier, than a Whitman.

The Papal Commission and the Pentateuch. By the Rev. Charles A. Briggs and Baron Friedrich von Hügel. 12mo, pp. iv, 64. New York: Longmans, Green & Co.

This thin volume is weighty in substance. For one thing, it disposes of any notion that Professor Briggs is likely to go over to the Catholic Church. The occasion is the childish decision of the Pontifical Biblical Commission concerning the Mosaic authorship of the Pentateuch. Professor Briggs writes to his friend, the Catholic scholar Von Hügel, his surprise and grief that the Commission should have put such a burden on the Church, and restates the critical conclusions as to the composite authorship of the Pentateuch, as against the Commission's conclusion that Moses wrote it, with the use of pre-existing documents and some later scribal additions. Von Hügel replies, defining the liberty of Catholic scholarship in the Church, agreeing with Professor Briggs as to the folly of the Commission's action, even altho approved by the Pope, and both agree that the decision should not forbid critical research and freedom. We observe some interesting statements by Professor Briggs as to what Leo said in an interview with him as to the question whether infallibility applies to such documents as Pius IX's "Syllabus of Errors."

A Critical and Exegetical Commentary on the Book of Psalms. By Charles Augustus Briggs, D. D., D. Litt., and Emilie Grace Briggs, B. D. Vol. II., pp. 572. New York: Charles Scribner's Sons. $3.00.

The first volume of this commentary we noticed after its appearance some months ago. It belongs to the International Critical Commentary Series, and so must not be expected to be popular or homiletic. It is printed for scholarly use, in the most compact way, with all possible contractions, so as to economize space, and yet it can be used by a student unfamiliar with Hebrew. The first volume contained the critical introductions and the commentary on fifty of the Psalms. This second volume includes simply the last one hundred Psalms. Under each Psalm there is first a synopsis of the contents, then an original translation from the Hebrew of a revised text, arranged in lines and divided into strophes. Then follows an introduction to the Psalm, covering date, author, history discussed linguistically. Then comes the larger commentary, by strophe, verse and single word; and finally a close grammatical and critical study of the Hebrew text, explaining changes from the Masoretic text. It is sufficient to say that the two volumes represent an enormous amount of the most careful critical study. Nothing like it has previously appeared in English, and it is quite up to the

highest German standard. Of course Professor Briggs is a higher critic and has no reverence for old tradition. Thus the Fifty-first Psalm is not an expression of David's penitence for his sin, but belongs to the time of Nehemiah, as indicated by the words, "Build thou the walls of Jerusalem." No other writer has paid more attention to poetic structure, and he has used its laws in his correction of the text. We recall that in Professor Haupt's Polychrome edition of the Hebrew books, Professor Wellhausen dodged this matter entirely by taking the Book of Psalms as a completed Psalm-book of the Second Temple, and so did not break it up into colors or do much in the way of critical emendation.

Literary Notes

....The theology taught for many years by Professor Milton Valentine in the Seminary of the General Synod of the Lutheran Church at Gettysburg, Pa., is published under the title *Christian Theology*, by the Lutheran Publication Society of Philadelphia. (2 vols., $5.00.)

....The latest addition to the "Crown Theological Library" is a translation of Professor Rudolf Otto's *Naturalistische und Religiöse Weltansicht* under the title *Naturalism and Religion*. ($1.50.) The work is an enthusiastic and able defense of the religious view of the world and is significant of a renewed interest in metaphysics on the part of liberal German theologians. Other issues of this valuable series of the Messrs. Putnam are Professor Heermann's "Communion with God," and "Faith and Morals," Bousset's "Jesus," Delitzsch's "Babel and Bible" and von Soden's "History of the Early Christian Literature."

....The Troutsdale Press, of Boston, Mass., is issuing an excellent series of *Monographs on American Book Plate Designers*, illustrating the works of F. Arthur Jacobson, Edward Edwards, Herbert Gregson, Amy M. Sacker, Elisha Brown Bird, Ralph Fletcher Seymour, D. McNeely Stauffer, Adrian J. Iorio, Frank Chouteau Brown, Hugh and Margaret Eaton, Louis J. Rhead, Theodore Brown Hapgood and Margarite Scribner Frost. The introductions and letterpress for the volumes already published have been written by W. Porter Truesdale, W. G. Bowdoin, F. C. Brown and O. P. Hatton. These monographs are characterized by a typography at once carefully studied and very dainty. Charles E. Goodspeed, of Boston, Mass., is the selling agent.

....The *Annual Report of the Smithsonian Institution* for 1905, now published, contains, as usual, a number of scientific articles and addresses, but these are neither so numerous nor so well selected as formerly. The present volume devotes only 475 pages to this feature, while that of 1904 had 682 and that of 1903 had 759. As this appendix, giving a readable survey of recent advances in the various branches of science is the only part of the volume that is of interest and value to the general public, or—it might almost be said—to anybody else, we are sorry to see it diminishing. Possibly the new secretary will find it possible to revive in an improved form the former custom of presenting a comprehensive survey of the scientific progress of the year. This would contribute more than any other one thing to "the diffusion of knowledge among men."

Pebbles

SPRING.

How sweet it is in joyous spring
To see the lambkin gamboling!
But sweeter far to have supplied
The same, with mint sauce on the side.
—*The Gourmet.*

"BOOKING" THE SENATOR.

SENATOR W. A. CLARK detests nothing more than to be interrupted when busy. One day he was in his office engaged in a business conversation when a *petite* woman, carrying a black bag, entered. With a compelling smile and an insinuating manner she approached the surly millionaire. Utterly insensible to his repellent mood and indifferent to his abrupt manner, she drew from the depths of a bag a handsomely bound volume, the merits and beauty of which she began eloquently to descant upon.

Failing to embarrass her with Arctic frigidity and impatient at her persistency under rebuffs all but vulgar, he turned suddenly upon the chattering woman and asked:

"Madame, do you know what my time is worth?"

She confessed it was a conundrum.

"Well," he said, petulantly, "it's worth thirty dollars an hour!"

He turned away with the air of one who had settled the matter definitely beyond any further controversy. But he didn't know the woman.

"Oh, I'm so grateful to you, Mr. Clark," she replied, with a tone of pathos in her voice. "Thirty dollars an hour, did you say?"

"Yes, that's what I said; and it's cheap at that," and he smiled cynically.

"Oh, I know it's dirt cheap," she chirped with winsome blitheness. "I'm so glad you told me"—rummaging in her reticule, from which she quickly flashed out a purse gorged with currency. Moving near to the astonished millionaire, who now regarded her movements with unfeigned curiosity, she counted two bills, a ten and a five, off the roll. These she pushed along the top of the sloping desk toward him and said: "Yes, I'm glad you told me, because I hadn't expected to get it so cheap. There is fifteen dollars. Now, I want a half hour of your uninterrupted attention while I talk to you about this book."

Clark pushed the money back and subscribed and paid for two copies of the book.—*Pittsburg Dispatch.*

Editorials

The Peace Congress

THE National Arbitration and Peace Congress, which closed its four days' session in this city last week, was, to our recollection, the most distinguished unofficial gathering ever held in this country. In point of numbers it was as impressive as a great national political convention; but in the personnel of its officers, speakers and delegates it was a much more eminent body. When two defeated candidates for the Presidency of the United States, eight Cabinet officers, ten United States Senators, nineteen Congressmen, four Supreme Court Judges, twelve State Chief Justices, nine State Governors, sixty New York editors, twenty-seven multi-millionaire captains of industry, thirty labor leaders, ten mayors of cities, eighteen college presidents, forty bishops, leading rabbis and clergymen, twenty-six noted women, twenty State Superintendents of Public Schools, to say nothing of numerous lawyers, farmers, philanthropists, scientists, etc., join together in a congress to further a great cause, the success of such a congress is assured from the start.

We tell elsewhere as much of the doings of the congress as space permits. Of course, much was said that would not be especially new to the readers of THE INDEPENDENT, who have been kept well informed as to what has been thought about World Peace. The results of the Congress, however, as embodied in the resolutions, are weighty and progressive, and should they be seriously discussed by the second Hague Conference, that august assembly might be kept in session until next Christmas. It was this second Hague Conference, of course, to which the attention of all the speakers was mainly directed, for it was generally recognized that this Congress was called together chiefly to crystallize the peace sentiment of the United States and give our delegation at the second Hague Conference the support of the American people.

Before the first Hague Conference met in 1899, the chief topic of discussion was disarmament, just as we are now discussing disarmament before the second coming conference; yet it was generally recognized by the speakers at the Congress that to expect disarmament before the world is politically organized, is to put the cart before the horse. Of course this does not mean that the discussion of disarmament will not do a great deal of good, and, therefore, we are glad to see that Secretary Root says that the United States will support England in her disarmament proposition. But as THE INDEPENDENT has repeatedly said, the next step in world organization is to make the second Hague Conference provide that all future conferences shall assemble automatically and periodically, and not at the call of some monarch or sovereign; for in automatic and periodic conferences lie the germ of an international parliament. As The Hague Court, which we already have, is the yet imperfect Supreme Court of the world, so an automatic and periodic conference would be the imperfect parliament of men. Time would surely extend the scope and usefulness of both court and parliament. This Peace Congress, therefore, in turning the eyes of the Administration at Washington and our delegates to the next Hague Conference to this paramount issue of world organization, has performed a labor that alone justifies its existence.

The honor of suggesting the Congress is due to Mr. Mead and Dr. Trueblood, of Boston, gentlemen who have long been identified with the American peace movement. Nevertheless, as the idea of the Congress took shape, is was carried out by the representative men rather than by the professional peace workers, so that when the conference finally assembled both the practical and idealistic people were working in accord for its success. The practical man learned of the great work that has already been done by the prophets, philosophers and peace workers, and the peace advocates in turn were made to realize that progress must be slow and compromises must be made in order to achieve success. The newspaper press of America with few excep-

tions treated the Congress as its importance warranted, and even the polite incredulities of the foreign papers took up many columns. To Mr. Carnegie the chief credit for the success of the Congress belongs, both as the guiding hand and the presiding genius. There is no question that he is a most canny speaker. When Baron d'Estournelles, the most eminent European advocate of peace, presented Mr. Carnegie with the Cross of the Legion of Honor at the Hotel Astor, the 600 diners arose to their feet with a common impulse and paid their tribute to the worth and work of "the Little Father of Peace." That was a fitting culmination to Mr. Carnegie's work for internationalism. Mr. Bryan also took a leading part in this Congress. He, at least, of the leading American statesmen, realizes that the peace movement has now past from the idealistic state into that of practical politics. Public recognition should also be given to Professor Dutton, Robert E. Ely, Hayne Davis, and half a dozen members of the executive committee for the untiring and at times almost overwhelming work that they did to make the Congress a success. The only regret of the whole affair is that President Roosevelt failed to seize a great opportunity. If he had come to the Congress and put himself at the head of this noble movement for the substitution of law for war, its effect upon the world would have been electrical. That he does not see that there is no greater opportunity for his statesmanship than this, only shows that he is not yet aware of the historical aspects of the peace movement or mastered its philosophy.

Emanuel Kant, in his great essay on "Eternal Peace," said that peace could not come to the world until the world was politically organized, and it would not be safe to organize the world politically until the majority of the nations had a representative form of government. They have it now; and a man like President Roosevelt, with the power and prestige of the United States behind him, and with no entangling foreign alliances, could probably do at this present moment on an international scale and without a war what George Washington did only after a war for thirteen separate colonies. Is all this impracticable? The man who thinks so has failed to grasp the trend of the times.

Righteousness and Peace

WHAT President Roosevelt wrote to the Peace Congress was this:

"Tho it is our bounden duty to work for peace, yet it is even more our duty to work for righteousness and justice. It is 'righteousness that exalteth a nation,' and tho normally peace is the handmaid of righteousness, yet if they are ever at odds it is righteousness whose cause we must espouse."

The President quotes Bible, but the Bible also tells us that "righteousness and peace have kist each other"; and that seems to have been Mr. Carnegie's notion:

"We have heard righteousness contrasted with peace. Why, I tell you that righteousness and peace cannot be divorced. Imagine the state of mind of that man who insists that they can be divorced. What could be greater righteousness than peace on earth, good will toward men?"

Both Scriptures and both men are right, altho in international questions it is more important, usually, to dwell on pliant peace than on rigid righteousness. Yet this is to be considered, that righteousness is a virtue which a single person can attain, while peace requires two parties. A man may be righteous whatever any one else may say or do, but in order for him to have peace some one else must consent to it. As it takes two to make a fight, so it takes two to make peace. That man is thrice armed who has his quarrel just; and who would not fight if he were not allowed to live in peace? We take it that Mr. Carnegie, lover of peace as he is, would fight in a defensive war, just as, years ago, he fought against a strike. We presume he has sympathy with some rebellions against oppression and injustice.

But it is not important to argue the righteousness of defensive wars. Nobody will question it, except Tolstoy. What we want to teach and press is the wickedness of wars that are not defensive, wars in which both parties believe they are right. These are the cases for arbitration, for Mr. Carnegie well says:

"The man who assumes that he is right and insists on judging his own course has not the

proper sense either of justice or of righteousness. It is the man who offers to submit his cause to a righteous judge that embraces the 'righteousness that exalteth a nation.'"

A further question of "righteousness" is involved in an important suggestion in Secretary Root's address at the Peace Congress. Speaking of The Hague Court he said:

"What we need for the further development of arbitration is the substitution of judicial action for diplomatic action, the substitution of judicial sense of responsibility for diplomatic sense of responsibility. We need for arbitrators, not distinguished public men concerned in all the international questions of the day, but judges who will be interested only in the question appearing upon the record before them. Plainly, this end is to be attained by the establishment of a court of permanent judges, who will have no other occupation and no other interest but the exercise of the judicial faculty under the sanction of that high sense of responsibility, which has made the courts of justice in the civilized nations of the world the exponents of all that is best and noblest in modern civilization."

This is a very important matter which has, perhaps, not received sufficient attention. There is reason to believe that in certain cases of arbitration the arbitrators have balanced political interests instead of solely considering the justice of the case. It would be very wrong in settling a disputed question of territorial rights, for example, to try to placate both claimants by a compromise instead of giving square justice. It is a judicial court, not a congress of diplomats. We thank Mr. Root for this warning, and we believe it will be heeded.

In his very weighty address Mr. Root reminds us that the end of war is to come thru the education of the people into the love of both righteousness and peace. That education comes thru such meetings as this in Carnegie Hall, and the Mohonk Conferences and the interparliamentary meetings, but still more by the sessions of The Hague Conference. May we add that the journals which guide public opinion have a great duty in this matter, and we may also suggest that the lighter literature of romance which paints the evils of war has done much to this end, and perhaps more in France than in this country.

To return to President Roosevelt's letter. What he said was true enough, but he missed a rare opportunity to lead the march forward, instead of contenting himself with adding superfluous fortifications along the old road.

Federal Offices in New York

Mr. Roosevelt desires most earnestly that the Republicans shall nominate and elect, to succeed himself, a man who will support his policies. The man he has in mind at present is Secretary Taft. The approval and assistance of a majority of the delegates to be elected to next year's national convention will be needed, of course, for the accomplishment of his purpose. Of the State delegations, New York's will be the largest and will have much weight, especially if the members of it stand together. When Governor Hughes took office at Albany, it became known that his policies with respect to State affairs resembled those of President Roosevelt concerning national questions. In seeking legislation to carry those policies into effect, the Governor's friends have encountered much opposition, mainly from an influential group of unworthy legislators, in which both parties are represented.

It became known on the 15th that the President was convinced that Governor Hughes ought to have the sympathetic support of the Republican "organization" in New York. That is true enough. Owing to the character of his purposes, he deserves to have the support and aid not only of what is called "the organization," but also of all good men in the State, be they Republicans or Democrats or members of any of the smaller parties. It appears that among the Republicans at Albany who are opposing the Governor in certain matters are some who are in sympathy with James W. Wadsworth, who incurred the President's disapproval and lost his seat in the House by reason of his attitude toward the Meat Inspection bill. It was commonly thought at the time that Mr. Wadsworth was unduly solicitous for the welfare of the Beef Trust. A. W. Sanders has been Collector of Internal Revenue for the western part of New York for about eight years. He was appointed upon the recommendation of Mr. Wadsworth.

On the 18th, his resignation was demanded. Some time earlier (it has been asserted without contradiction) his administration was approved and he was directed to renew his bond, with a view to his reappointment. His removal, therefore, caused some surprise. Mr. Wadsworth became angry and called the President hard names. It appears that several postmasters in the district represented by Mr. Wadsworth until March 4th were not reappointed at the recent expiration of their terms, although it is asserted (thus far without contradiction) that their service had been satisfactory and that the Post Office Department was preparing to recommend their reappointment.

To the agent of the Associated Press it was stated at the White House that the removal of Mr. Sanders was a part of the President's plan to strengthen the hands of Governor Hughes; that the refusal to reappoint the postmasters was in accord with the same plan, and that appointments would be made hereafter of persons who would support Governor Hughes's administration.

The reports of the Washington correspondents of prominent newspapers are to the same effect. Dispatches from Albany say that the Governor was not consulted concerning the removal of Sanders and that he knew nothing about the case. It is not asserted, so far as we can learn, that Sanders's service as Collector had not been good, that he had been guilty of pernicious activity in politics, or that he had exerted influence in the State Legislature to thwart the Governor's purposes. The evidence thus far available is to the effect that the President's aim is to assist the Governor by means of his power to remove and to appoint Federal officers.

We shall be glad to learn that there were other and better reasons for the removal of Sanders and the refusal to reappoint the six postmasters. If Sanders had performed his duties satisfactorily and had refrained from using the influence of his office for political purposes, he should have been retained. If the same was true of the postmasters, they should have been kept in the service. This would have been in obedience to the efficiency rules adopted by Postmaster General Cortelyou, who was at the head of the Post Office Department, it is stated, when these postmasters' terms expired.

We did not approve Congressman Wadsworth's attitude toward the Meat Inspection bill. Governor Hughes is a public officer of high character, whose reform projects are warmly to be commended. We trust that President Roosevelt's successor will be a man in sympathy with him as to those great questions of domestic policy with which his name is associated. But it is wrong to use Federal offices and Federal officers as agents for the accomplishment of political ends, or by means of their political influence to secure either the enactment or the defeat of measures in State Legislatures. It is a violation of the rules and spirit of the merit system, of which Mr. Roosevelt, while Civil Service Commissioner and at other times, has been a prominent advocate. Nor is it justifiable thus to use the Federal service for obtaining control of delegates to a national convention, even if the purpose of procuring such control be to insure the defeat of reactionaries or the nomination of the best possible candidate.

May Public Employees Strike?

It is hardly a century since a workingman's strike was, in English-speaking lands, a conspiracy which might be severely punished. The right to participate peacefully in a strike is now everywhere admitted in civilized lands, so far as concerns the labor force engaged under private employers, including corporations. There is as yet no clearly defined law or policy governing the rights and responsibilities of employees of the State when differences arise between them and their employer.

Mr. Cleveland, it will be remembered, took forcible measures to prevent any labor interference with the carrying of the United States mails. The Government of Holland two years ago acted promptly and relentlessly when a general strike of employees on the State railways was threatened in that country. Italy has had serious difficulties with railway and other public employees, but

has adjusted them by a policy combining concessions with firmness. In Russia the strike is at present a revolutionary measure, and anything that may happen there is hardly to be regarded as indicative of what may be done under normal conditions. France, acting thru Prime Minister Clemenceau, who is also Minister of the Interior, and M. Barthou, Minister of Public Works, takes the stand that disciplinary measures will be used against the leaders of employees in their departments who signed an open letter in favor of their right to strike.

The question whether this apparent tendency of governments to deny the right of public employees to strike is on all accounts right and wise, is not entirely simple or easy to answer. Certain extreme cases, to be sure, are fairly clear. Where class government exists, and the masses of the people have no participation in it, the right of public servants to strike is a part of the general moral right of the people to attempt to bring about more democratic conditions. It has, of course, no legal quality. Under universal suffrage there should be theoretically no resort to any other means than the ballot to effect changes of either constitutional polity or administrative policy. Our socialistic friends assume that in the socialistic state everything would go smoothly and everybody would work happily according to the mandate of the majority. This is a pretty large assumption, and we suspect that for the first two or three millenniums there would be occasional outbreaks of minority kicking here and there. But it is something to have an avowal that parties to a democratic covenant ought to abide by the democratic decision.

Applying this principle to the question whether in the United States public employees should enjoy, within the limits of law, a right to strike, we can offer apparently only a negative answer. If, for example, mail carriers or public school teachers organize trade unions, and then on occasion back up demands for shorter hours or longer pay, do they not obviously by so doing assert either that they do not consider themselves as members of the great corporate body, the State, which they serve, and that they will therefore deal with it as outsiders, or that, being members of it, they do not propose to abide by the majority decision?

There is a further reason also for denying the alleged right of public employees to strike. Under a systematized organization of the civil service, such as now everywhere prevails, civil servants are in some sense a privileged class. Admitted to their positions in the classified service on certain conditions, they have a certain tenure of office which gives them, in the eye of the law, that "right to the job" which wage-earners in general are prone to assert as a cardinal moral principle governing industrial relations. Is it not quite plain that such a right carries with it a correlated duty to serve and protect the public within reasonable limits, and that participation in a general abandonment of work or official duties, whereby entire departments of activity may be paralyzed, is in contravention of reasonable requirements of duty?

If, as a matter of principle, the right of public employees to strike shall be denied, the practical procedure of prevention need not be especially difficult. The obvious preventive measure is the forfeiture of all pass and promotion grades in the classified service for participation in any strike movement.

It would introduce quite new ideas of military and naval discipline if strikes were to become legitimate in the army and navy.

Commemoration of John Calvin

In 1903, the three hundred and fiftieth anniversary of the burning of Servetus in Geneva, there was erected in the Swiss city an expiatory monument to his memory, and it is proposed in 1909, the fourth centennial of the birth of Calvin, to dedicate a monument to the memory of the man who was responsible for the heretic's martyrdom. It is a striking example of the wide tolerance of our times that the memorial to Servetus was erected chiefly by men of closer religious sympathy with his persecutor, while the movement in behalf of a suitable commemoration of the work and influence of

Calvin would appear to be supported largely by those who are not regarded as partisans of Genevan theology. A meeting to enlist American co-operation in the endeavor was held in this city last week at the Union Theological Seminary, and its presiding officer was Professor George William Knox, the Seminary's acting president. Those who called the conference made it clear that they were thinking of Calvin's work "from the broad point of view of history," and that the movement was to be "not primarily theological or local, but comprehensive and national." President Eliot, of Harvard, was one of the principal speakers, and he endorsed the effort heartily, tho reserving to himself the right to make his own contribution in gratitude for the "by-products of Calvinism, democracy and political liberty," rather than for its distinctively religious teaching. Mr. Edwin D. Mead, of Boston, whose zeal for radical views in religion is well known, appeared to be even more positive and enthusiastic in behalf of honor to Calvin than President Patton, of Princeton. Felix Adler, of the Society for Ethical Culture, was mentioned as a warm admirer of Calvin's Institutes, and his letter endorsing the work the conference had in hand left no doubt as to his conviction that the Genevan reformer holds high place among those to whom the present generation should be grateful.

The city of Geneva has secured already something like $25,000 for a Calvin monument, and preparations for an impressive celebration in 1909 are well under way. Auxiliary committees are at work in England and Scotland, also in France and Germany, and the American committee, appointed at this conference, should have little difficulty in securing the modest sum of $25,000 which is suggested as America's share in this endeavor. No country is more deeply indebted to John Calvin than our own. His religious teaching lies at the foundation of all that is best in American theology. Jonathan Edwards, Hopkins, Taylor, Finney and Bushnell had been impossible without the solid structure erected in Calvin's Institutes. In no small degree the thought of the Genevan teacher is responsible for the strong, vital religious faith which has characteried the best American life. The very principles of our free democracy were worked out first in the noble "school of Christ" of which Calvin was the distinguished founder and leader. Our system of education, and particularly our colleges, trace their impetus back to the work of Calvin in "receiving the young men of Europe as wood and sending them forth as arrows."

It is a signal for encouragement that justice can be done to the great French theologian, despite the horror of the fagots about Servetus. In that crime he was the child of his age: in many other respects he was the prophet of our modern day. It is typical of the age also that a conference representing such widely separated tendencies in religious thought and practice could be summoned to prepare honor for Calvin's memory, and that their deliberations could harmoniously and enthusiastically recommend to the beneficence of America active participation in the endeavor to erect a tribute of gratitude to one of the great founders of modern liberty.

The Sources of the Nile

The Duke of the Abruzzi has solved the last secret of the geographical riddle of the centuries by ascending all the peaks of the Ruwenzori range. These were duly located by Ptolemy as the Mountains of the Moon between the lakes that fed the Nile, but they were removed from the map by more modern geographers skeptical of Alexandrian science, and not until the latter part of the nineteenth century were they restored to their place of honor. Sir Henry Stanley, in 1889, climbed one of the northwestern spurs to the hight of 10,677 feet, and gave to the mountains the name of Ruwenzgori, which means "Rainmaker."

It is no wonder that their existence was doubted for they are rarely seen even by those who live in their vicinity, because their snowy summits are perpetually wrapped in clouds and invisible for months at a time. The natives never ascend above six or seven thousand feet and could not be induced by the exploring party to go much higher. The dry

season of the early summer was chosen for the enterprise, but even then the chief difficulty of the Abruzzi expedition was to find their way thru the fog from one peak to another and to make the necessary photographs and triangulations. The Duke took with him some of the scientists and Alpine guides who had taken part in his previous mountain climbing; his attempted ascent of Kangchenjunga, the second highest mountain in the world, and his successful ascent of Mount St. Elias in Alaska. The party was well equipped with scientific apparatus and camp conveniences, and provisioned for forty days in the hights; all of the impedimenta being packed in fifty pound cases which the native porters could carry on their heads. Each case of provisions contained food for twelve persons for one day, soldered in tin with a light wood covering. The entire expedition, as it approached the slopes of the mountain, consisted of ten Europeans and about 400 natives.

The European party landed at Mombasa in British East Africa, and there took train to Port Florence or Kisumu on Victoria Nyanza, now only a two days' trip. Crossing the lake by steamer they reached Port Alice or Entebbe, the capital of the Uganda Protectorate. From this point to Fort Portal, the westernmost British military station of Uganda, is a distance of 180 miles, which was covered in fifteen days. The Duke decided not to enter the mountains thru the great natural gateway formed by the Portal Peaks, but, instead, went up the Mobuku River, a more gradual approach, leading to the foot of the highest peaks. These are the twin crests of the mountain which has now been given the name of Mount Stanley. On June 16th, 1906, the Duke of the Abruzzi with three Alpine guides made the ascent. His account as given in his address before the Royal Geographical Society of London and printed in the *Journal* of the Society for February, is worth quoting literally:

"At dawn the heavens gave no fair promise, but we started, nevertheless, Retigax leading, Ollier next, I third, and Brocherel bringing up the rear. In an hour, over easy slopes, we gained a level glacier broken by but few crevasses. The twin peaks, separated by their characteristic saddle, faced us close at hand. It was 6:30 a. m. The sun shone for a moment, and then hid himself in the clouds that rose from the east. Soon we began to feel puffs of wind from the southeast, which rapidly increased in force, and half way across the plateau the mist enveloped us. Retigax marched on, and led us to the ridge which fell from the southern and lower of the two highest peaks. The snow was in good condition and after cutting a few steps we gained the top at 7:30 a. m. In the dense mist we could not even see the higher peak, which was only a few hundred yards off. The excellent condition of the snow made the descent to the saddle shorter than we had anticipated. We climbed up by a very steep snow slope to the cornice. We had to evade the icicles and ice columns that hung from and supported it in order to find a means of gaining the ridge. The slope was so steep that my head almost touched the feet of the guide in front of me. In cutting steps Retigax sent down a shower of ice on his followers, and I looked forward with pleasure to the moment when our party would resume its normal relations—one in front and not one above the other. We found at last a sort of ice chimney 6 feet high. Retigax, to climb up it, had to plant his nailed boots on the head and shoulders of the unfortunate Ollier, who served him as a mounting block. The ridge was ours, and at the same time the top.

"It was 11:30 a. m. A fresh breeze blew from the southeast; the clouds swept past but a few yards under us, leaving clear only the two peaks, that we had left and that on which we were standing. And to these summits, the only ones in view at this moment which crowned my efforts, I gave the names of Margherita and Alexandra, in order that, under the auspices of the two royal ladies, the memory of two nations may be handed down to posterity; of Italy, the name of which resounded for the first time on these snows in our shout of victory; and of England, which in its marvelous colonial expansion carries civilization even to the slopes of these remote mountains. Having unfolded the little flag which had been given to me at Rome by Her Majesty Queen Margherita before my departure, I fastened it to a staff planted on the highest point of the snowy dome, to the triple cry of 'Viva Margherita! Viva Alexandra! and Viva l'Italia!' The winds blew out the tricolor above the snows, which up to that time had known nothing but the breath of the tempest, and the little letters of the motto which the august lady had embroidered on the flag—'Dare and hope'—were displayed to our view."

The English cannot take unalloyed satisfaction in the results of the expedition, because it appears that the mountain that bears the name of England's Queen is in Kongo territory. The hight of Margherita Peak was determined as 16,810 feet, and Alexandra Peak as 16,744. They are therefore higher than any of the mountains within the limits of the States of our Union, altho exceed-

ed by Canadian and Alaskan mountains. In Africa they are surpassed by the volcanoes of Kenia (17,200 feet) and Kilimanjaro (19,720 feet). The Duke ascertained that the Ruwenzori Range consisted of six mountains connected by saddles of 13,800 feet to 14,400 feet high. These he named Mount Stanley, Mount Speke (16,080 feet), Mount Baker (15,988 feet), Mount Emin (15,807 feet), Mount Gessi (15,647 feet) and Mount Thomson (15,273 feet). These names have been approved by the leading authorities on the region, and will doubtless remain except the last, which the president of the Royal Society took the liberty of changing to Mount Luigi di Savoia in honor of the Duke of the Abruzzi, who first ascended and mapped the range.

Formerly when royal scions were temporarily thrown out of their hereditary employment the only thing they could do without loss of dignity was to take part in some war. But the Duke of the Abruzzi has found a new and more glorious way of proving his personal prowess and enterprise. Deprived of his prospects of a throne by the abdication of his father, King Amadeus of Spain, he has devoted himself to filling up the few blank spaces yet remaining on the map, and, altho only thirty-four years old, he has gone from one end of the earth to the other in search of adventure and in the interests of science. He traveled across polar snows farther than Nansen's "farthest north," and now he has explored African glaciers under the equator.

The Conference of British Premiers

WHILE we are waiting for the Federation of the World, which may be nearer than we think, we may pause to consider and rejoice in the conference in London of the Premiers of the British Colonies. It is no small part of the world which they represent; for they represent all the self-governing portions of the British Empire. That includes half the northern continent of America and Newfoundland. It includes the southern quarter of Africa; and it includes the whole of the Continent of Australia with New Zealand added. These are really three great nations; and they meet in the capital of the most powerful nation of Europe, at the invitation of its Government, and in consultation with it. That nation, which is really, if not nominally, a part of the conference, and a dominating part, rules also Egypt in Africa and other considerable possessions; the mighty Empire of India and Burmah in Asia, and in addition the coast of Arabia, and, virtually, nearly all the rest of Asia south of the Himalayas; and it has great possessions in Central and South America and in the islands of the various oceans. Besides all these, Great Britain has close treaty relations with two of the mightiest nations in the world, France and Japan, and the closest sympathetic interests with the United States. When we add these nations and their territories together they include nearly all of North America, nearly all of Africa, the southern and best third of Asia, all of Australia, and a multitude of other islands and scattered possessions. This is not the whole world, but it is a very large part of it.

And all this is in either confessed or substantial federation. And yet this is not all the Federation of the World thus far achieved. Leaving out Canada as thus in the British federation, practically all the rest of the two continents of North and South America are in an American federation, which has its recognized organization and meets regularly for sessions, and has its fixt Bureau of American Republics in Washington. Together and in harmony these two federations could easily control the world, as in fact they do. Germany, now really the only other first-class Power not included, complains that it is now isolated and has no effective allies, for the Dreibund exists only in name.

Is it too much to anticipate that these two great federations should combine? Here are the United States, the dominant factor in one of them, and Canada, no small factor in the other, in the closest relation with each other. The United States and Canada are each a bond between the two. Stranger things have happened than that the United States should be a member in the same

federation with Great Britain, Canada, South Africa and Australia, for already Canada and Australia are to all intents and purposes as independent and self-governing as the United States, and South Africa will be as soon as it can formulate such a union as Canada and Australia have achieved. The English-speaking world, at least, might well begin this World Federation.

The movement toward political union has of these late years been astonishingly rapid. Think of the steps that have been taken. Think of the separate colonies of British America united under one Parliament. Think of the separate Australian colonies cemented into one great Australia. Think of the separate colonies of South Africa already planning a great Africander union. Think of all these again uniting in this Intercolonial Conference, which is to meet at regular periods, and then think of the Conference, almost a Congress or Parliament, of American Republics, uttering their common voice. And then, once more, think of the Court of The Hague constructed, and the anticipation of that further development of it into a veritable and effective Union of the Nations, when wars and vicious rivalries shall cease, and Peace shall rule the earth. Is it too much to look for all this in a few years?

About Immaturity—a Spring Idyl

We write the praise of immaturity. No color is so beautiful as green—the color of growth. It comes in between blue and yellow. Blue is the color of the dawn; yellow of sunset; green is the happy mean between the two. There is nothing more delicious than green corn, green peas, green beans and green lettuce. A cabbage head is never anything else but green, and as such it has its table value. As for green apples, that is another thing; it depends upon the stomach. A boy will go farther and thru more trials to secure a pocketful than he will for a bushel of ripe Harvest Boughs. As this is not explainable by reason it can be set down to instinct. Boys are so made, and that ends the story. The Indian so thoroly appreciated this period of unripeness that he glorified it with his chief holiday, the Green Corn Dance.

Growth, after all, is the real and only purpose of Nature; it covers everything and goes thru all the seasons. When growth is checked and the corn is ripe, the stalk immediately dies and begins to pass over into other forms of growth. It is a mistake to suppose that Nature is struggling simply to ripen the seed; she is simply determined that evolution shall never cease. We feel with Nature; therefore we sing the corn when it is green and when the plant waves its triumphant life banner. We dance with the Oneida when the green corn flower is sweet and the life blood of the year is at full tide. We touch the pulse of Nature in May, and we feel the sympathy of every violet and of every lilac bush. We, too, are living! cry the joyous apple trees, as they open their blossoms and perfume the orchard. We, too, are full of life cry the rose bushes, as they burst out into crimson blossom.

What is the world filled up with? The more you think of it the more you will see that it is with unfinished things. Everything is growing, eating; eating to grow, to ripen, to get older and stronger, and then to grow some more. Some one has written a chapter on "Animals on the Road," by which he means to tell us that not only is the individual always unripe, but every race, every thought, every ideal; even the animals are unfinished creatures. It is the part of the skilful farmer to make better horses and better cows. Burbank tells us that weeds are only flowers and fruits on the road, and he proves it by giving us better plums and better apples. There is not anything in the world really finished; and as for heaven, nobody any longer holds it to be a mere china closet of finished folk. If this were not so, then the whole world would in time become a mere storage room, and we a lot of old furniture. Bring out an eighteenth century coach and try a race with the trolley. Here again growth is the law, while the trolley is still in its green youth.

Only give us a chance to prove that we are not finished—not yet done growing—that we need more time. Let us get it

demonstrated that a man at seventy is still in his greenness, and we have solved the problem of immortality; we shall get at least a second period of growth. And when that is rounded up, if we are still in the unfinished, what shall hinder a third, or even a fourth? Growing old is then simply growing. It consists in not stopping, in never thinking about a goal, or in ever getting there. Nothing could be more unwholesome than those hymns that describe final reward for a final wind-up. A real man—that is, an immortal person—never does get thru, never reaches a haven or heaven; never wishes to do it, and is always learning, always ready to learn, and always widening his powers.

Darwinism is gradually familiarizing us with vast visions, not only backward thru an eternal forwardness, but forward thru an unending evolution. It shows us man as an immature product of millions of years of growing. At every period he seems to be finished; he seems now to be in a finished state. Fortunately, we know that we are quite unfinished, and that the law of life is betterment. Man is as far from completeness as was the horse when he was a five-toed hipparion. Perhaps there is an increase in the rapidity of progressive changes, but the end is no more in sight than when one of the Adam family leaned on his hoe—rising to erectness. Not only is electricity affecting the survival of the fittest, but new spiritual forces have found their way into the world, to keep us under their subtle influence.

Socially it is the same story. Our institutions, that are worth anything, are always in a growing condition. What we have to look out for is the statesman who glorifies the past. The American Constitution is far beyond its original length, and still it is a green document. Washington's Farewell Address and the Monroe Doctrine, which closed the Continental door, have developed into the open-door principle of President McKinley. Hugo Grotius and King Henry of Portugal broached the doctrine of a World's Congress in an immature state; and the international relations which bind together the nations and pledge a reign of peace are still the child of evolution. The sublimest truth ever uttered was "Yet it moves." Progress is the glorious law of all times.

Besides some human folk we have never been able to find anything finished that has life in it; even the ants and the bees have been proved to be not wholly creatures of instinct. The doll is finished; it cannot digest its sawdust. That is about the shape of the problem, Are you still able to digest food and truth, or do you prefer the sawdust of an old worn-out theory that has come down to you thru the smoke of centuries? Can you stand a new, a green, notion, without losing your temper? Do the Darwins set your teeth on edge, and, instead of evolution, only check your development?

"It takes thirty years to make a decent farmer and forty to make a good one"; and another saw tells us that "At forty every man is a physician or a fool." Then let us make a new division of duties, and turn over the pulpit, the bar and the medicine chest to those after forty. Our notions about age have been too much Oslerized. We really only begin a certain degree of sureness at forty. Old age is a misnomer; it is only the tomorrow of boyhood. At seventy one may hardly be more positive than at thirty. Green may have partly turned to yellow, but death before one hundred is always premature.

We have done what we promised; we have sung the song of the immature. The song is not finished, and it never will be. Northern Spys have displaced thorn apples, but some day a still better apple will swing on the orchard boughs. We rejoice in the man who is yet to come; and when he comes he will know no truth greater than that he is on the road of eternal progress. This is a song of spring, is it? We do not know, but this we do know, that the demand for rightness which is made of our youth is unwise, as it is impossible. Hazing is supposed to have a good collegiate side to it, for it hurries up the dull ones, so that they may wear the cap and gown of "finished" scholarship. So our schools are spoken of as finishing off places. The boy is always a better boy for his immaturity. No true boy ever passes the adolescent mark very far without having

fought a windmill—and possibly been tossed in a blanket of despair. Immaturity is it, and yet in it is knighthood! One of the most profound remarks of Herbert Spencer was made to a young billiard player. He had run out his rivals with a rush, but Spencer said to him severely: "To play billiards in an ordinary manner is an agreeable adjunct to life; but to play as you have been playing is evidence of a misspent youth." What Spencer evidently meant was, that the young man had turned recreation into a finished achievement, leaving out the idea of improving himself, and giving pleasure to other people. Modern science and its philosophy lay their emphasis on evolution.

The Altruism of States

Santo Domingo has had the best year in its history. It is the year in which the United States has assumed control of the finances and has guaranteed peace. Previously the receipts of the Government had been about $2,000,000; last year they were $3,800,000. Of that sum the United States, which does the collecting, turns over 45 per cent. for expenses of the Government, and keeps the rest, which amounted January 1st to $2,317,607, to pay the debt. It is a good deed done for a neighbor by the United States, a bit of international altruism, altho we get a little advantage out of it by the peaceful conditions in an island with which we have little selfish interest. We shall probably carry on this business for ten years to come, perhaps perpetually. Now we are doing much the same for Cuba, and the business interests are greatly afraid that we shall leave the island to be the prey of fresh disturbances. Indeed, while our Government is quite ready to withdraw, we strongly suspect that so many and strong are the interests that wish us to remain and maintain order, that were we to withdraw they would again start a revolution just to bring us back again. It seems to be manifest destiny that the United States should control the West Indies. We cannot regret it. We believe it is best for those islands, while we are by no means so sure that it is best for us to take the burden. But we believe that altruism, another name for unselfishness, is binding just as much on states as on individuals. What a man should do for others, even at some loss or burden for himself, is no more than one nation should do for another nation. And, further, that godliness which we are told is profitable for individuals, is equally profitable in the long run for states.

Debts and Peace

National debts pile up in time of war, and ought to reduce in time of peace. It is most satisfactory that Mr. Asquith, Chancellor of the British Exchequer, is able to announce, in his Budget for the year, a reduction of the permanent debt to the amount of $68,570,000. This is large, but it is not 2 per cent. of the total national debt, which is nearly four billions of dollars. Of this debt the war in South Africa is responsible for $795,000,000, of which $100,865,000 has been paid. Only France has a larger national debt than Great Britain, and her debt is nearly six billion dollars. That of Russia nearly approaches that of Great Britain, while that of the United States is over nine hundred millions, created by our wars, of course, and is being reduced in time of peace sometimes fifty millions a year. France has to pay nearly a hundred million dollars a year in interest, which is a terrible burden on its industrious inhabitants; and Russia will have to defalcate on the interest on her debt if she cannot, like the get-rich-quick concerns, borrow more money to pay more interest with. But France and the Jews are now refusing to lend her any more money. Bloated national debts thus become hostages of peace.

The Worst Spellings

Many of the friends of simplified spelling ask why the Board is satisfied with recommending so few words, whose simplified spelling you have a difficulty to find on a page of THE INDEPENDENT; and they ask for something more which will embrace the "worst spellings" in the language. The Board, at its late annual meeting, asked that such a list be made out. Have those who wish it considered what these "worst words" are? They are such as the following, *debt, doubt,* omit *b; indict, victuals,* spell *indite, vittles; island, aisle,* omit the *s; receipt,*

omit *p*. The words with *gh* are very bad, and fall in many classes. In such words as *aught, caught, daughter,* the *gh* could be left out to advantage, but the omission in *bought, brought, thought,* would still leave the spelling bad enough. If we omit the two intrusive letters in *eight, weight, freight,* we shall leave the words exactly phonetic, is in *vein, veil;* but *rough* and *tough,* and *cough* and *trough* cannot be amended by omission; they must be respelt. Probably the most annoying of all ill-spelt words are those that confuse us between *ei* and *ie,* such as *believe, siege,* and *deceive, receive;* omit the *i* in all of them. Then there are the words in which there are two sibilant letters for one sound, such as *scissors, scythe, scimetar, scent, scepter, science,* in which the extra *c* means nothing but nuisance, and, in the two last, a distant reminder to Grecians. The Grecians should also allow us to omit the silent *p* in such words as *pneumatic, psychology;* but when we come to *oblique* and *opaque,* the only remedy is to substitute *k* for *qu*. We do not expect these changes to be adopted immediately, but it is to be wished they might be.

Nullification in Florida

The Senate of the State of Florida has by the vote of 23 to 5, imagining itself to be the Supreme Court of the United States, declared the Fourteenth and Fifteenth Amendments of the Constitution to be void, and has then past a bill to disfranchise the negro in that State. There is a certain beautiful originality in that action which we should not have anticipated, because we have not sojourned in Bedlam, and are not accustomed to track March hares. The resolution was introduced by one John G. Beard, of Pensacola, and we are told that the crowded gallery cheered the action of the Senate. We shall not be surprised if the Lower House shall agree with the Senate, for there is a contagion in mobs, with what the French call the *folie de foule,* and there is no quarantine to prevent the craze from passing to the other end of the Capitol. There is a bit of amusement in seeing the tail end of the country lashing itself against the body of the nation. We can hardly conceive the Supreme Court of the United States seriously taking into consideration the question of the validity of Amendments which have been accepted and adjudicated upon for forty years. There are other ways to get rid of negro suffrage, ways that have proved quite successful, which do not so squarely nullify the Federal Constitution. We shall look with interest to see if this madness will spread to other legislatures. What says Georgia, under its new Governor Hoke Smith?

Speak for Yourself, Priscilla

There used to be a game, popular among children, called "dumb orator," in which one boy made the gestures while another did the talking. This amusing spectacle was seen again on the platform of the National Peace Congress when the Daughters of the American Revolution gave a white-bordered peace flag to Mr. Carnegie. The Daughter who was chosen to make the presentation stood upon the platform, gracefully bowing, smiling, curtsying and waving her arms at the proper points while Mr. Hobson, late of the "Merrimac," who has a large round voice, made the presentation speech. No reason for this peculiar arrangement is apparent. It could not have been from any doubt as to the oratorical ability of women, for only the day before Miss Addams had, upon that same platform, given what many said was the best address of the session, both in thought and manner, and that, too, without raising her voice at any point to an unladylike pitch. Surely the Daughters would not have made such a blunder as to select for this mission a lady who could not address an audience. Besides, there was, unfortunately, no rule of the Congress requiring the speakers to make themselves heard in the top gallery. Several of the distinguished guests were "dumb orators" beyond the tenth row of seats, but at least they made their own gestures.

Equal Pay for Equal Work

The women teachers of New York City are making a plucky fight against unjust discrimination against them in salaries on account of their sex. It is

unfortunate that the metropolis cannot manage its own school business without interference from Albany, but the women have the sympathy of all lovers of fair play in their contest. To raise the old question of whether men or women make the better teachers in this connection is merely a political trick. Some women in some subjects and some grades are better teachers than some men and *vice versa,* and that is the only general rule one can truthfully make on the subject. In States where women vote they do not have to besiege the Legislature for their rights. For example, in Wyoming, which is "the Equality State" in more senses than one, the following clause is in the constitution:

"Art. VII, Sec. 10:
"In none of the public schools so established and maintained shall distinction or discrimination be made on account of sex, race or color."

Those in charge of the Jamestown Exposition have quite as much to do as they have time for. The grounds are in wretched condition, and it does not seem that Norfolk can show the "hustle" which transformed the St. Louis grounds in forty-eight hours. There is no effective arrangement of the buildings, the waterfront being the specialty, from which the buildings straggle back to the *one* trolley line which brings visitors and which has daily breakdowns. This sleepy country is not yet awake to the exposition's needs, but is alert for opportunities for exorbitant charges. The show of ships of war is ready, for the Government does its part in time, and there will be the biggest display of naval force ever seen in American waters.

That Cardinal Merry del Val is likely to be asked to resign his post as Papal Secretary of State is thus far only a plausible conjecture. Beyond all question his policy as chief adviser to the Pope has been most disastrous. It has been simply the repetition of *"Non possum,"* and that not in the most gracious language. We do not wonder that the old diplomats of the Vatican criticize sharply the young Spanish cardinal who has failed so completely in his dealings with France. The Vatican needs to show that better sense which the Scriptures assign to the wise men of Issachar who "had understanding of the times to know what Israel ought to do."

We welcome the Rev. C. F. Aked, D.D., to the New York pulpit. Presbyterians, Congregationalists and Episcopalians have hitherto been enriched by the coming of British preachers, and we are sure that the Fifth Avenue Baptist Church has added worthily to the succession. Dr. Aked is a man of both force and simplicity, and takes a progressive view as to theology and social movements. He has visited America before, and, we remember, has not hesitated to meddle with American concerns by hot words against lynching. His outlook will reach beyond the Baptist denomination.

Our American States which allow women to vote seldom elect them to the Legislature. But in Finland, which is a Russian State, the women have all suffrage rights, and as many as nineteen are elected out of two hundred members of the Parliament. That is because women have been so active and serviceable in maintaining the liberties of Finland. Thus Finland leads Europe, and what may we not expect when Russian freedom is achieved? We notice with particular pleasure that so many of the women elected are teachers.

One of the new words which we suppose we must have, and which is used in the Census publications, is *intercensal.* By all rules it should follow the Latin and be *intercensual,* but the word *sensual* would make suggestive confusion, and so we must submit to the solecism and let Washington have its way.

Mr. Bryan has come out for the Initiative and Referendum, and says that those who oppose it can do so only on the ground that American democracy is a failure. Mr. Bryan is right. The Initiative and Referendum is a great coming movement.

Insurance

The Mutual Life Ballots Counted

THE official count of the Mutual Life ballots, which began on December 18th, was finished last week, and the inspectors reported a sweeping administration victory. The greatest number of votes cast for any single candidate was 189,132 for Cyrus Curtis, publisher of *The Ladies' Home Journal,* of Philadelphia. William H. Lambert, of the same city, came next with 188,954 votes, and Charles S. Brown, of this city, was third with 188,949. George P. Miller, of Milwaukee; Hugo Baring, George C. Rand, Louis Stern, Henry Phipps, President Charles A. Peabody, H. Rieman Duval, Thomas M. Mulry and Emory McClintock, of New York, and LeRoy Springs, of Lancaster, S. C.; Sir Hiram Maxim, of London, and Emile O. Phillippi, of Paris, all received more than 188,000 votes.

President Peabody's place was eleventh in the list. All of the other twenty-one administration candidates, with the exception of Hamilton McK. Twombly, got about 185,000 votes each. Mr. Twombly's total vote was only 142,308, but this was due to the fact that Mr. Twombly had made it known after he had been nominated that he would not serve if elected.

The inspectors, who received $35 per day, cost the policy-holders about $18,000. Estimates made in insurance circles rated the cost to policy-holders of canvassing the votes at between $50,000 and $75,000. The International policy-holders' representatives have declared that the entire election, counting the time of the agents employed in the campaign, has cost the Mutual Life policy-holders not far from $1,000,000. Samuel Untermyer proposes to ask the Legislature to order a new election, with new restrictions as to ballots, non-participation of agents, etc. Mr. Peabody will be continued in his present office as president.

Taxation and Life Insurance

MODERN luxury and the growing demands of the States for revenue for their general purposes has led to the imposition of taxes or penalties upon the economy, the prudence and sacrifices of citizens to protect their families and estates located within the borders of the taxing States. Toll is now unblushingly levied upon a man's contributions to the losses of his corporate associates in the matter of life insurance. Taxation shows an ever-increasing tendency to place a premium upon improvidence, and the spendthrift goes free while his prudent and saving brother is made to pay taxes on the results of his thrift. John M. Taylor, president of the Connecticut Mutual Life Insurance Company, of Hartford, Conn., in his report to the members of his company, has touched upon the matter of taxation in connection with life insurance, and has strikingly set forth therein the fact that taxes were not taken into account as a part of the expenses in the primary assumptions of the life companies. No provision was made for them because none could be made, as they were wholly unforeseen. This era when taxes were a negligible quantity has long since passed, and because of the very much changed governmental attitude forty-one companies reporting to New York in 1905 returned to their policy-holders in dividends $35,741,701.09, and during the same year these companies paid into the treasuries of the governments and States in which they did business, in taxes, the sum of $9,212,334.39—equal to 25.77 per cent. of the entire dividends returned. If these taxes had not been laid the cost of insurance to the prudent policy-holders would have been just so much lessened. It is such things that ought to inspire careful thought on the part of those in whose hands the ultimate remedy lies.

EX-UNITED STATES SENATOR JOHN F. DRYDEN, president of the Prudential Insurance Company of Newark, N. J., who retired from his canvass for re-election because of illness, has now recovered his health. He returned to Newark last week from Atlantic City and was "at home" at the Prudential office. He will henceforth devote himself to his insurance interests. In an interview Mr. Dryden stated that the company had always tried to do more than the law required and that this policy would be continued with respect to new and pending legislation.

Financial

Ex-Comptroller Eckels

JAMES H. ECKELS, Comptroller of the Currency from 1893 to 1897, and for the last nine years president of the Commercial National Bank, of Chicago, died suddenly in that city on the 14th, of heart disease. The end came while he was asleep in his bed. He had been dead for several hours when an attempt to awaken him was made in the morning. Mrs. Eckels had for some months been in Paris, where their only daughter was attending school. She was soon to return to her home.

Mr. Eckels died at the age of forty-eight, and he was only thirty-four years old when President Cleveland appointed him Comptroller of the Currency. He had won the friendship of Mr. Cleveland in Albany while a student in the Law School there. After graduation he practiced law in Ottawa, Ill. His nomination in 1893 surprised the financial world and was unexpected by Mr. Eckels himself. Confirmation of it was vigorously opposed at first by prominent Democrats as well as by Republicans, all of whom admitted in later years that Mr. Eckels's excellent service in the office amply justified Mr. Cleveland's good opinion of him. It is said that Mr. Eckels had never read the National Bank Act and had never had a bank account of his own. Immediately after he became Comptroller he was confronted by the panic of 1893. In the thirty years preceding only 212 national banks had failed; in the first ten weeks of his term 165 failed, and it was necessary to appoint receivers. It was a trying time for the young lawyer, but he acquitted himself well. Making some changes in the traditional policy of the office, he encouraged the broken banks to resume business. More than 100 of them did so, and nearly all of these remained sound thereafter. Mr. Eckels proved to be a Comptroller of marked ability. In later years he was a very successful banker, and at the time of his death he was interested in several prominent banking and manufacturing corporations. He was a forcible and instructive speaker and writer upon financial topics, and from the beginning was an earnest advocate of the gold standard. Ex-President Cleveland was deeply moved by the news that he was no longer living. "I was closely related to Mr. Eckels," said he, "and his death comes to me with a peculiar shock. In important public work I learned how intelligently and industriously he devoted himself to duty, and in the intimacy of close friendship I learned to know and appreciate his rare and attractive qualities of heart. In every relation of life, as a citizen, as a business man, and as a friend, he was earnest and whole-hearted. He illustrated the traits that make the best American citizenship."

....J. Pierpont Morgan was seventy years old on the 17th inst. He is in Italy, where, on that date, he received many cabled messages of congratulation. To one of these, sent by his partners and employees, more than 100 signatures were attached. It is reported that hereafter, content with the many notable achievements of his long and distinguished financial career, Mr. Morgan will lay aside many of the cares which attend active participation in business.

....The Beaver National Bank is the name of a new bank just started in this city. The authorized capital is $200,000. George M. Coffin, once Deputy Comptroller of the Currency and recently vice-president of the Phoenix National Bank of this city is the president; S. H. Vandergrift and J. P. Welsh are vice-presidents, and J. V. Loughlin is assistant cashier. The directors are the president and vice-presidents and Frank Bornn, of Bornn & Company, importers and exporters; John B. Fassett, president of the Citizens' National Bank, Tunkhannock, Pa.; Thomas A. H. Hay, president of the Northampton Traction Company, Easton, Pa.; Martin W. Littleton, ex-President of the Borough of Brooklyn; George Mercer, Jr., of George Mercer & Son; Thomas E. Murphy, of Philadelphia, vice-president of the Citizens' National Bank, Johnstown, Pa.; Augustus K. Sloan, of Sloan & Company, jewelers, and Earl Vogel, of Gorham & Vogel, attorneys.

The Independent

VOL. LXII NEW YORK, THURSDAY, MAY 2, 1907 No. 3048

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Roosevelt at Jamestown

The Jamestown Tercentennial Exposition was opened formally on the 26th ult., in the presence of about 100,000 visitors. On land much remained to be done, for almost all of the buildings were unfinished, but at sea the exhibition lacked nothing except the presence of a few foreign ships whose arrival had been delayed. In the fleet of thirty-eight ships of the United States, the growth of our navy was represented by various types, from the old cheese-box monitor, "Canonicus," to the "Connecticut" and other 16,000-ton battleships of the latest model. Among the twelve foreign ships (others are soon to arrive) were cruisers from the British, German, Austrian and Argentine navies. Early in the morning the "Mayflower," bearing President Roosevelt, joined the fleet and was greeted by the customary salute of twenty-one guns from the assembled ships and the adjacent fort. Members of the Diplomatic Corps, Cabinet Ministers and others came down from Washington on a large steamship. After the President had received the foreign naval commanders and reviewed the fleet, the opening exercises on land took place, beginning with prayer by Bishop Randolph. Harry St. George Tucker, president of the exposition, in his address of welcome, spoke first of the causes which led to the settlement of Jamestown. Then, after pointing to the evidence of the power and prosperity of the descendants of the early settlers, he said to Mr. Roosevelt:

"But, Mr. President, these are but as sounding brass or as tinkling cymbal unless the spiritual, the idealistic, the patriotic sentiments of our people are simulated and cherished. It has been your proud privilege to do much to turn the public mind toward high ideals, and we humbly trust that it may yet be your privilege to do much more for the cause of civil liberty. You have boldly challenged to battle those who, in your judgment, would curtail the ancient principle; the final outcome cannot be in doubt; an iron nerve, a dauntless courage—with which you are happily possessed—will be your support throughout the conflict."

In the early part of President Roosevelt's long address the most notable passage, perhaps, was that in which he heartily welcomed "the representative of the mighty island empire of Japan; that empire which, in learning from the West, has shown it had so much, so very much, to teach the West in return." He expressed an earnest wish for the welfare of all the nations represented:

"The world has moved so far that it is no longer necessary to believe that one nation can rise only by thrusting another down. All far-sighted statesmen, all true patriots, now earnestly wish that the leading nations of mankind, as in their several ways they struggle constantly toward a higher civilization, a higher humanity, may advance hand in hand, united only in a generous rivalry to see which can best do its allotted work in the world. I believe that there is a rising tide in human thought which tends for righteous international peace; a tide which it behooves us to guide through rational channels to sane conclusions; and all of us here present can well afford to take to heart St. Paul's counsel: 'If it be possible, as much as lieth in you, live peaceably with all men.'"

The greater part of his address was historical. Toward the end of it he spoke of the "dangers that spring from popular self-government tried on a scale incomparably vaster than ever before in the history of mankind, and from an abounding material prosperity greater also than

anything which the world has hitherto seen":

"In industrial matters our enormous prosperity has brought with it certain grave evils. It is our duty to try to cut out these evils without at the same time destroying our well-being itself. This is an era of combination alike in the world of capital and in the world of labor. Each kind of combination can do good, and yet each, however powerful, must be opposed when it does ill. At the moment the greatest problem before us is how to exercise such control over the business use of vast wealth, individual, but especially corporate, as will insure its not being used against the interest of the public, while yet permitting such ample legitimate profits as will encourage individual initiative. It is our business to put a stop to abuses and to prevent their recurrence, without showing a spirit of mere vindictiveness for what has been done in the past."

Burke, in his efforts for economic reform, had combined unshakable resolution in pressing the reform with a profound temperateness of spirit, which made him, while bent on the extirpation of the evil system, refuse to cherish an unreasoning and vindictive ill will toward the men who had benefited by it:

"This is the exact spirit in which this country should move to the reform of abuses of corporate wealth. The wrongdoer, the man who swindles and cheats, whether on a big scale or a little one, shall receive at our hands mercy as scant as if he committed crimes of violence or brutality. We are unalterably determined to prevent wrongdoing in the future; we have no intention of trying to wreak such an indiscriminate vengeance for wrongs done in the past as would confound the innocent with the guilty. Our purpose is to build up rather than to tear down. We show ourselves the truest friends of property when we make it evident that we will not tolerate the abuses of property. We are steadily bent on preserving the institution of private property; we combat every tendency toward reducing the people to economic servitude; and we care not whether the tendency is due to a sinister agitation directed against all property, or whether it is due to the actions of those members of the predatory classes whose anti-social power is immeasurably increased because of the very fact that they possess wealth."

Other republics had fallen because the interests of a class had been considered before the interests of the whole. "We are resolute in our purpose not to fall into such a pit. This great republic of ours shall never become the government of a plutocracy, and it shall never become the government of a mob."——When Mr. Roosevelt touched the electric button very little machinery was set in motion, but a thousand flags were unfurled.

"Undesirable Citizens"

To the criticisms by labor organizations of his reference (in his letter of October 8th, 1906) to Moyer and Haywood as "undesirable citizens," President Roosevelt has made reply, in a letter addressed on the 22d ult. to Honore Jaxon, of Chicago, chairman of the Cook County Moyer-Haywood Conference, who, in behalf of that association, had sent to the President a protest, asserting that the latter's words in the letter of October 8th were "designed to influence the course of justice" in the approaching trial of Moyer and Haywood for murder. The President says:

"I entirely agree with you that it is improper to endeavor to influence the course of justice, whether by threats or in any similar manner. For this reason I have regretted most deeply the action of such organizations as your own in undertaking to accomplish this very result in the very case of which you speak. For instance, your letter is headed, 'Cook County Moyer-Haywood-Pettibone Conference,' with the headlines, 'Death cannot, will not and shall not claim our brothers.' This shows that you and your associates are not demanding a fair trial, or working for a fair trial, but are announcing in advance that the verdict shall only be one way, and that you will not tolerate any other verdict. Such action is flagrant in its impropriety, and I join heartily in condemning it."

It is absurd, he continues, to suppose that because any man is on trial for a given offense he is therefore to be freed from all criticisms upon his general conduct and manner of life. He had spoken of Mr. Harriman, on the one hand, and of Messrs. Debs, Moyer and Haywood, on the other, as being equally undesirable citizens. This was not designed to influence either the trial of Moyer and Haywood or the suits against Harriman. He had neither expressed nor indicated any opinion as to whether Moyer and Haywood were guilty of the murder of Governor Steunenberg:

"But no possible outcome either of the trial or the suits can affect my judgment as to the undesirability of the type of citizenship of those whom I mentioned. Messrs. Moyer, Haywood and Debs stand as representatives of those men who have done as much to discredit the labor movement as the worst speculative financiers or most unscrupulous employers of labor and debauchers of Legislatures have done to discredit honest capitalists and fair-dealing business men. They stand as the representatives of those men who, by their public utterances and manifestoes, by the utterances of the papers they control or inspire, and by the

words and deeds of those associated with or subordinated to them, habitually appear as guilty of incitement to or apology for bloodshed and violence. If this does not constitute undesirable citizenship, then there can never be any undesirable citizens. The men whom I denounce represent the men who have abandoned the legitimate movement for the uplifting of labor, with which I have the most hearty sympathy; they have adopted practices which cut them off from those who lead this legitimate movement. In every way I shall support the law-abiding and upright representatives of labor, and in no way can I better support them than by drawing the sharpest possible line between them on the one hand and, on the other hand, those preachers of violence who are themselves the worst foes of the honest laboring man."

The complainants, he adds, would be entirely within their right if they should merely express an opinion that Moyer and Haywood are "desirable citizens," altho in that case he should take frank issue with them "and should say that, wholly without regard to whether or not they are guilty of the crime for which they are now being tried, they represent as thoroughly undesirable a type of citizenship as can be found in this country," a type which existed among capitalists as well as among wage workers. He had been condemned by some capitalists, as well as by some labor men, for his reference to "undesirable citizens":

"I am as profoundly indifferent to the condemnation in one case as in the other. I challenge as a right the support of all good Americans, whether wage workers or capitalists, whatever their occupation or creed, or in whatever portion of the country they live, when I condemn both the types of bad citizenship which I have held up to reprobation. It seems to me a mark of utter insincerity to fail thus to condemn both, and to apologize for either robs the man thus apologizing of all right to condemn any wrongdoing in any man, rich or poor, in public or in private life. You say you ask for a 'square deal' for Messrs. Moyer and Haywood. So do I. When I say 'square deal' I mean a square deal to every one; it is equally a violation of the policy of the square deal for a capitalist to protest against denunciation of a capitalist who is guilty of wrongdoing and for a labor leader to protest against the denunciation of a labor leader who has been guilty of wrongdoing. I stand for equal justice for both, and so far as in my power lies I shall uphold justice whether the man accused of guilt has behind him the wealthiest corporations, the greatest aggregation of riches in the country, or whether he has behind him the most influential labor organization in the country."

——The letter has been greeted by a chorus of loud and bitter denunciation from labor organizations and leaders. There is a movement, originating in Milwaukee, for a general protest by parades and mass meetings on a day to be set apart for such a demonstration.

Land and Trust Cases

Senator Borah, of Idaho, who recently arrived in Washington, denies the published report that the purpose of his visit was to ask for delay with respect to an indictment said to have been found against him in Idaho. There has been, he says, no official announcement of such an indictment. District-Attorney Ruick, who was called to Washington, is said to have brought a statement of the evidence laid before the grand jury. It is explained that the Department of Justice sent for him in order that it might have information as to the condition of all the land cases in his district, where a change of judges was impending. The proceedings by which it is said that the Senator was affected excite interest because he has been employed as special counsel to prosecute Moyer, Haywood and Pettibone. There is evidence of bitter factional differences in the Republican party of the State, and it is asserted that Mr. Ruick is attached to the faction which is hostile to the Senator. Some say that the proceedings before the grand jury may indirectly affect the coming trial of Moyer, Haywood and Pettibone, because Senator Borah was general counsel for the accused Barber Lumber Company, and the late ex-Governor Steunenberg was the company's agent.—— Binger Hermann, recently a member of Congress from Oregon, and for several years Commissioner of the General Land Office, was acquitted, at Washington, last week, at the end of a long trial upon the charge that with evil purpose he had destroyed thirty-five letter books of the Office. The jury was out twenty-one hours. Mr. Hermann is soon to be tried in Oregon upon an indictment for conspiracy in connection with land frauds involving the Blue Mountain forest reserve.——The Government appears to have won an easy victory in its proceedings against the associations of wholesale and retail druggists which

have been grouped under the general title of the Drug Trust. It is announced that all but nine of the ninety-two defendants have decided not to oppose the Government's application for an injunction. They were accused of violating the Sherman Anti-Trust law.——As directed by a resolution of Congress, the Bureau of Corporations is engaged in a searching investigation as to what has been called the Lumber Trust. At present its agents are collecting evidence as to the large increase of prices in 1906 and during the last ten years.

Cuba

In an interview at Cincinnati, on the 27th ult., Secretary Taft said that owing to the satisfactory condition of Cuba, and to Governor Magoon's success in gaining the confidence of all parties, he thought that the United States could withdraw from the island not later than in September, 1908. ——For some weeks the 8,000 cigar-makers employed by the Trust have been on strike, and have been drawing funds for their support from the 5,000 employees of the independent manufacturers. These 5,000 were locked out on Monday last. In all, about 20,000 workmen are affected.——Governor Magoon recently invited the leading bankers to a conference, at which he suggested that they should put into circulation a part of the $14,000,000 which had accumulated in the treasury. They replied that they did not care to borrow the money, even upon easy terms, because they already had an ample supply. He has decided to use a part of the accumulated surplus in the construction of roads.

Peace in Central America

A treaty of peace was signed at Amapala, on the 23d ult., by representatives of Salvador and Nicaragua. It provides for a general Central American peace conference, to be held in the near future at some point in Nicaragua, and also for a commercial treaty to govern trade between the two contracting republics. In Honduras there will soon be a general election, at which a President and members of Congress will be chosen. The present provisional Government, set up there by Nicaragua, has appointed General Estrada, of Nicaragua, commander of the revolutionist forces, which are pursuing the remnant of President Manuel Bonilla's army. ——The two men from Guatemala who recently assassinated, in the city of Mexico, General Manuel Barillas, the exiled ex-President of their republic, have made to the Mexican authorities a full confession, asserting that they were sent from Guatemala, with orders to kill Barillas, by General José Lima, now the Guatemalan commander-in-chief and a prominent supporter of President Cabrera. They say that they were also hired and directed to kill General Toledo, but could not find him. The Mexican Government asks that General Lima be held for extradition.

Philippine Islands

The greater part of Iloilo, chief city of the island of Panay, was destroyed by fire on April 19th, and about 7,000 natives lost their dwellings. Owing to the efforts of the soldiers and the constabulary, the business part of the city was saved. Iloilo is an important port, from which large quantities of sugar and other products are shipped.——On the following day, the dwellings in the southeastern part of Manila were burned. An area of 100 acres was swept by the fire, and 4,000 Filipinos were made homeless. As on the preceding day in Iloilo, very high winds prevailed and the flames spread quickly.——The earthquake shocks on the 19th caused no loss of life and but very little loss of property.

French Labor Troubles

The most embarrassing thing that the French Government has now to handle is a complication of labor difficulties in many different forms. The general public is most concerned with the strike of the provision workers of Paris, who are attempting to starve the capital into compliance with their demands for increase of wages and better treatment. It began with a strike of the bakers on April 11th, which was intended to close all except the co-operative bakeries managed by the men themselves and the establishments of individual

bakers having no employees. The strike was not very successful, as only 600 out of some 2,500 establishments were closed. The Government made arrangements by which the military bakeries could be drawn upon if necessary. This was followed a week later by a strike of the waiters and some of the cooks in the cafés and restaurants. Sealed orders were sent out in the afternoon to be opened at 6 o'clock, so just before the rush of the dinner hour most of the restaurants found themselves without waiters. Some were obliged to close; in others the patrons waited upon themselves, with such assistance as the proprietors, maids and the messenger boys could give. The grievances of the *garcons de café* were that they had not been granted the weekly day of rest provided for by the new law; that they are refused the right to wear mustaches, and that they are robbed of their *pourboires* by the proprietors. The custom in the cafés is that all the tips received are turned into a box in the safe. Every fortnight or month the box is opened, and the value of all broken dishes and lost or injured table utensils is subtracted. Then the wages of some helpers and certain running expenses are taken out of the fund, and what is left is divided among the landlord, the *mâitre d'hotel* and the waiters themselves. Among the general expenses paid from the *pourboire* box are the letter paper, toothpicks, matches and billiard chalk used by the patrons of the café. After a few days the restaurant keepers agreed to relinquish their share of the tips, to give the waiters a day off each week, and to permit them to wear mustaches. But they still hold out against a recognition of the Waiters' Union, altho Premier Clemenceau advises them to recognize it and submit the questions to arbitration. A bill has been introduced into the Chamber of Deputies forbidding any employer to restrict the right of his employees to wear mustaches, which were in ancient Gaul the sign of the free man.——Premier Clemenceau has not been entirely successful in carrying out his policy of preventing the employees of the Government from affiliating with the labor unions. The Department Council of the Seine, to which was referred the case of M. Nègre, secretary of the School Teachers' Union, decided not to dismiss him, holding that there was no formal law against the affiliation of the Teachers' Union with the General Labor Federation, which M. Nègre, in an open letter to M. Clemenceau, had advocated. M. Nègre pleaded in self defense that in signing the letter he was merely acting in his official capacity as secretary in obedience to the commands of the Union. The same question has come up in regard to the unions of the postmen and telegraph operators, who claim the right to join with other labor organizations and strike with them. M. Clemenceau's position is that the civil servant is not an ordinary working man, but a privileged person. He has a fixed salary and a permanent position, independent of supply and demand. His children are given gratuitous college education. He is allowed special railroad rates and receives a pension from the State. Therefore, according to M. Clemenceau, he owes the community certain duties, among which is the renunciation of the right to abandon work by concerted action. The postal employees, who signed the open letter to the Premier threatening him in impertinent language with a general strike, have been dismissed from the service.——A new organization which is assuming considerable power in France is that of the independent workingmen called the "Yellows," to distinguish them from the "Reds," or the socialistic and revolutionary unions. At a recent congress of the Yellows at Paris, 852 agricultural and urban organizations were represented. The president, M. Bièvry, announced that the object of the association was to oppose all monopolies, state as well as private, and to free the workingmen from the double tyranny of the employer and the Union. He said that the Yellows stood for decentralization, individual rights, private property and free association.

The Struggle of the Duma

In spite of threats and rumors the Russian Duma still remains in session. Whether it is accomplishing anything worth while remains to be seen. The finance committee is continuing its examination of the budget or Government

appropriation bill, notwithstanding the refusal of Premier Stolypin to allow them to ask aid of outside experts in their consideration of the bill. Even Prince Lvoff, the head of the famine relief commission, was refused admittance to the Tauride Palace; tho after a long wait he was allowed to go to the Secretary's office in company with a police agent to listen to the conversation. The finance committee has already cut down the Government estimates by $11,500,000. The trepidation manifested by the bureaucracy over any critical examination of the finances of the Empire has increased the suspicion with which foreign investors regard Russian bookkeeping, and if the Duma is dismissed now it may be difficult in the future to raise loans. From official figures it appears that since August 1,080 men and women have been hanged or shot by these summary courts-martial. During the same period 1,242 officials and policemen have been assassinated. Probably as many more innocent bystanders have suffered.——The committee appointed by the Duma to investigate the torture of prisoners in the Baltic Provinces confirm the rumors of horrible brutality. Men, women and children suspected of disloyalty or rebellion or of knowledge of such were shot or put to death by torture. Many of the details cannot be printed. Bones were broken, finger nails and hair torn out and salt rubbed into the wounds produced by flogging.——The Czar has adopted a new policy, that of personal interviews with the members of the Duma. He had a half hour's conversation with President Golovin on the work of the Duma and also received groups of the peasant Deputies. A more exact classification of the Duma according to party can now be given than that of Mr. Aladin published in our last number. According to their own declarations the members are divided as follows, beginning on the Left: Social Democrats, 64; Revolutionary Socialists, 34; People's Party Socialists, 14; Workingmen's Party, 100; Mohammedans, 11; Cossacks, 17; Constitutional Democrats (Cadets), 91; Polish, 46; Independents, 51; Moderates and Octobrists, 32; Monarchists, 22.

Foreign Notes

King Leopold on his return to Brussels found it impossible to induce Count de Smet de Naeyer to retain his position as Premier. He then called upon M. de Troos, who was Minister of the Interior in the late Cabinet, to form a new Ministry, but M. de Troos has not been successful in finding men who would take office at this juncture. The Liberal Radicals and Socialists have adopted formal protests against the action of the King in withdrawing the Mining Bill after it had passed the Chamber in an amended form. They contend that the bill was then in the hands of the Senate and the King had no power over it until its passage by the Senate, when he could have vetoed it. ——The election in Spain resulted in an overwhelming victory for the Conservative party, which is now in power. Out of 404 seats in the Chamber of Deputies the Conservatives will have 256, Liberals 61, Democrats 8, Republicans 32, Catalanists 17, Carlists 16, and minor parties 8. The Cabinet has passed the naval estimates, which amount to $10,000,000. This is an increase of $3,000,000 over the last budget, and the increase is to be maintained for eight years.——The Imperial Conference of colonial Premiers now in session in London has approved of the plan, tabled last week, providing for a General Staff of the Empire, which is to study the question of the defense of the British possessions, to furnish military information to the several Governments and to advise them regarding the training and organization of troops in order to secure greater unity and efficiency. On the question of imperial naval defense the Premiers declared themselves in favor of the discontinuance of the colonial contributions, which have hitherto gone into the general naval expenditure, and the substitution of a system by which the colonies may man and keep a certain number of ships to be supplied by Great Britain and undertake to maintain stations for coaling, ammunition and food. General Botha wants the Transvaal Government to be permitted to raise and equip a force of 40,000 men to keep order among the natives.

The Hawaii of Today

BY SERENO E. BISHOP, D.D.

Senior Surviving Missionary of the American Board in Hawaii.

MORE than six years ago Hawaii entered the national system of the United States as a Territory. As such it has continued to fulfil its part in an orderly and efficient manner. This fact implies that it did not at that time need to be Americanized, having already taken on the qualities of Americanism. It had previously become American in its republican form of government and in its social as well as political institutions and the dominant form of sentiment pervading them. It was already well prepared as a community to take its place as one of the constituent portions of the great Union. What Hawaii now needs, therefore, is not to be Americanized. That has already been accomplished. She now needs to be strengthened, confirmed, permanently established and solidly rooted in that character against all interfering and conflicting tendencies.

SERENO E. BISHOP

That Hawaii is a community characteristically American is at once apparent to the traveler arriving at Honolulu from whatever direction he crosses the ocean. If from California, the visitor still finds himself in an American atmosphere and not in an alien one. The town is American in aspect, the customs and institutions are American. The leading and prominent elements in the community are markedly American, notwithstanding a numerical preponderance of brown Asiatics and Hawaiians, besides Portuguese. The current speech is English of the American accent. The newsboys cry American papers. The street cars are swift American trolleys. The vehicles are of American style. American stores and warehouses line the streets. The law, medical and other offices bear American names. Familiar American churches point upward their spires. The vegetation only is that of lands without frost — palms, bananas and flame-trees. And the easy-going Hawaiian rides the billow on his surfboard, or lithely capers in his questionable hula.

If the tourist has come from the Orient he finds an anticipation of the home land in this American Hawaii. He has struck America's great outpost in the Pacific! If he comes from the Australian colonies he finds himself not among Britishers, but among people of the somewhat strange American tone and fashion of life, as well as of Yankee accent of speech, people who say "lay-dy" and not "ly-dy," "today" and not "to-die." Honolulu is a very markedly American town. Somehow the process of Americanizing has been most efficient and successful. Its color and hue have

TEACHERS AND PUPILS IN ONE OF

sunk deep into the life of the community with clear and permanent tone.

The American character of Hawaii is obvious to notice in the type of men who conduct its affairs, who are mainly Americans. Such are nearly all the professional men. The lawyers are almost exclusively Americans. Such are all the judges of the various courts, except in rural district courts, where native Hawaiians often preside. The medical men are usually American, altho a number of Japanese doctors minister to their own people. The great majority of school-teachers are Americans, altho many natives and part whites teach in lower grades of country schools. In like manner, aside from Asiatic trade, only white men, chiefly Americans, conduct mercantile and banking business, except that in the lower grades of trade Asiatics, Portuguese and part-Hawaiians are much employed. But all these use our English tongue as the organ of business.

The commercial life of Hawaii is mainly American, altho some leading British and German houses of long standing continue prominent. The sugar plantations provide the great backbone of our business; and these are predominantly in American hands. Subordinate labor on the plantations, however is mainly other than American, being largely Japanese, then Chinese, Portuguese and Hawaiian. The lower grades of mechanical labor thruout Hawaii have also largely fallen into the hands of the Japanese.

In nothing has the Americanizing of Hawaii become more complete than in our educational system. That system began to be organized by our missionaries at a very early period of their labors. The leading schools are almost entirely in American hands, with a few teachers of British origin. The sole medium of instruction is the English language, which the children of all races are required to learn. A number of Chinese and Japanese schools are maintained, which are taught at later hours than the Government schools. Our two advanced academies, the Honolulu High School and Oahu College, annually graduate many pupils of both sexes into American colleges. Besides these are a number of ably conducted boarding and industrial schools, for both sexes of native Hawaiians, which are on private foundations. All of these are under American teachers, with the exception of a few hundred girls under English sisters and French nuns.

Probably nothing is more completely significant of the high and clear American character of our community than

THE PUBLIC SCHOOLS OF HONOLULU.

the style and tone of our three English daily papers, the other daily being Japanese. Journalism necessarily conforms to the prevailing sentiment of the community. The papers have to talk as the people think and feel. If the ethical and social tone of the public is high and clean, then such is the tone of the papers. The tone of our three Honolulu dailies is as clean as in any town of Massachusetts or Iowa. It habitually expresses the ruling sentiment of a Puritan community. Read our papers, and you realize that we are effectually American, ethically, socially and politically.

It is by no accident that Hawaii has become thus wonderfully Americanized, and fitted for its place in the American Union, altho it is not a result of definite human design working for that specific end. It has rather been the result of a very marked Divine Providence, marshaling potent influences in succession. The process began with the wonderfully prosperous effort, commenced in 1820 by American missionaries, to Christianize the Hawaiian pagans. That work rapidly prevailed under the marvelous nourishing of the Divine Spirit, and in thirty years had transformed the ignorant barbarians into a Christian nation, with a liberal constitutional government, a well ordered judiciary and a strong educational system. The missionaries were Americans, and imparted an American tone to the new Hawaiian institutions. They naturally attracted to themselves other Americans of ability and similar character and sentiment. The sudden growth of an American State in the neighboring California then arose to confirm Hawaii's American tendencies. The American dominant community thus grew up, and has gradually shaped everything in commercial, political, social and religious life to the American type and tone. So now, after nearly ninety years of this progressive work, you find, flung far out here in the mid-Pacific, a strong American community dominant in Hawaii, and shaping everything here to its own form and likeness.

And yet it cannot be confidently asserted that this dominance of Americanism is wholly out of danger from internal tendencies. It rules supreme in all the upper strata of the social system. But it still lacks what is so very needful—a cooperative support from the majority of the laboring classes and from rural communities. Unfortunately, those classes and communities are largely Asiatic and alien to European and American origin. In the absence of any very recent census of the rapidly changing population of these Islands, I may give the following

as a rough estimate of the various nationalities composing it. There are:

Of English-speaking people, as follows:		
Anglo-Saxon	10,000	
Teutonic	2,500	= 22,500
Part Hawaiians	10,000	
Of races in general American sympathy:		
Pure Hawaiians	30,000	
Portuguese	25,000	= 55,000
Of Asiatics:		
Japanese	60,000	
Chinese	25,000	= 85,000
Total		162,500

It is thus apparent that over one-half of our population mainly of the laboring class, are Asiatic, and practically incapable of assimilating to American ideals, altho of great ability and practical capacity. Their sympathies and ideals are quite unlikely to become converted to an American type.

The Portuguese immigrants, altho illiterate, are a superior laboring class, of great intelligence and of Christian ethical ideals, especially as to sexual morals. They readily incline to Americanization, and will make valuable American citizens. They tend to rapid increase, both by immigration and by great natural fecundity. But there is needed a considerable rural population of genuine American character, to be in close contact with these Portuguese, in order to mold them into the right shape.

It becomes increasingly evident that, for the maintenance and progress of healthy Americanism, Hawaii requires a large influx of American farmers. We need the creation of a large number of rural American communities thruout our Islands. Of farming communities of such a character we have as yet only one of any size. Twenty miles north of our city, at Wahiawa, has grown up a fine little settlement of less than twenty American families, who are very profitably engaged in the culture and canning of pineapples. They are connected by railway with Pearl Harbor and Honolulu.

In the adjacent district of 50 square miles of moist, cool and fertile upland, lying at from 600 to 1,200 feet altitude, is room for 1,200 white families to engage prosperously in farming. That land is now unoccupied except for pasturage of cattle. It is too dry for sugar cane, which requires abundant moisture thruout the year. Pineapples would prosper on that land, and abundant winter and spring crops of produce would be profitably cultivated. Farmers in that district would enjoy an immediate prospect of a profitable sale of ordinary produce by cheap transportation to Honolulu, but more especially to the large town which is certain in a short time to grow up at Pearl Harbor, half way between them and Honolulu. I am figuring on the certainty of an enormous development of steam traffic consequent on the opening of the Panama Canal, as well as earlier from the Tehuantepec Railroad. This will speedily render Honolulu harbor inadequate for the increased shipping and compel a rapid growth at the neighboring port.

Other favorable localities for American farmers abound on this island and on Mano and Hawaii. I have no doubt that within ten years satisfactory locations could be secured for the occupancy of five thousand enterprising American families in cool and healthy upland districts. Many products have already been proved to be profitable for exportation. Besides pineapples and bananas, which are somewhat perishable, the canning of pineapples is profitably carried on; there is a successful production of sisal fiber of the highest grade, for binding twine; there is a very superior quality of coffee, and there is tobacco. Of common farm produce, it is enough to say that the larger part of our pigs and poultry are imported, as well as of our butter, altho these can be produced here nearly as cheaply as in California, were the skilled and industrious farmers here to do it. The citrus culture is wholly undeveloped in Hawaii, and there is a large import of oranges and lemons from California, altho oranges and limes are among the easiest of fruits to produce here. Hawaii ought to supply all the citrus fruits needed from Oregon to Alaska, and will ultimately do so. Our difficulty has been that "Sugar is King" and has usurped all our agricultural energies.

Here should be emphatically presented the fact that our Hawaiian climate is exceptionally adapted to the outdoor labor of white men. Altho within the tropics, Hawaii knows nothing of the continual

sweltering heats of the rest of the torrid zone. While we have no frost, our climate is much cooler than the summer climate of New England. In Honolulu, during summer, the mercury ranges between 70 degrees and 85 degrees, and in winter between 52 degrees and 75 degrees. Of the usual torrid heats of from 90 degrees to 100 degrees we know nothing, altho common in American harvest days.

The cause of our exceptional climate is our unvaryingly cold ocean, which, unlike all other tropical seas, steadily maintains a temperature at from 50 degrees in winter to 70 degrees in summer. This temperature is unvaryingly produced by a copious and uniform cold current from the California and Oregon coasts, where thruout all the summer afternoons the citizens of San Francisco have to wear overcoats to fend off the chill draft from the sea. Hawaii shares something from that Pacific Coast climate of America, and thereby is cooled unlike any other tropical latitude on this globe. It is this exceptionally dry and cool climate which favors our Americanization. From this cause our uplands possess the most delicious climate in the world. At altitudes of from 500 to 2,500 feet can be created the most charming homes, with nearly all the fruits and grains of the temperate zone.

There are on these islands as much undoubtedly as 500 square miles of desirable agricultural lands suited to the needs of enterprising American farmers, which are now unoccupied by any tillage, and are capable of handsomely supporting twenty civilized families to the square mile. Very little of this land, however, is at present open for purchase, being in good demand for sheep and cattle pasturage. The larger half of such lands are subject to private ownership, and much of the rest is held in long leases from the Government. As such leases fall in, it is understood to have become the policy of the Territorial Government to put homesteads upon the market at moderate prices to

HONOLULU HIGH SCHOOL.

desirable American settlers. It is also to be expected that some landowners will exercise a generous policy toward such settlers.

There are also in the hands of the large sugar estates many excellent tracts of the lower lands, which would, from fertility and climate, be very desirable for farmers. From these owners also a generous policy is desired and hoped for. There is thus much ground for anticipating a large addition to our American rural population during the next decade or two, such an addition as should establish our American character upon a solid basis.

Leading indications, however, of the near future point to a very different source of change in the status of Hawaii. The early future of these Islands seems likely to become overwhelmingly commercial rather than agricultural. Being the central cross roads of the North Pacific, all the great commercial routes of this ocean seem necessitated to converge here. Great steamer lines must very soon cross the Pacific from Panama to the Orient, carrying a traffic which will outdo that now crossing the Atlantic. Honolulu lies midway exactly in the path of that colossal traffic route which is nearly 10,000 miles from Panama to Hongkong. Many large freight steamers daily must call here to replenish their fuel supply. Both Pearl Harbor and Honolulu will become crowded with those freighters and fuel supply ships. They will in a few years become large commercial cities.

The immense commerce thus created here will call for food supplies from a teeming back country of busy and prosperous farmers. The agricultural resources, not only of Oahu, but of all the Islands, will be heavily drawn upon, and capable American farmers will flock here for profitable employment. One may well anticipate that not many years hence the twenty-five thousand acres of crowded cane fields along our Oahu shores will have disappeared and given place to produce farms. And the mighty pumps which drive two hundred million gallons of artesian water daily over the broad fields will nourish the tillage of a thousand produce farmers instead.

Hawaii may, therefore, well be regarded as now only in embryo. A populous, busy and wealthy State looms up in front of us as dwelling here in another generation. This new and giant future of Hawaii needs to be well provided for now, economically, socially and spiritually. America should at once diligently fortify Hawaii, not only strategically, but in all respects. Hawaii's early destiny is to be the great Headlight of Americanism and Christianity in the Mid-Pacific.

HONOLULU, HAWAIIAN ISLANDS.

Ver

BY CHARLES L. O'DONNELL

SANDALED with violets, adown the breaking way
She cometh, misty-eyed with hopes of May;
The changing splendor of the morning skies
Holds less of promise than her waiting eyes.

Across the black, ploughed fields her scarf of rain
In floating folds enwraps the leaping grain,
While 'neath the velvet press of her thin feet
Quickens to growth the blade of dormant wheat

And as she dreameth, down the blue, far rills
Rise windy banks of unborn daffodils.—
Soft! is it growing grass or young birds' call
Lisping to her, the Mother of them all?

BROOKLAND, D. C.

Americanizing Hawaii

BY HENRY B. RESTARICK, D.D.

Missionary Bishop of Honolulu.

THE United States has had, for nearly ninety years, men and women here who represented all that is best in American life. While there had been American traders coming and going for some years before, yet the Americanizing of Hawaii really began when the men and women sent out by the American Board landed in 1820. No one can understand, in even a faint way, the history of these islands who is not familiar with the story of these missionaries and their consecrated service for the people.

There were other influences here, but the chiefs and kings selected missionaries as their friends and advisers. The missionaries have been blamed for taking an interest and part in civil affairs, but the situation was peculiar, and the chiefs showed that they had at heart the good of their people when they selected missionaries instead of adventurers.

Under American influence the chiefs and kings gave privileges to the people which other nations had purchased by years of bloody strife. The Declaration of Rights in 1839, the proclaiming of a Constitution in 1840, the giving to the people in fee simple lands which they cultivated in 1848. These were accomplished under American influence, as was the drawing up of a code of laws by William Richards and the development of them by John Ricord, and the placing of the judiciary system on a good basis by W. L. Lee, who, on his way to Oregon in 1846, was induced to remain in Honolulu. In the forties and fifties a remarkable set of men came to Hawaii who sympathized with all that was done for the uplifting of the nation. The Scotchman, R. C. Wyllie, devoted his remarkable talents to procuring for the little kingdom just and fair treatment by the European Powers. Hawaii, thru the efforts of Mr. Richards and Sir George Simpson, of the Hudson Bay Company, had obtained a recognition of the independence of the kingdom by the United States in 1842, by England and France in 1843, but petty grievances still occurred.

Hawaii was most fortunate also in the men who went into business in the islands. They were not all Americans, but they were men who in a remarkable way were interested in the development of the islands and in the raising of the social life of the people, and so far in sympathy with the missionaries. In the period of the forties and sixties men came whose names stand at the head of large business houses, and they, with the missionaries' sons, who went into planting or merchandise, have for ability, foresight and integrity put the business of the islands upon a high level. Among those who came were Charles R. Bishop, American; Paul Isenberg, German; Theodore H. Davies, Englishman. Long ago, since 1826, the American house of Brewer & Co. and other firms had carried on trading business, but now came the opening days of the sugar industry and the coming in of the alien population.

There was strife in all these years as to whether British or American influence should prevail, but the Americanizing of Hawaii went on. Hawaiian born Americans kept up their patriotism, and the Fourth of July was, in the boyhood of men now old, kept as a holiday in the old-fashioned way, and Thanksgiving was celebrated with turkey and pumpkin pie.

In 1854, in order to protect himself against foreign aggression, the King Kamehameha sought annexation, and for a while it looked as if it were to be brought about. At the close of the Civil War the great Secretary Seward sent a secret agent here to make inquiries as to the purchase of the islands by the United States. This gentleman told me that so secret was the matter that in sending letters he directed them to his father, who forwarded them to Washington. He said that he believed that the purchase

could have been accomplished at this time, but that Seward had been so criticised for the acquisition of Alaska that he decided that the American people were not prepared for another addition of territory at that period, and so the matter dropped. Seward had a vision of the development of the Pacific, but he was ahead of his time. But at last the inevitable happened and Hawaii was annexed and became a Territory of the United States.

Now let us glance at the results of this Americanizing which has been going on so long. Until annexation, to be entitled to vote, a citizen must be able to read and write English or Hawaiian and have paid his taxes. There was a property qualification from 1864 to 1874. It has been said that the suffrage here should have been restricted by the Organic Act, and that it was a mistake not to have done so. In my opinion, it is no more of a mistake than elsewhere in the United States. I believe that the Hawaiians exercise their suffrage as intelligently and with a greater desire to do the right thing than is shown by the exercise of suffrage by mobs of newly naturalized citizens in the United States. It is true that race prejudice plays a large part, but so it does in other parts of the United States.

The Hawaiians have become thoroly American in their practice of politics, and the idea seems often to be that one chief function of government is to provide offices for as many as possible and provide work at good pay on roads and public works for voters. But, then, I have seen that idea prevalent on the mainland, and perhaps it is a part of the Americanism they have adopted.

It is true that many Hawaiian officials have proved defaulters; it has been in part the result of loose methods of the past, but even this feature with accompanying graft they may have learned from reading that such things exist or have existed in various parts of the United States. Speaking one day of the men who had brought Hawaii thru troublous times, men who had the genius of government and the ability to organize, men who were associated with Sanford B. Dole, who, however much the objects of party dislike, yet were known to be upright, strong and capable, the gentleman to whom I was speaking said: "They have no idea of Americanism. This country will be good for nothing until it is Americanized." I said: "In what way do you want it Americanized? If you mean by Americanizing that we should be better by getting under the control of corrupt political bosses, instead of under the influence of men who were born here and have built up the country; if you mean the inauguration of graft and the control by corrupting

BISHOP RESTARICK.

methods of great corporations; if you mean the importation here of methods which have prevailed in San Francisco ever since I have known it, then I would rather go on as we are, with men in politics who are not after place or graft."

No one can study the question without coming to the conclusion that the Americanism of the men who made these islands has been the Americanism of Washington, rather than that of Boss Buckley or the Philadelphia Ring.

The fact is, these islands have too much government. The last census gave

for the whole group 154,000 population. Of these 9,013 were white people other than Portuguese, of whom there were 15,675. There are Federal officials; then there is a full Territorial Government with its House of Representatives and Senate. Until two years ago the schools, public works, health, etc., were conducted by appointed boards. But it was considered American to divide the Islands into four counties—they wanted five at first. This made many new elective offices, and the places are nearly all filled with Hawaiians.

Mark Twain said of the Hawaiian monarchy that it reminded him of the machinery of the "Great Eastern" in a sardine box. In Americanizing Hawaii they have crowded more machinery into the sardine box. Under the conditions existing here I believe that a commission of three or five business men, as in Washington or Galveston, could manage all affairs and give a better and far cheaper government than this complicated system, with its many officials, now in vogue.

As one who has the privilege of being on terms of delightful friendship with the descendants of the missionaries I wish to say something, and any criticism which I make will be known to be friendly.

There is a feeling of despondency among many who have been or are engaged in Hawaiian religious work. They do not see the results for which they hoped. In that feeling I do not share. There are many disappointments, but when I consider that Christianity was brought here only a little over eighty years ago, I constantly marvel at what I see. It is true that "Kahunaism" is believed in, and that the moral ideas of many are not ours. But there is superstition in the States of the Union and there are classes whose moral ideas are low on the mainland.

The hope is with the generation now growing up, which has advantages which their parents had not, and in hundreds of homes you see the result. Speaking of those whom I know most intimately, because so many are under my care, the part-Hawaiian girls are particularly promising. As wives, mothers, teachers, etc., they become a credit to their training and race.

The expectation that Hawaiians should regulate their lives by Puritan standards was hard on a primitive people. The Roman Catholic Church, with long experience in dealing with such races, was more "human," if I may express my idea by that word. I mean, they had no commandments such as "Thou shalt not smoke," and made greater allowance in their discipline of their Hawaiian children. The missionaries had a great revival, but the Roman Church went on its way training the people, and made large gains.

When, in 1863, the American Board partially withdrew, and the churches were graduallv handed over to native pastors, the Roman Catholics, with their hard-working white men, their attractive service and their assertion of authority, had a great advantage, and the churches which had been under the American Board began to decline. This was accelerated by the overthrow of the monarchy, in which many sons of the missionaries were naturally implicated. The Congregational system was not favorable to the discipline of the native pastors, and the Island "Associations" have really exercised the powers of presbyteries. Still, it was hard at times to enforce discipline on a stubborn congregation.

Then the Mormons, who had been working here for some time, had white elders who lived with the Hawaiians. They were not hard upon "Kahunaism" and are supposed to have quietly favored a plurality of women for one man. Mormonism was more like the old religion of their fathers, as a Hawaiian said to me, and so the seed grew, not by appealing to the highest, but by pandering to weakness. It has drawn from the Protestants largely, but two Roman Catholic priests have told me that they believe that half of the Mormons in Hawaii had been Roman Catholics. Again, the Hawaiian Board finds it hard to get Hawaiian pastors. I must say that I do not wonder at that. On Kauai, for example, a sustentation fund assures the pastors $25 a month. This is not sufficient to support a man who is to be a leader of his people.

As a friend, I would say that it has seemed to me that my brethren have, in putting so much of their money into Chinese, Japanese and Portuguese work, left the original work somewhat a prey to other influences. This, however, the Hawaiian Board is seeking to remedy by renewing white supervision and other energetic means.

The Anglican communion came here in 1862, and, severely criticising the Protestant work, set forth a purpose to show those here just why there had been failures and how to deal in the right way with the natives. Its schools did good, but it never had a large work among the natives. For the forty years of its existence here, before the American Episcopal Church took its place in 1902, it was so engaged in unhappy disputes that aggressive effort was impossible. How far these various religious influences have aided in Americanizing Hawaii depends upon what one thinks. The Roman Catholic priests—devoted men—are all from the Continent of Europe. The Utah Mormons are not, I judge, enthusiastically American in the sense we use it. Yet for all this, the strong influence affecting all others has been that of the American and Hawaiian Boards.

But there are other people than the Hawaiians to consider. Many of the Scotch, English, Colonial and Germans here are not naturalized American citizens, nor do they intend to become such. This is unfortunate in many ways; still, the children of numbers of these are Americanized by birth, and I have heard lively discussions in families between Americanized children and foreign parents. A curious feature of these Islands is the number of children in private schools, the number amounting to about 30 per cent. of the whole. A large number of these are in Roman Catholic schools, and the lay teaching orders are American.

In the public schools, in which are the large majority of Hawaiian, Chinese and Japanese children, the "Americanizing" goes on, and here is one of the most interesting phases of the matter. The Chinese children are being saturated with American ideas. The theory that the Oriental mind is essentially different from the Occidental mind no one who teaches in Hawaii would consider for a moment. The environment being American and the teachers so largely Americans, the children have become possessed with a patriotic spirit, and curiously enough this, lighted by American patriotism, then burns for the enlightenment and progress of China. The officers of these Chinese institutions write back: "Your boys are leaders in studies, in sports and societies for advancement of religion and civil life. They burn with zeal for China and they impart their spirit to others." They are Americanizing the Orient. The Chinese here get ideas of the treatment of women and of Christian ideals of life. Last night I left a room where a hundred of our Hawaiian boys and girls, well mannered and perfectly at ease, were enjoying a Thanksgiving party. I walked over the Cathedral grounds, and seeing lights in our Chinese Sunday school rooms, I went in. There, with the young minister and the young warden present, were thirty or forty Chinese young women and men playing games. They were laughing at the efforts of a blindfolded girl trying to pin the tail on the donkey. Could such a scene be witnessed anywhere else in the world? Chinese young women and men of marriageable age enjoying themselves together! In China never speaking to each other until married, here getting to know each other, and, I presume, to love each other in a rational way! One couple there I knew were engaged. In the rear room I saw preparations for refreshments, American ice cream and cake! Americanized indeed! Why, I was at a Chinese home the other day and saw a young man call and hand a girl a box of American candy. We all know that the Chinese girl is chaste and modest, and she is so when she gets out of seclusion as well as when in it.

The Japanese are not so readily influenced by American ideas and life. In the first place, they are, when they come here, intensely patriotic, while the Chinese have little idea of any patriotic feeling. Then the Japanese use every means to keep their children Japanese in spirit. After the public schools close at 2 p. m., Japanese children are sent, if possible, to a Buddhist priest and taught

the Japanese language and patriotic principles. In order to hold the Japanese, the Buddhists adopt the Christian methods of Sunday schools and Sunday preaching services, besides night schools. Still the Japanese are influenced, the women especially being impressed with the conditions of women here. "I like Hawaii," I heard our Japanese woman say to my wife. "In Japan, man he up high, woman down low; in Hawaii, woman she up high too all same man." The children also, when they go back to Japan, as perhaps most of them do, will take some of the Americanizing which they have gained here, and it will not be lost. What makes all our work so important here is that under peculiarly favorable conditions we have an opportunity of teaching the Orientals something which they could not gain in their own land. It will all tell, and is telling, in the uplifting of the race.

The Portuguese young people take an interest in politics, and are learning American ideas. The Portuguese are a frugal and industrious people, and have a desire to vote for the best as far as they understand it.

The chief idea of President Roosevelt at this time as regards Hawaii is to Americanize the Islands by getting Europeans here. It is recognized that for white labor on the plantations the peasant of Italy or Portugal is the only available supply. The desire of the President is to get these people here and to assure each family the possession of a lot of land which will induce them to become stable residents. The plantation managers have spent immense sums of money in order to get the labor needed, but the only available kind since annexation has been Japanese, and these Islands are being thoroly Japanned. They are excellent laborers, but they do not stay on the plantations nor islands, and Hawaii is becoming a mere stepping stone for California. Besides, they have a way of crowding into trades, professions and mercantile pursuits and driving white people away. It is not cheap labor that Hawaii has. Men in the cane fields are getting $19 a month and upward, with a house, fuel, water and necessary medical attendance. This is considerably better than a dollar a day, which so many thousand laborers get in the States, and then the men here can work all the year round. Many of the Portuguese laborers have a house with a yard, in which they keep chickens, a pig, etc. With the work of their children they are enabled to lay by money, some of them several thousand dollars. Then the father looks around for a piece of land which he can get and on which he can make his living. Homestead lots have been taken by many in the Hamakua district, but from personal conversation with the Portuguese there I have yet to find one who is able to make a living on a homestead by growing anything which at present can be raised. In the Kula district, where they grow corn, they are more successful.

We want these homesteads occupied, but what can the people on them raise? Coffee will not pay; they have tried it and abandoned it. Pineapples must be near a cannery, and the market may easily be overstocked. Bananas must have a ready market. Some raise cane for the plantations and some grow corn. People theorize on paper about Americanizing Hawaii by getting people to go into small farming. I have yet to see one white man other than Portuguese who has succeeded or one practical man who believes it can be accomplished. I know of one white man who grows wheat for hay. When cut, he has to haul it six miles to a place where there is less rain so that it can be cured. Outside of a few who raise pineapples (employing Japanese labor), there is no crop which has paid on the Islands but sugar, and much has been spent in trials. A certain place, Wahiawa, is often quoted as having white men who raise pineapples. I was there the other day, and found that the original fourteen families have dwindled to five, some having leased and some sold out. Since then, the growers have organized a joint stock company with a capital of $400,000. While it is the opinion of the practical men of Hawaii that small farming by Americans will not succeed, there will be a number of small plantations where pineapples, sisal, rubber and tobacco will be grown. These are and will be owned by white men or companies of white men and worked by such labor as they can

get. To grow sugar requires a certain class of labor, a class content to remain laborers. This may be an un-American outlook, but it is the condition, and no one can deny it. It is the history of every tropical country in raising staples, and to disregard history is a folly. It is all very well for Americans to think: "History or law does not affect us; we are great enough to disregard them." So the old greenbackers argued, so the silver men said, but it does no good to "buck against" the laws of nature as proved by history and experience.

The President says he is decidedly against Orientalizing American territory. That is all very well; Hawaii was Orientalized long before it became American territory, but will the problem be solved by Latinizing, and incidentally Romanizing, American territory? The Portuguese, we know, are industrious people; they are law abiding, and their women are chaste. The Italians may be good; but to fill the Islands with them, whatever it may do from a labor standpoint, having a Latin peasant class here will not mean Americanizing the Islands. The Roman Catholic priests on the Islands are a fine set of men; I admire their devotion, and I like them personally, but I am simply stating facts when I say that the Roman mission here is carried on by the Society of the Sacred Heart, whose priests are chiefly Belgians and French. The coming of the Italians and Portuguese to take the place of the Orientals, who number three-fifths (perhaps now three-fourths) of our population, with the children attending, as far as could be provided, parochial schools, would this solve the problem of Americanizing these Islands? Or would it long solve the labor problem? We should educate the children of these people as far as we could in the American way, and then they would not want to work on the plantations. They would want to go into a store or get a political job. The old Portuguese know this, and they, themselves illiterate, say: "If the children are taught too much they won't work." As laborers, they mean, and, judging by the effect of our education on other races, their opinion, I believe, is correct.

In talking of Americanizing these Islands, we must remember that the staple product is sugar. A large capital is required to carry on a plantation, and there are years of loss as well as of gain. To start a plantation takes millions of dollars, some plantations employ over 2,000 men, and there are others on which the expense to pump water is $1,000 a day. Large irrigation systems cost hundreds of thousands. If sugar could not be grown here there would in a very short time be not one thousand white people here and few of any other races on the Islands. Many of the Hawaiians would leave, as they would not be content to go back to primitive conditions. There must be care lest Americanization means depopulation. Leases of large bodies of land soon expire. What is to be done with the lands? "Divide them up as homesteads," said a visiting Congressman to me. "What would the people grow on the land?" I asked. He did not know, neither does any one else. Nearly all the land now in sugar cane was previously cattle ranges, of which it took several acres to supply feed for one cow. Costly irrigation has made the change; destroy plantations and the land would revert to its former condition.

As to small farming, the Chinese and Japanese can make a living on land where no one else can. They are here putting the lava rock in piles and growing crops between. If white people go into small farming they have to compete with Orientals now here who do not intend to move. On the slopes of Haleakala are some hundreds of families raising corn; here is the only successful small farming which I have seen on the Islands, but no white man other than Portuguese, and few of these, can make a living there. I have for years lived on American farms and I know of what I speak.

In Americanizing the Islands we should show true American fairness to those who were brought here and who have by their labor so largely made the Islands what they are. We should show that Americanism means justice and fairness in our treatment of all men. I was in the family of an educated Chinese the other day, and two men, very intelligent, said: "How is it, Bishop, that

Americans who believe in Jesus Christ can be so unjust and unfair in their treatment of the Chinese? There are men on these Islands who came here in good faith before annexation and left their wives and small children in China, intending to send for them later. Do you think it Christian to separate families, to subject us to humiliation, to disregard the Constitution and compel Hawaiian-born Chinese-American citizens to get expensive papers before they can go to the mainland?" I told them, as they talked of these things, that some day the United States would suffer for this injustice. Some day China will have a navy and she will not forget. The boycott originated here and I was a witness of the act which first suggested the boycott. I saw the look on determined faces as they said to me, "We will write to Hong Kong and Canton and Shanghai about this." And another said, "We will urge them to buy no more American goods." Many of us here know that a Hawaiian-born Chinese, educated and Christianized, will make as good a citizen as a man of any race. Only Eastern people who do not know put the Japanese as superior to the Chinese in mental or moral qualities.

I hope that in Americanizing Hawaii we shall not do as we have done in Americanizing the Indian. However, let it be understood that true Americanism exists here in true American hearts, and yet many of us do not believe that, because a system works well in New England, it should be forced upon Hawaii or the Philippines, or that it will be forced upon them. If Britain adapts her government to conditions and races, why should not we? We have here American labor laws, exclusion laws, tariff laws, etc., and if any one suggests that these are not applicable here, his talk is said to be un-American. If Britain adapts her regulations to local conditions under the great principle of fairness, justice, expediency, why should not the United States do the same? The Americanization of Hawaii may be made to mean the ruination of Hawaii. Why is it American to have laws here put upon the Islands by Congress in the Organic Act which mean disaster? One law per-

PORTUGUESE GUAVA PICKERS ON THE HAWAIIAN EXPERIMENT STATION.

mits planters to lease Government land for only five years, and yet it takes nearly two years to mature a crop, and as crops come on and are harvested for nine to twelve months of the year, they have to be prepared for on the land for years ahead. Why is it American to prohibit corporations from acquiring over 1,000 acres of land when that acreage is not sufficient with which to conduct a plantation as things are today? These laws only invite schemes to get around what would otherwise mean ruin to the industry.

If the United States is going to hold foreign territory, let the Americanizing embrace great principles and their just application, and not the imposition of restricting laws and regulations, suggested by statesmen from the labor unions, or by men from Arkansas or Oklahoma, who know as much about Hawaii as they do about the moon.

Let Hawaii be Americanized by the application of great principles rather than by the application of selfish regulations such as the coastwise shipping law applied to these Islands 2,000 miles out in the ocean, and the tariff regulations made to protect industries in Pittsburg or in Lowell. The people here are all susceptible to true American principles. I am not pointing out a plan; I am describing conditions. Professor Willis, of Chicago, recently wrote of the government of island territory: "The American people seem prepared to accept hope rather than expediency as the basis of their policy." I believe that the people here who have brought this country to its present state could best solve its problems if given power to do so. At present laws are passed for us, imposing upon the Islands conditions against which our fathers rebelled in the thirteen colonies.

I do not believe that people in Washington who never saw the Islands and were never in the tropics, who know nothing about Orientals, nothing of our sole industry, nothing of our labor problems—I do not believe it is American that they should try to solve problems of which they have no conception and who put forth theories instead of recognizing facts. I believe that the Islands would be best Americanized if, under the control of the United States, we could work out our own salvation, and have the $1,000,000 or more a year which we now send to the United States from duties collected here over and above what is returned for salaries, etc. I believe that Hawaii can best be Americanized by the Americans here, who have made Hawaii a delightful place in which to live, where there was no need for a poorhouse, no beggars; where, as in no other land, races have lived together on good terms of sympathy and respect; where law was administered justly and without delay; where life and property were safe. This was Hawaii as Americans made it and as they handed it over to the United States.

HONOLULU, HAWAIIAN ISLANDS.

Is the Hawaiian Making Good?

BY DOREMUS SCUDDER, D.D.

SUPERINTENDENT OF CONGREGATIONAL MISSIONS.

RACIALLY he is dying out. But what of our ancestor the Briton? It would exhaust the resources of ethnological mathematics to calculate, in the case of any American of English forbears, the correct proportion of Briton, ancient Roman, Norseman, Dane, Saxon, Norman, Hollander and Huguenot-French in his hopeless upmix. Hawaii drifted into the interracial stream so late that the gradual absorption of a comparatively pure stock is happening before our very eyes. There is this added factor, that civilization had had time to originate some very virulent diseases and to establish in her own bailiwick a considerable degree of immuneness before she invaded this Paradise. Hence

her first contact with the non-immune Hawaiian was cruelly fatal. But he has practically recovered from this shock. He is now following the historic trend by blending into the common human family rather than by fading out of existence.

He is making good in the process; that is, he improves with miscegenation. It is not a one-sided transaction, for he gives as well as gets. Marry a Hawaiian to a Chinese and the resultant is every way a finer product. The output gains thru the Polynesian mother rare social charm, is more cosmopolitan, more approachable and courteous than the Celestial father, while the trick of making ends meet, industry, frugality and business sense gratefully testify to the hoary Asian heredity. This cross is universally liked and climbs high in positions of trust.

DOREMUS SCUDDER.

The white Hawaiian does not derive quite so much evolutionary stability from his father, who may have been a degenerate. But some of America's best blood has been imparted to the Islander, to say nothing of the sturdy European, who has done his share of intermarrying. These "half whites," as they are called, are a steadily increasing factor in racial evolution here. They are harder to manage than the pure Hawaiian, but are a distinct advance upon him. A goodly number of our most capable people—trusted, successful and in every way an honor to Hawaii—are "half whites."

When the race shall live only in past history it will be seen to have left behind a gentleness of disposition, a courteous dignity of bearing and an open-handed friendliness sorely needed by us sterner, more abrupt and selfish products of colder climes. In losing his racial life the Hawaiian will sweeten the cosmopolitan man now in the evolutionary alembic.

For eighty-seven years the best of Occidental civilization has focused itself upon Hawaii. Coincident with that best and preceding it for forty-two years, the world also turned loose its worst in the Islands. The little handful of missionaries who came hither to bring Christian ideals, reinforced by a few other foreigners of high character, were always far outnumbered by those whose evil lives issued a constant appeal to the Hawaiian to remain in savagery. This disparity so strongly affected that noble Christian naval officer, Captain Thomas Ap Catesby Jones, of the United States sloop-of-war "Peacock," in 1826, that in writing of the famous "trial" of the missionaries, in the house of Chief Boki, he said: "I own I trembled for the cause of Christianity and for the poor benighted Islanders, when I saw, on the one hand, the British Consul, backed by the most wealthy and hitherto influential residents and shipmasters, in formidable array and prepared, as I supposed, to testify against some half a dozen meek and humble servants of the Lord, calmly seated on the other, ready and anxious to be tried by their bitterest enemies, who on this occasion occupied the quadruple station of judge, jury, witness and prosecutor." In all the discussions as to the capacity of the Hawaiian for civilization it should

never be forgotten that from 1820 until today he has consistently, as a people, made choice of the better, when confronted first with Christianity and his own debasing superstitions; second, with universal education and continuance in ignorance; third, with constitutional government and absolute monarchy; fourth, for every man, woman and child of that race.

In 1890 one person in every eleven of those of Hawaiian blood, counting all sexes and ages, owned real estate; in 1896 the figures advanced to one in every eight; while in 1902 they reached one in every six. The national census of 1900

with acquiescence in annexation promising the Islands peaceful development and reactionary race hatred; and, finally, with lofty ideals of citizenship and the spirit of graft. This he has done in the face of sinister counsel, always ably presented by representatives of superior civilization.

So much for general historic statement. How is it with the Hawaiian of today in his approach to twentieth century motives? We Americans are keen for testing the staying power of a race by its industrial development. Up to 1839 the personal property sense did not exist in Hawaii, and it was not until 1848 that the native commoner came to own real estate in fee simple. In 1902, just fifty-two years years after the Great Mahele, or division of lands by the King, we find 37,656 Hawaiians and part-Hawaiians taxed for real estate valued at $12,817,278. This would be equivalent to a holding of the value of $340 shows that 43 per cent. of Hawaiian families owned their own homes, as against 28 per cent. for Caucasians living in the Territory, while for the entire American Union the figures are 44 per cent. But 85 per cent. of the homes owned by Hawaiians are unencumbered, while only 65 per cent. of those owned thruout the United States are recorded as free from indebtedness. After all that has been written concerning the exploitation of Hawaii by whites this is a suggestive showing.

Bulletin No. 66 of our National Bureau of Labor presents certain tables of occupations, wages, hours of labor and nationality of employees in a number of the industries of Hawaii in 1905. The report states that "No attempt was made to cover all establishments in the Territory, but in certain industries nearly all establishments of any importance are included in the table." Out of a total of 51,616 employees tabulated, there are

2,271 Hawaiians and 112 part-Hawaiians, or 2,383 in all. Of these, 1,557 are classed as laborers, while 826 are employed in occupations requiring more or less skill. These 826 are found in almost all of the trades, *e. g.*, engineers, firemen, carpenters, woodworkers, painters, paperhangers, plumbers, blacksmiths, boilermakers, machinists, molders, compositors, linotypers, pressmen, proofreaders, conductors, brakemen, motormen, ticket agents, freight clerks, electricians, linemen, masters of steam vessels, first and second mates, pursers, foresters (one), shop and gang foremen, etc.

As a general rule the white employee, whether American or North European, is paid higher wages than the Hawaiian, tho there are not a few exceptions. The four Hawaiian motormen and four conductors on the Honolulu electric system are paid the same wage as their white fellow workman. The highest wages paid to Hawaiians are $5.74½ per diem, received by the masters of two steamers, the seven American masters averaging $5.84 and the five other white captains $5.75. The two Hawaiian first mates, however, receive an average of $3.83½, while six Americans and two Germans of the same rank are paid only $3.45½ and two Englishmen $3.64½. Board is also added in the cases of these masters and mates. A careful study of the tables seems to indicate that where skill does not more largely determine the wage, the Hawaiian employee is apt to be paid on a basis regulated by the scale of living. Hence he receives less than the white American or North European, a trifle less than the Portuguese and more than the Asiatic. Doubtless for a like reason the part-Hawaiian is apt to receive more than his full-blooded brother. Where, however, skill is determinant of wages, the Hawaiian who excels may be even better paid than the white; thus a Hawaiian pile driver receives $3, while three Americans average only $2.33½; twelve Hawaiian painters on plantations (where free house rent is added) are paid $1.51; a German of the same craft $1.25. In the skilled trades, as a rule,

TYPICAL NATIVE HAWAIIANS.

however, the Hawaiians have not yet had time to become as proficient as their white competitors. Considering their heredity and the meager incentive in their environment, all luring toward the fitful activity incident to fishing and tilling the soil in the old-time way, together with the dearth of opportunity to learn modern trades, the record of 1 adult male in every 12 employed as a skilled laborer is most creditable. Out of 396 steam engineers in the Territory, no less than 59 are Hawaiians and 5 part-Hawaiians. There are 76 native overseers and 1 head overseer on the sugar plantations.

The report does not include mercantile establishments or Government offices, where a constantly increasing number are employed as clerks, bookkeepers and typewriters. Out of a total of 414 teachers in the public schools of the Territory in 1905, no less than 154 were of Hawaiian blood, as against 250 whites. The fierce competition that marks modern business practically shuts out the Polynesian. There are very few merchants among them. There are, however, a number of successful lawyers and many earnest, faithful clergymen.

The American people are probably more interested in the experiment of giving the franchise to the new races that annexation has brought into the Greater United States than in any other one feature of the expansion problem. There can be no doubt that Hawaii is shedding new light upon some of the details of this question. Two very important factors present here should not be overlooked. The first of these is educational preparation. At the very outset of their campaign the early missionaries began to teach the Hawaiian nation to read. Within a few years of their landing in 1820 it seemed as tho the entire population were mad with the fever to learn. As a result after one or two generations illiteracy was practically unknown on the Islands. The Hawaiian is a born booklover and delights to discuss what he reads.

Again, as early as 1840 a constitution was proclaimed by the King, and the people began to elect representatives. There were but seven chosen popularly out of fifteen in a single chambered legislature. In 1852 a second constitution instituted two houses, the members of the upper being appointed by the King, while those of the lower were chosen by universal suffrage. In 1864, under a reactionary sovereign, the pendulum swung back to a single house and a suffrage conditioned by a slight property qualification and by the ability to read and write. In 1887 a revolutionary movement substituted a fourth constitution with a ministry responsible to the legislature, two houses, the upper with members chosen by electors possessing a moderate property qualification and the lower a popular assembly. Thus Hawaiians were prepared for the present era of manhood suffrage by many years of progressive training in citizenship.

At annexation strong influences were brought to bear upon Congress to secure a Territorial Senate based upon restricted suffrage, but without success. Gloomy forebodings of native misrule were given wide currency, and the first few years under the Organic Act seemed to justify them. The first Legislature was shamefully bad, and the second hardly an improvement, while a number of Hawaiian officials proved corrupt. Yet nothing better could have been expected as the outcome of lost sovereignty, President Cleveland's doleful policy and the flocking together of cheap native demagogs and carpet-baggers from the mainland. The wonder is that the recoil from the strict control of the Provisional Government and the Republic to the laxity of Uncle Sam's gentle oversight was not more upsetting. The experience was salutary in convincing good men, both whites and Hawaiians, that the racial friction aroused by the Cleveland-Blount-Willis episode had no ground for existence, and that union for good government must prevail. The one commanding Island statesman who made this possible was Judge Sanford B. Dole, whose consistent policy, first as head of the Provisional Government and Republic and next as first Territorial Governor, ideally embodied justice to all. The man of the hour who seized the happy moment in 1904 to speak the word that brought Hawaiian and white into happy co-operation was our present Governor,

George R. Carter. The election of that year gave a Legislature that would suffer by comparison with none on the mainland. Finally, last November, in Oahu County, the opportunity was granted the Hawaiians to decide between a graft-corrupted machine, identified with the Republican party, to which they had begun loyally to turn, and independence of political action. Thus the crowning test of ability to wield the ballot in obedience to twentieth-century principles was clearly applied to the native race. They came forth from the ordeal triumphant. The machine was buried past resurrection and that by Hawaiian votes. The history of the past six years reveals a power of self-government in this race of a quality scarce believable. The historical student, however, sees in it no miracle. Not only did his previous political history affect his capacity for self-mastery, but his church polity also even more fundamentally trained this power. In 1863 the Hawaiian churches were freed from missionary control and set forth on a career of self-government. Modeled after the Puritan pattern they taught this people how to think, debate and vote from conviction. Tho the Church did not gain so much from this experiment, the State did, and is now reaping its results.

In fine, it is not too much to say that the hope of honest government for this Territory lies to no small degree in the Hawaiian, and that there is the best of reasons for believing that he will justify expectations. Congress made no mistake in granting manhood suffrage to its mid-Pacific Territory.

Superficial critics are wont to speak slightingly of the religious life of the Hawaiian, and the assertion is not uncommon that the Christian native is but a whitewashed pagan. Not a little may

Copyright, 1901, H. C. White Co.

AN AVENUE OF ROYAL PALMS IN THE SUBURBS OF HONOLULU

be urged in support of this contention by those who have not wide and deep acquaintance with the Islanders or who are devoid of historic sense. A pretty volume could be made out of the topic "American Pagan Superstitions." Yet

The test of Christian character, however, resides more in the upbuilding of positive virtues—honesty, chastity, kindness, peaceableness and the like, which go to make up brotherhood—than in a total elimination of the background of

A GROVE OF COCOA PALMS.

we have had more than one thousand years' start of Hawaii in Christian heredity and environment. Intimate connection with the natives excites only wonder that less than one hundred years should have taken so completely out of their lives the debasing conceptions which ruled their great-grandsires. When one recalls the success in America of innumerable quacks, "Indian" doctors and nostrums galore, to say nothing of the extremes of faith cure, Christian Science, divine healing and the like, the exceptional Hawaiian, in his resort to a Kahuna (witch doctor), seems not so unreasonable. Occultism will take generations to kill, and in this regard the American has no right to cast a stone.

fears inherited thru untold ages of ancestors. It is here that the Hawaiian is giving surest evidence of the radical change wrought in him by our common religion. So far as assemblies, preaching, singing and other emotional manifestations of a belief in God go, the Islander is of course the peer of any people, but this is not the question.

Is he truthful? To answer this inquiry in the case of any race is not easy. Are Americans truth tellers? The reply will vary with each one's knowledge of individual Americans, or his acquaintance with certain circles of finance. Yet it cannot be doubted that as a whole Americans are truthful. We are still evolving as truth speakers and have by

no means reached the goal. It is entirely unreasonable to expect in a people but eighty-six years removed from savagery as complete an average development of the idea of truth and of obedience to the ideal as we show. When this is said, it can be added that the degree of truthfulness evidenced in ordinary affairs by the Hawaiians is a remarkable tribute to the power of Christianity. There is simply no comparison between him and the Italian as pictured by Macaulay in one of his famous essays. He will falsify under stress, but then, what average man of any race will not? It is largely a question of the degree of stress. With the Hawaiian the breaking point is fairly high, taking the whole human world into consideration.

How about honesty? Secretary Taft, in an address at his alma mater not long ago, sketched vividly the agelong development of the idea of personal property. As has been remarked, until a half century or so ago, the Hawaiian commoner never conceived the notion, except as a dog does his bone. Since that time he has advanced centuries in decades. The tendency to breach of trust in spending funds for which he is responsible is all too common. It is not, however, evidence of criminal intent, as it would be with us, but rather of lack of the property sense. That progress in the acquirement of this idea is being made with rapid strides, particularly since annexation laid wider responsibilities upon Hawaiians, is a matter of common observaton. The race is steadily making good in honesty.

A more vital inquiry relates to chastity. Before the advent of Christianity here this was absolutely unknown and unguessed on these Islands. Promiscuity ruled supreme. Here, it seems to me, the triumph of the moral ideal has been more marked than anywhere else, especially when it is borne in mind that Mormonism has been present with its deadly poison for decades, and that since the early days of discovery the unprincipled white man has fought every step of the way to purity of home life with a fierceness of which our American mainland knows nothing. Besides this, the Hawaiian home is exposed to the frightful assaults of the horde of young, unmarried Asiatics, themselves devoid of chaste ideals. How any upbuilding of pure family life could be expected under this combination of conditions passes human wisdom to conceive. Yet it has been and is being done. Young girls subjected to temptations unguessable in the States are being trained to resist. Pure homes are growing in number, and with increasing frequency lapses in youth are followed by reformation both lasting and of wide influence. Christianity undertook its mightiest task in the endeavor to frame in this climate, out of the most unworkable materials, an ideal of chaste living, and it is succeeding.

In the other virtues Hawaiians need fear no comparison with us who boast a Christan ancestry many fold longer. They are determined to spare no pains to lift themselves still higher. They do not begrudge expenditures for education which would give serious pause to legislators on the mainland. The total school attendance of children of native stock has steadily increased from 7,911 in 1903 to 8,267 in 1906. Little by little the ambition to be worthy of the new century is getting its grip upon their hearts. Not a few are beginning to leave the Territory for higher education on the mainland. Any serious-minded student of human progress who thoughtfully transports himself back one short hundred years must confess that one of the miracles of history has been enacted on these faraway islets, and that the Hawaiian has justified many fold the gifts which civilization has made him.

HONOLULU, HAWAIIAN ISLANDS.

SANFORD B. DOLE.

Land Settlement in Hawaii

BY SANFORD B. DOLE, LL D.

Ex-President of the Hawaiian Republic and Judge of the United States District Court of Hawaii.

IN this paper I desire to discuss the subject of the disposition of such public lands as are suitable for settlement purposes.

The Land Act of 1895 indicates a pronounced policy toward the use of such parts of the public lands as are suitable for settlement, for the project of increasing the number of small proprietors who shall either own their lands, or, under the homestead lease system, control such lands as may be taken up by them so long as they and their descendants may occupy and use them. Professor Alexander's statement of the public lands is briefly as follows:

Area, 1,720,000 acres, divided into the following classes:
Waste lands, approximately 500,000 acres.
Forest lands, approximately 600,000 acres.
Grazing lands, approximately 400,000 acres.
Agricultural lands, approximately 220,000 acres.
Wet lands and sugar lands, approximately 25,000 acres.

I am informed by the Commissioner of Public Lands that the Government now holds about 669,548 acres of public lands not subject to leases, and that out of this amount 10 per cent. approximately, or about 67,000 acres, are now available for settlement as agricultural and pastoral lands, and that with necessary roads the proportion of agricultural to grazing lands in this area would be very largely increased.

Old leases are expiring from time to time, thus constantly adding to the extent of available lands suitable for settlement purposes. I do not purpose to discuss the policy of using lands hitherto occupied by the sugar plantations in the cultivation of sugar cane, for the settlement of small proprietors, under the ex-

pectation that such proprietors will continue the cultivation of sugar cane thereon, to be reduced to sugar on shares or purchased outright by the neighboring sugar factories, but it would appear from the figures given above that at present and for a considerable time to come the important enterprise of establishing small proprietors on the public lands can be carried on without interfering with the operations of the sugar plantations in relation to such public lands as they have hitherto occupied under lease.

The immigration of over a thousand Portuguese within the last few days from the Azores has attracted much interest, both here and at Washington, and it must be regarded as an enterprise of great importance to this country, and as one which, if successful, is likely to lead to the introduction of a larger number of similar immigrants. The arrangements which have been made to furnish those of these immigrants who may be employed by the sugar companies with small holdings suitable for homes and the cultivation of products to be consumed by themselves and perhaps sold to some extent, the fee simple of which holdings they may acquire, are full of promise for the permanent establishment of these immigrants on the plantations on which such holdings are situated. There is little doubt but that if such a plan had been adopted by the sugar plantations at the time of the first introduction of Portuguese immigrants, twenty years ago, a much larger proportion would have been contented to remain and perform field work on the plantations than has been the case.

Altho the children of such immigrants will be educated in the public schools, they will be attached to the homes be-

longing to their parents, and a considerable proportion of them will in all probability remain and perform work of various kinds for the plantations. This enterprise will fulfil two objects, a supply of labor and a substantial addition to the Portuguese element of the population of the country, a class noted for thrift, economy and law-abiding tendencies, whose capacity for citizenship increases with each generation. Allowing to this enterprise all the advantages which the most sanguine may claim for it, it is yet evident that the work of recruiting citizens for Hawaii should go farther. The cosmopolitan character of the population of the Territory is well known. Large numbers of Japanese, a smaller number of Chinese, Koreans, the Portuguese referred to, the Hawaiians and part-Hawaiians, and scattering representatives of other races and the comparatively small number of persons who are of Anglo-Saxon descent, make a showing which only needs to be studied to produce a strong conviction that in order to develop a citizenship here that will be always improving in those characteristics which are recognized as the highest attributes of American citizenship, it is essential that the class referred to as Anglo-Saxon should be largely increased, and particularly that it should be increased by the introduction of persons from the mainland who have acquired by long residence and particularly by inheritance and position the qualities of citizenship above referred to.

As yet but little has been done in the way of introducing Americans from the mainland to these Islands. Altho the preparation of the Act of 1895 was distinctly made with that object in view, together with the general purpose of furnishing small farms to such inhabitants of the Territory as were landless and desired them, there were obstacles. At first, the small amount of available public lands not subject to leases, and always the want of suitable roads connecting otherwise suitable lands with the main public roads; the difficulty also of organizing a system of inducing such migration has doubtless led to delay and

A FIELD OF CORN ON THE LOW LANDS AT KULA MARIO.

to the easier alternative of disposing of such lands to persons already in the Islands.

About seven years ago there was a demand for a small piece of public land on the Island of Oahu, known as Wahiawa, of an area of about 1,400 acres, by persons from Southern California, one of whom investigated the ground and organized a colony for its settlement. This was accomplished under the provision of law known as a Settlement Association, by which a number of individuals, over six, may apply for holdings in one locality without competition from others. This provision is particularly convenient and even necessary as a scheme of inducing immigration from the mainland, because otherwise the absent applicants for land would have no guarantee of performance, but would be in disadvantageous competition with persons resident in the Islands. Some fourteen persons, most of them with families, took up this section as a settlement association under the right of purchase system. The land was appraised at five dollars per acre or less, and the colonists proceeded to build houses and improve their holdings and to live thereon. This land was regarded by those acquainted with the lands of the Island of Oahu as inferior. The colonists experimented with different kinds of fruits and vegetables, and struggled along for several years without finding anything that was especially profitable as a standard crop. At length they experimented with pineapples, and these were found to grow luxuriantly and to produce heavily. They had a small market in Honolulu and a large market on the Pacific Coast. Canning factories were at length set up, and these colonists began to make money from the sale of their pineapples to the canneries or in conducting the business of canning and exporting. The land which they originally procured at five dollars an acre or less is now selling for over two hundred dollars an acre. These colonists were Americans, were enterprising, persevering and industrious, and their great success is, I think, attributable largely to these qualities. Colonists of a different class might eventually have reached a similar success, but would have taken a longer time to do it. Altho this experience is not likely to be exactly duplicated in other parts of the Islands, yet there are available at the present time considerable

FLUMES AND RAILROAD FOR CARRYING SUGAR CANE TO THE MILL.

areas of fertile soil within practicable reach of the public roads, where American farmers could raise all of the usual American farm crops and produce substantially everything required for their own use except dry goods, hardware, flour and some of the groceries.

Altho wheat can be raised, it cannot be grown profitably, as the flour produced is inferior to American flour. Substantially all of the forage crops can be successfully raised.

The farmer needs a money revenue, however, and what this shall be would depend somewhat on the locality of his farm. Coffee has long been profitably raised. Tobacco has been experimented with and promises to be a most profitable crop. Rubber is being grown with every promise of success. Sisal is being produced and manufactured of fine quality and does well in localities where the rainfall is comparatively slight. Bananas have long been profitably exported to the mainland. It is probable that such farms as will be conveniently within reach of the large seaports will be able to do a profitable business in raising and shipping vegetables and fruits to the Pacific Coast during their winter months, when the home supply is at a standstill.

Colonel Hepburn, of the House of Representatives, who spent some months in the Territory last year in going around the Island of Oahu, was much impressed with the appearance of the land in the neighborhood of the Wahlawa Colony referred to above. It impressed him as land upon which his neighbors in Iowa would be able to make a better living than at home, and stated, as I was informed, that the farmers of Iowa, or in his neighborhood in Iowa, did not net more than seven or eight dollars an acre per annum—probably meaning in addition to what they themselves consumed on their farms. People in these Islands engaged in agriculture would consider that such profits were not far removed from failure.

From a business standpoint the settlement of American farmers in this country is most important in that, as compared with settlers of other races, they are greater consumers and more largely patronize the mercantile establishments of the place. Agricultural implements, lumber, dry goods, groceries, flour, furniture and many other things are required by them, and the colony, like the one referred to, is of no small value to the business of its nearest city.

Even greater than this is the importance of such an addition to our population to the political condition in these Islands, where voters of the Anglo-Saxon race are comparatively few, as shown by other papers in this number. Japanese and Chinese children, as well as those of other races, are becoming a large element in the schools of the Territory. The majority of them have been born here, and therefore the boys on coming of age will be entitled to the franchise. Altho these boys going thru the course of education in the schools of the Territory, public and private, and associating in the schoolroom and on the playground with the pupils of the other nationalities, will be, as a rule, good American citizens, yet with their own race traditions and their attachment to their own people in the home land, it is evident that a strong and numerous element of boys and girls from American families is indispensable for the continuous and best growth of American sentiment. Socially this American element is no less important as furnishing a powerful influence in favor of Anglo-Saxon ideas of family life and social customs and precedents. Five hundred American families contentedly living on farms owned by them would go far toward safeguarding the social and political future of this community, and one thousand of such families would be a most satisfactory guarantee for the future development and progress of the best element of American citizenship.

Fortunately after annexation the Federal administration very definitely indorsed the existing policy in favor of the settlement of the public lands, so far as practical, by those who should own and cultivate the lands occupied by them. This makes the work of the Territory in this direction comparatively easy, for it has always behind it the backing and insistent desire of the Federal administration that such policy shall be energetically continued and carried out.

HONOLULU, HAWAIIAN ISLANDS.

The Hawaiian Judiciary

BY WALTER F. FREAR, LL.B.

Chief Justice of the Supreme Court of Hawaii.

WHEN Hawaii was annexed to the United States, on July 7th, 1898, she already had as an independent sovereignty a full-fledged constitutional government. This, moreover, was republican in form, and the constitution under which it had been organized, on the Fourth of July just four years before, was one that was as remarkable for its adaptation to the unique and complex conditions that it was designed to meet as it was for its embodiment of much advanced thought on constitutional subjects. The circumstances manifestly required that legislation by Congress concerning Hawaii should proceed upon the principle of adaptation and growth rather than of preconceived theories of government. Accordingly the existing government was allowed to continue for two years, and meanwhile the commendable course was pursued of leaving to a commission, consisting of representatives from both the United States and Hawaii, the framing of the necessary legislation. The natural result was an organic act composed largely of borrowings from the constitution of the republic of Hawaii, with such changes as seemed called for by the new relations into which Hawaii had entered, and a Territorial Government of a type higher or more nearly approaching that of a State than any that had been created previously, altho the act as drafted by the commission was not passed without several amendments of a retrogressive character.

The principal changes in judicial organization and procedure consisted in the transfer of the appointment of the Supreme and Circuit Court judges from the President, now Governor, of Hawaii, with the consent of the local Senate, to the President of the United States, with the consent of the National Senate; the reduction of the tenure of the Supreme Court justices from life to four years and of the Circuit judges from six to four years; the introduction of the grand jury; the requirement of unanimity in the verdicts of trial juries; the abolition of racial and mixed juries; and the creation of a distinct Federal Court, namely, a District Court having also the jurisdiction of a Circuit Court. The principal jurisdictional change resulted from the creation of the Federal Court, whose

W. F. FREAR,
Chief Justice of the Supreme Court of Hawaii.

jurisdiction naturally was to extend over certain classes of cases, such as admiralty and bankruptcy cases, which had previously been within the jurisdiction of the Hawaiian courts; but, on the other hand, the latter were to be called on to decide incidentally many questions arising under the Federal Constitution and laws. Of these questions the one that excited greatest interest was whether the Constitution followed the flag to Hawaii immediately upon annexation,

and particularly whether the provisions relating to customs duties and grand and trial juries were applicable to Hawaii during the transition period between annexation and the establishment of Territorial Government. The view of the Territorial Supreme Court that those provisions were not applicable during that period was afterward sustained by the Federal Supreme Court.

As compared with other Territories a higher status of organization and self-government was allowed to continue in Hawaii, by providing, as in the several States, for distinct local and Federal courts, instead of having, as in other Territories, only one set of courts to exercise both local and Federal jurisdiction; by permitting the local courts to continue with a Supreme Court of appellate jurisdiction and distinct superior courts of original jurisdiction presided over by different judges, instead of providing, as in other Territories, for only one set of judges to sit singly as superior courts for the trial of cases in the first instance and together as a Supreme Court to hear appeals from its own members; and by providing that cases might be taken on writ of error to the Federal Supreme Court from the Territorial Supreme Court as from a State Supreme Court only when a Federal question was involved, thus leaving the local Supreme Court the final arbiter in local cases, instead of allowing, as in other Territories, appeals also in local cases involving over $5,000 in value. Recently, however, a mainland corporation, which had lost a case in Hawaii, procured the enactment of an amendment to the organic act so as to permit an appeal in all cases involving more than that amount, and moved for a rehearing in Hawaii so as to suspend the judgment for the purpose of taking an appeal after the passage of the amendment. The amendment was rushed thru in the closing days of a session of Congress and Hawaii learned of it for the first time after it had become law. It is, of course, a splendid privilege to be allowed to take a case to such a court as the Federal Supreme Court, and yet it may well be asked why the burdens of that court should be increased by cases of purely local concern, and why such cases should be taken to that court from a Territory—especially one that is the successor of an independent sovereignty—any more than from a State.

The Hawaiian judiciary, however, was not the creation of the constitution of the republic. The change from monarchy to republic was less marked than that from republic to Territory. The former scarcely affected the judiciary. Hawaii had already reached a high plane of constitutional government—and all by a process of evolution. She, indeed, presents a complete history of a growth from absolute government by a despot to constitutional government by the people.

The Territorial judiciary comprises the usual three grades of courts—a Supreme Court, superior courts of record, called Circuit Courts, five in number, and inferior courts, called District Courts, twenty-nine in number.

The Supreme Court consists of a chief justice and two associate justices. It holds one term a year, beginning on the first Monday of October and continuing until final adjournment, which is usually about the beginning of the following summer. Its jurisdiction is mainly appellate. Its original jurisdiction is confined chiefly to claims against the Territory, county election contests (formerly legislative election contests), writs of habeas corpus, and extraordinary writs directed to other courts. In case of the absence or disqualification of a justice his place may be filled by a circuit judge. The decisions of the court have been published during the last sixty years in reports, of which there are now seventeen volumes. During the last few years, such has been the increase in the work of the court, a large volume has been published annually. A proposition to increase the membership of the court from three to five has been much discussed during the last few years. This originated from a supposed necessity for an increase to enable the court to catch up with its calendar, but this was accomplished some time ago, and now the argument for an increase is based on the greater satisfactoriness of a decision by a larger court, especially if one member should dissent. It would also obviate in some degree the supposed necessity of appealing to Washington in cases

THE JUDICIARY BUILDING, HONOLULU.

which do not involve Federal questions. The Circuit Courts sit at regular terms with a jury, unless jury is waived, for the trial of original law cases not begun in the District Courts and in cases appealed from the District Courts. The circuit judges sit without a jury thruout the year in equity, probate and divorce cases; formerly they sat also in admiralty and bankruptcy cases. Each circuit has one judge, with the exception of the first, which, owing to the large amount of business in that, has three judges, who sit separately.

The District Courts, sitting without a jury, have criminal jurisdiction over misdemeanors, and civil jurisdiction in cases, except certain classes of cases, involving values up to $300. By consent the accused may be tried in the district in which he is arrested, if that is different from the one in which the offense was committed. If the offense is not of a serious nature he may be summoned to appear, as in civil cases, without arrest.

There are several courts of a special character that deserve notice.

A court for the registration of land titles under the so-called Torrens system was established a few years ago. Registration is optional and applications have been comparatively few in number, but are gradually increasing, as the benefits of the system come to be better understood.

Juvenile courts also have been established recently. These, however, are not distinct courts, but the jurisdiction is exercised by the Circuit and District Courts. These are authorized to appoint probation officers, under whose supervision delinquents under the age of sixteen years convicted of any offense punishable by not more than two years' imprisonment may be placed, instead of being sent to an industrial school, the sentences to be meanwhile suspended. Juveniles under that age are required to be kept separate from older offenders when under arrest and to be tried at a differ-

cut time. The results of the law have been highly satisfactory, especially as administered by the District Court of Honolulu, where alone it has been operative to an appreciable extent.

There have been for half a century special courts for the adjustment of private ways and water rights. When the feudal system had reached its full development and was finally converted into an allodial system by the issuance of awards to all rightful occupants, it was found that many lands were entirely surrounded by the lands of others over which rights of way were needed. The Hawaiians anciently developed elaborate systems of irrigation, by which water was led from streams in ditches and distributed by quantity or time among those entitled to water, the method of division varying in almost every valley. These two matters were deemed to be of such importance and of such a character as to require a separate tribunal for their adjudication. The jurisdiction is equitable in its nature, but of greater elasticity than the ordinary jurisdiction of a court of equity. The present incumbent for the district of Honolulu is a part Hawaiian woman.

The jury system, as it existed before annexation, presented several interesting features. Trial by jury was introduced in capital cases as early as 1825, on the advice of Lord Byron, a cousin of the poet, and in civil and other criminal cases in 1842. The jury consisted of the usual number, twelve, but a verdict could be rendered by nine, except that until 1847 unanimity was required in capital cases. In a criminal case against a Hawaiian or a civil case between Hawaiians, the jury was composed of Hawaiians. Similarly, in cases affecting foreigners, it was composed of foreigners. In a civil case between a foreigner and a Hawaiian it was composed of foreigners and Hawaiians in equal numbers. Foreigners for the purposes of jury duty included all persons of foreign descent, whether aliens or citizens, and Hawaiians included part as well as pure Hawaiians. The practice of dispensing with unanimity worked well, and much regret was felt that it had to be abandoned on the extension of the Federal Constitution to Hawaii; but the racial feature, which was abolished by the Organic Act of the Territory, had long survived its necessity and would probably have been abandoned soon in any event. Now juries are composed indiscriminately of citizens who understand the English language, whether of Hawaiian or other blood. Most Hawaiians understand English. They make conscientious jurors as a rule. The grand jury never existed in Hawaii until the establishment of the Territorial Government.

The Supreme Court justices and Circuit judges are appointed, as already stated, by the President of the United States, with the consent of the Senate; district magistrates are appointed by the chief justice of the Territory. The former hold for four years (before annexation the terms were for life and six years respectively); the latter, for two years. No judicial office in Hawaii has ever been elective. The chief justice receives $5,500 a year; associate justices, $5,000; circuit judges, $3,000; magistrates from $120 to $2,400. The members of the Supreme and Circuit Courts have long been of English or American descent. Recently a member of the Supreme Court was a Portuguese. At present one of the circuit judges is a Hawaiian. The majority of the district magistrates are Hawaiians. At present the members of the Supreme Court are Yale and Harvard men. The Hawaiian judiciary, during most of its sixty-six years of constitutional history, has been free from politics to an unusual degree; public opinion has insisted that this branch, at least, of the Government should be kept independent and above suspicion. For these and other reasons judicial office has been held in high esteem. Good and able men have usually been willing to serve, and the ablest and best available have generally been appointed. The bar is composed of two classes—those who may practice in all the courts and those who may practice in the District Courts only. The former are mostly whites, the latter mostly Hawaiians. A high standard is required for the admission of the former. The members of the bar, ever since the arrival of the first lawyer in 1844, have been in large part men of ability, high character and public spirit, often sacrificing lucrative practice for longer or

shorter periods to serve the public interests. Owing to the cosmopolitan character of the population, made up as it is of large numbers of Hawaiians, Japanese, Chinese, Koreans, Porto Ricans, Portuguese, Americans, English and Germans, as well as smaller numbers of other nationalities, there is not only much racial variety among judges, jurors and lawyers, but still more among parties, witnesses and interpreters.

The practical administration of justice has usually been characterized by simplicity, directness and dispatch. Procedure is based on English common law and equity practice, but with the omission of useless forms and fictions. There has been no fusion of law and equity cases, altho some features of the code pleading and practice have been introduced. The same circuit judges sit in both classes of cases, but as distinct courts, each with its own procedure. All the courts are practically up to date in their work, and a case may be put thru all its stages in both original and appellate courts with expedition, little expense and the assurance of an impartial decision. The proverbial law's delays are not serious in Hawaii. The first Circuit Court, it is true, has been unable to keep pace with its calendar for some years, and this was true of the Supreme Court for a few years recently, but that condition is now a thing of the past. Juries have usually performed their duties well; Hawaii's annals are comparatively free from the classes of verdicts that in many places have tended to bring the jury system into disrepute. The percentage of convictions in criminal cases is large. Corporations stand about as good a chance with juries as private persons. There has been an increasing tendency of late to prolong trials, with a corresponding tendency toward the view, which seems to prevail in many States, but which has not made much headway in the Federal and English courts, that a trial judge is a mere dummy, or at most a weak umpire to preside over a play between counsel. As long as fourteen years ago a statute was enacted forbidding judges to comment on the evidence, but that may be invalid now under the view that the right of a trial judge to advise the jury on the facts is an essential element of trial by jury as preserved by the Federal Constitution. The Legislature also, at its last session, expressly authorized trial judges to exercise greater control over the examination of jurors on their *voir dire*, for the purpose of shortening the time wasted by counsel and preventing the exclusion of the better class of jurors. It also expressly authorized trial judges to permit juries to separate during intermissions in capital as well as other cases, in order to save expense to the Territory in long trials and lessen the inconvenience to jurors. No bad consequences have resulted. The doctrine of a "scintilla of evidence" does not obtain, and judgments *non obstante veredicto* are granted on the evidence as well as the pleadings, and for the defendant as well as the plaintiff when the material facts are undisputed. The doctrine of presumed prejudice from error is given little weight; the Supreme Court does not readily grant new trials unless there is good reason to believe that injustice may have resulted from error commitment by the trial court. The number of cases, for various reasons, is rather large in comparison with the population. The Supreme Court disposes of about 125 cases, mostly civil, a year; the Circuit Courts, about 1,000 civil and 500 criminal cases; and the District Courts, about 2,000 civil and 10,000 criminal cases.

The law, both written and unwritten, administered by the courts is much what one might look for on the mainland, with such differences due to local conditions as are found in the various States. Formerly the written law consisted of the Constitution, treaties and statutes. Now there are no Hawaiian treaties, and there is no constitution aside from the Federal Constitution and the organic act of the Territory. The constitutions were always confined to a bill of rights and frame of government—not elaborated into little codes, as in many States. Treaties were held of superior force to statutes, thus rendering it impossible for the legislative branch of the Government to break faith with other nations; and, as a matter of international comity, criminals were delivered up upon a proper showing, in the absence of treaty provisions on the subject of extradition. As to statute law, there has been no attempt

at general codification. The code procedure has not been adopted. There is no civil code of substantive law. Penal offenses, however, are wholly of statutory definition. Anciently, statutes were enacted orally, proclaimed by heralds and preserved in the memory of specially trained persons — living statute books. The first printed law was published in 1825; the first compilation in 1842. The first laws strictly on modern lines in form as well as in substance were the comprehensive acts of 1845, 1846 and 1847—drafted by one learned in both the common and the civil law—organizing the several departments of Government and containing much other matter. These were largely declaratory of what had already been evolved with little aid from statutes and have been the basis of Hawaiian organic law ever since. In 1850 a modern penal code was adopted. The last compilation and revision of all the statutes was enacted in 1905. Conservatism has been the rule in legislation. Statutes, passed at annual and later biennial sessions since 1839, have been comparatively few and simple and have in large part been borrowed from the best Federal, State, English and colonial laws. Case law likewise does not differ much from what is found in America and England. English and American cases are cited in decisions just as they are elsewhere. The Supreme Court library contains more than 8,000 volumes. Many novel questions have arisen, it is true; but, as a rule, it has been found possible to decide them by the application of old principles. Until 1892 the courts were authorized to decide according to natural law and reason, and to resort to the reasoning and principles of the laws of other countries, but in practice they usually followed the common law. In that year the common law was enacted except as changed by Hawaiian statutes, judicial precedents or usage. Perhaps Hawaii cannot be said to have a parent State in respect of her law, but she has followed that of Massachusetts, both statutory and judicial, more than that of any other one State.

HONOLULU, HAWAIIAN ISLANDS.

Honolulu

BY WALTER GIFFORD SMITH

EDITOR OF THE PACIFIC COMMERCIAL ADVERTISER.

WHILE Honolulu has not lost its earlier and distinctive charm, it has grown into a city of modern aspects and facilities. What survives of native ways of living is not much seen in either the ground plan or architecture of the place, tho it may be felt in certain existing customs and modes of hospitality. A stranger searches in vain for the grass hut and the half-naked savage of the postal cards. It is much easier to find the adobe house and the Mexican vaquero in California. Honolulu, in its chief characteristics, belongs as much as do any of the American coast cities to the twentieth century.

This is one of the first thoughts of the sea traveler on approaching it. Honolulu, save for its palm plumes and its background of extinct volcanoes, might pass for any prosperous American summer capital and small commercial port. There are the busy tugs and coasters in the harbor, the moored deep-water ships, the docks, marine ways, warehouses, oil tanks, the brick and stone business section, with six-story structures here and there, and beyond are the shaded villa homes, stretching over a plain, where church spires now and then emerge from trees, climbing the slopes of hills and lined up along a nearby curving beach, where the suburban hotels and bathing resorts abide.

Fifty years ago one landed in Honolulu from an outrigger canoe, manned by swarthy natives, who had paddled a mile or more to meet the ship. Now an ocean liner ties up at a fine dock, one of many, and the passenger, after giving his

checks to the baggage man, steps off into a waiting hack or automobile. He rides to his hotel thru macadamized streets, which are also traversed by electric cars. He sees telephone, fire alarm and electric lighting wires, and notices that people are buying and selling the same classes of goods, save those inhibited by the climate, that he saw last in the store windows of Chicago and San Francisco.

One thing especially suits his ideas of what a city should be—the general cleanliness of streets and people. And that is one of modern Honolulu's best points. Sometimes a Northern town may let dirt accumulate without having men decay — a tropical one, never. A Southern seaport, especially, must be always on its guard against diseases of the torrid zone, which are left by ships that touch and go. It took some years and some punishishments to teach Honolulu the gospel of sanitation, but it has learned the lesson, and now the city finds itself complimented in the report of the Surgeon-General of the Army as being the second healthiest post in which United States troops serve, Alaska appearing as the first on the list.

W. G. Smith.

To specify some details of interest in brief form: Honolulu has from 45,000 to 50,000 inhabitants, about 7,000 of whom are of unmixed Caucasian blood, the rest being Hawaiians, Portuguese, Japanese, Chinese, Koreans, Porto Ricans and negroes (the latter being few); 150 miles of well-cared-for streets, which are lengthened, in some instances, by macadamized highways, reaching far into the country. There are five parks. Few modern comforts or public utilities are wanting in Honolulu, whose people, being wealthy and public-spirited, have not been willing to lag in the path of progress. Long before the telephone came into general use elsewhere it was operating here, and its system now covers not only the capital city, but all the Islands of the group. All the Islands of the group are connected with Honolulu by wireless telegraph, and Honolulu with the world by cable. An electric car system of the most modern kind gives the city rapid transit, and the greater part of the island behind it is served by a railroad. Two electric lighting plants and one gas plant exist, there are three ice factories, two iron foundries, three daily newspapers in English, receiving Associated Press cablegrams twice a day, and about twenty-five other publications. The banks number seven, three being Asiatic branch establishments. There is a stock and bond exchange, various trust companies, a paid fire department, a growing system of waterworks, and well-drilled police and militia, backed by a garrison of regular infantry and marines. Honolulu is governed by county supervisors. A place of education, religion and refinement, Honolulu has twenty-four church edifices, a college doing really useful work, public schools accommodating 4,289 pupils and private schools serving the intellectual needs of 3,110, the attendance being wonderfully mixed as to race; a public library and museum, a historical society, four social clubs, one being of university derivation; the Y. M. C. A. and Y. W. C. A.; Young Men's Institute, two cathedrals, branches of all the principal secret fraternities; six or more charitable societies, two opera houses and two well-endowed hospitals; and the list of material and ethical belongings of Honolulu might be consid-

erably lengthened if space permitted. The dominant white population of the city is of very high class. It has its foundation in New England missionary stock, but to its solidity and its polish many other strains than those represented in the American religious pioneers have contributed. Commerce and the professions have winnowed the civilized world to give of their best to Hawaii, and this despite the importunity of wider fields. It is natural that the great capitals should claim the ablest men, but the health-seeking impulse is one that often takes from the metropolis its choicest spirits to enrich the smaller places where nature is benevolent. There is no better society anywhere than that which is dominant in Southern California and in Hawaii. It is largely college-bred; it has shown itself to possess the right ideals of civic duty; it has a taste for great things in commerce and in all other forms of legitimate industry; it nourishes self-respect and a wholesome patriotism. Good lawyers and preachers, skilful physicians and surgeons, authors, painters and musicians, scientists and poets, captains of industry, are found in any place which gives them an honest hope of longer life and usefulness. Distant, therefore, as Honolulu is from the centers of civilization—its group of islands being farthest from other lands of any in the world—it still does its part in passing on the lighted torch. In the labor of enlightenment it not only receives, but it confers; and it possesses and is rearing a race worthy of the best traditions of the countries from which it sprang.

BIRDSEYE VIEW OF HONOLULU.

Literature

The Law and Justice

THE arraignment of crying social or economic evils in fiction is no new thing. "Uncle Tom's Cabin" remains the most striking instance of its potency, with Charles Dickens probably in the second place. But the list may be extended almost indefinitely, both into the past and into the restless, vociferous present. Victor Hugo was sometimes maudlin in "Les Misérables," but he, too, succeeded in making his readers reflect as well as feel; Daudet raised his voice time and again in protest against social injustice. Zola, and our contemporary writers, whatever their nationality, are too fond of offering the universal cure — socialism — along with their exposure and protest. Tolstoy's later work is but frankly propaganda for his own essentially Slav Utopia; Upton Sinclair's "Jungle," the most productive of immediate results since Mrs. Beecher's protest against slavery, was, in the first instance, designed as a socialistic tract. The tolerant, ironic Anatole France alone, of present-day writers, has been artistic enough, and wise enough, to present to us without comment or explanation or panacea the dumb bewilderment of "Crainquebille," the Parisian huckster, brought face to face with the inhuman ways of the law, which is assumed to be the instrument of human justice.

Mr. Brand Whitlock adds to this fiction of protest his new novel, *The Turn of the Balance.** It is a book that will have weight with its readers, and influence. The many injustices of our method of administering justice are the subject of his tale, which takes us into the underworld of honest poverty and of crime, bringing us face to face, at certain significant moments of contrast, with the well protected, thoughtless upper crust. The whole machinery of the law, from the policeman to the judge on the bench and the jury in its room, is passed in review. What Mr. Whitlock tells us we all know, but he links it together in a chain reaching from top to bottom. The tyrannical, irresponsible power of the police, their venality and stupidity in their relation to the fostering of crime as well as its punishment are exposed; it is shown how criminal trials often become but a contest of skill between public prosecutors who seek convictions, and defending lawyers, whose only aim is acquittal, regardless of the truth and the justice of the case; the intelligence and conscience of juries have long been a byword and a jest; and justice on the bench, so Mr. Whitlock believes, is very human indeed, and errs often, sometimes because of influences more or less subconscious or direct.

One law for rich and poor we have in theory, says the author, but not one application of it to both. The poor man who takes a first false step is lost beyond reclaim. He is hounded into crime by the "watchful," vindictive policeman, and either pays tribute or is "railroaded" for offenses he may, or may not, have committed. The son of rich parents who goes wrong is protected by money, by legal talent, by influence, by his environment.

A serious book this, convincing even while one looks for the other side of the picture—one of the most striking of the many indictments of society of recent years.

Egyptological Researches

Prof. W. Max Müller, of Philadelphia, and Professor Breasted, of the University of Chicago, and Professor Reisner, of the University of California, are at present our only three American scholars of international repute devoted to Egyptology. They are all of them enthusiastic and productive students. Professor Müller has written mainly in German, altho now for a dozen years resident in America, and his name is familiar to readers of German Oriental journals. He represents his department in the work of the Carnegie Institution, and has made more than one visit of investigation

to Egypt. This volume* is the fruit of his first expedition. He devoted himself to the careful copying of inscriptions previously imperfectly copied or in danger of fading away or being destroyed by vandalism.

Prof. Max Müller had first gained reputation by his elaborate study of the references to Europe and Asia on the Egyptian monuments, and later by his fresh recension of the famous treaty with the Hittite king, so that it is natural that he should give especial attention to monuments that bear upon such foreign relations. Accordingly, he carefully sought the geographic lists by which the Pharaohs commemorated their Syrian victories and diplomatic connections. Most interesting for the history of art is his discussion, with photographs and colored drawings, of the earliest known representations of the Ægean or Mycenean art objects, the vases figured on the tomb of Sen-mut. The author insists, as against earlier authorities, that two of these beautiful vases are not earthen, but of silver and gold. He may be right, but the color does not make it certain. The Ægeans were admirable workers in metal, even at this early period, about 1500 B. C., as well as in ceramic art. We should not call the angular markings on the first of the vases carried as tribute on the shoulder, "rope pattern," as Professor Müller suggests. The rope pattern came considerably later, and was a simple abbreviation of the helix pattern shown on another of these vases, while this angular pattern is very early, if not archaic. The bucranion figured on one of the vases probably represents the long-horned aurochs, now extinct. On plate 40, a naos, with the figure of a Syrian deity on a lion, Max Müller follows Maspero's Catalog in calling the deity a god. The square hat usually indicates a goddess, as does the lion, on which, on plate 41, an indubitable Syrian goddess stands on a lion. The deity on plate 40 is not clearly bearded, and has weapons, but weapons might be carried by the goddess. These studies of Syrian deities are valuable for comparison with those on Syro-Hittite bas-reliefs and on seals. The majority of the plates, however, are copies of inscriptions, and ten of them are a fresh copy of the famous great list of what were originally 270 names of cities in Syria conquered by Thothmes III., with corrections of the copies of Mariette and Golenischeff. Four others cover the list of rebellious Palestinian cities punished by Rameses II. In this list, which was made before the Exodus, we have Jacob-El and Rosh-Kodesh, that is, Holy Headland, which may be the Head (*Rosh*) of Pisgah or Carmel. A new name found is that of Samson. Equally valuable are the eleven plates of the list of the biblical Shishak, of the time of Rehoboam. Max Müller is able to add some new names, as Jordan, and he thinks he proves that some of them indicate the existence of the Phenician alphabet, thus antedating by a century the evidence of the Moabite Stone. Two final plates will be of interest to physicians, as they give the first illustrations hitherto known, and the earliest, of Egyptian surgery. There is represented the opening of a boil in the neck, also operations on the foot and hand, and two cases of circumcision of youths on reaching the age of puberty. We congratulate the Carnegie Institution on being able to publish so valuable a volume.

* Egyptological Researches. Results of a Journey in 1904. *By W. Max Müller.* 4to, pp. 62; plates, 106. Washington: The Carnegie Institution. $2.75.

The Religious Value of the Old Testament

Now and then a book comes to light which seems to express with force and clearness that which others have stammered about, and which clears the air and dissolves the haze which has hung around a subject of much interest and importance. Such service is rendered to the question of the relation of recent criticism to practical religious faith by the brief essay* of Mr. Vernon, who for the past few years has been Professor of Biblical Literature in Dartmouth College and Pastor of the College Church, and has recently accepted an appointment to the Yale Divinity School to suc-

* The Religious Value of the Old Testament in the Light of Modern Scholarship. *By Ambrose White Vernon.* New York: Thomas Y. Crowell & Co. 90 cents.

ceed Professor Brastow. Mr. Vernon lays no claim to being an expert Hebraist, but he has certainly studied the problems of the Old Testament with conscientious thoroness, with painstaking use of the best literature, and with a singular faculty of discerning salient and significant facts and assembling details into a consistent picture. He is master of what the higher criticism has to teach concerning the development of religious faith in the ancient Hebrew people, and he has set forth the religious values embodied in the Old Testament with such intensity of enthusiasm that one wonders how he has held so well the even proportion of truth.

After a brief introduction describing the change of attitude on the subject, Mr. Vernon discusses the grounds on which the Old Testament was held valuable according to the older view. The book was thought to contain proof of the existence of God and of the divinity of Christ, and also to furnish infallible direction to the believer in all matters of faith and conduct. The author has fixt upon the real reasons why the former generations prized the Old Testament, and it is to his credit that he does not claim that the newer criticism will simply change a few notions as to dates and authors, but make no difference in essential doctrine. That important beliefs have lost support which once proved most helpful to them, thru the changed attitude toward the earlier portions of the Bible, is unquestionably true. The older view, however, was not in all respects profitable to vital religious faith, and Mr. Vernon has exhibited some of the disadvantages under which religion suffered from a mistaken conception of the Old Testament. He shows how the older view prevented sympathetic and truthful appreciation of the better elements of Jewish piety, and its real force and beauty. He demonstrates that the uncritical use of the book encouraged an external and mechanical type of faith, not so fresh, vital, and warmly spiritual as is nourished by the modern historical conception. With eloquence also he declares the larger, worthier God whom the newer studies set forth for men's reverence and devotion.

Mr. Vernon proceeds to show that the older view not only often leads to wrong ideas of piety, but that it is untenable on the basis of fact. He then takes up the task of making clear the grounds on which the Old Testament, as scholars understand it today, is so highly appreciated, and in this section of his essay the author's enthusiasm is most intense and his vision of essential religious truths most clear. He finds that the chief value of the Old Testament is in its men, and that in its "transcendent service in presenting characters that incite profounder reverence it is as enduring as virtue and is utterly independent of changing scientific and philosophical views." The characters chosen to illustrate this fact are David and Jeremiah, and Mr. Vernon's portrayal of these mighty men, who were so different in spirit and achievement, yet alike so genuinely brave and human, should be sufficient to convince the most obtuse of the value of critical studies. The treatment of these great personalities is sufficiently full for the author's purposes of illustration, yet one cannot restrain the wish that he had gone more into detail, with fuller discussion of difficult incidents and larger suggestion of the

PROF. A. W. VERNON.
Author of "The Religious Value of the Old Testament."

method by which the results were reached.

The second reason for high estimate of the Old Testament is found in the fact that "it records the discovery of our fundamental religious truths." That belief in the sovereignty of God and trust in the loving God were neither elements of an original revelation nor the possession of any imaginary "Natural Religion," but rather faiths which came slowly to realization in the souls of mighty men, Mr. Vernon makes clear by recital of the spiritual experiences of Amos and Hosea and by description of their contribution to the creed of humanity. That the religious appreciation of these truths is served by sympathetic contact with the men thru whom they first came to be, is a fact sufficiently clear on Mr. Vernon's pages.

The final section treats the relation of careful knowledge of the Old Testament to the correct understanding of the Founder of the Christian faith. Here the statement is that "it is as impossible to understand the purpose and spirit of Jesus without something of his reverence for the Old Testament and something of his intimacy with it, as it would be to understand a proposed amendment to a constitution without a knowledge of

HAWAIIAN GIRL OF THE OLD REGIME.
From Thrum's "Hawaiian Folk Tales."

the original constitution." The pages in which this striking statement is substantiated are again too few, but they are suggestive and marked by real insight.

To some this vigorous, enthusiastic appeal for higher estimate of the Old Testament on this basis of modern scholarship may seem radical, and its declarations of opinion unnecessarily assertive. The author is one who can write innocently of "the greatest evil of an infallible Bible," and some will be inclined to fling his book out of the window before they have read many pages. Nevertheless, the essay, in our judgment, is truly conservative, exhibiting in documents many have begun to question elements of permanent worth greater than those which had been sought for under the older view, and setting forth the indispensableness of the Old Testament to the larger faith of the days to come, and the reasons for thinking that its position as the first text-book in religion is fixt and permanent.

Hawaiian Folk Tales. A collection of Native Legends. Compiled by Thomas G. Thrum. Chicago: A. C. McClurg & Co. $1.75.

In the case of Hawaii, as of most other primitive communities submerged by civilization, we have to regret the irreparable loss of many of the native legends. When some are preserved, like fossil leaves indicative of a vanished type of life, it is difficult to estimate the degree of their purity. Of this collection some are obviously sophisticated and treated in a literary manner, others are crude and dry. It is, therefore, a book intended more for the general reader rather than the professional student of "the science of fairy tales." Most of the tales have been previously published in *The Hawaiian Annual*. The most interesting, from a literary standpoint, is the "Legend of Kanikaniaula and the First Feather Cloak," by Mrs. E. M. Nakuina. Among the other contributors are the Rev. A. O. Forbes, Dr. N. B. Emerson, J. S. Emerson, W. M. Gibson, Dr. C. M. Hyde and the compiler. The photographs of the localities to which the legends are attached add to the value of the book for the tourist or resident in Hawaii.

In Our Town. By William Allen White. New York: McClure, Phillips & Co. $1.50.

There are at least two country editors in the State of Kansas who have the spirit of the man who preferred to be the first citizen of a village rather than the second in Rome; they have resisted all temptations to bring their brains to New York; and Ed. Howe and William Allen White remain in Atchison and Emporia writing bright things which the metropolitan press is glad to copy, and enjoying the delights of life in a limited but loving circle. *In Our Town* is an album full of kodak snap-shots at the fellow-citizens of William Allen White, in Emporia. Sometimes he catches them, off-guard, in ludicrous attitudes and situations; he allows them no time for "making up" for their portraits, but tho he shows them to us just as they are, in everyday garb, and with no flattering concealments, we feel that he loves his fellow-townsmen well, and we, too, find them lovable. The young reporter with a sixth sense for sham; the society editor, Miss Larabee, with her woman's wit and loyalty to the paper; the lonely young man who constituted "the leisure class"; and the other pleasant faces on the pages of the album look at us out of wistful eyes we seem to have seen before; they are like "our own folks," these people who inhabit Mr. White's country town; and he writes of them, for the most part, tenderly and with sympathetic appreciation, tho not without a humorous twinkle in his eye at their peculiarities and patent absurdities, especially when these take the form of social shams. It is a clever and a wholesome book about people large and small who live in a little city.

A Midsummer Day's Dream. By H. B. Marriott Watson. New York: D. Appleton & Co. $1.50.

A *tour de force*, this, carried thru to the end with consummate skill. A masque, as the title indicates, the story is carried to great length, yet it never palls, because the author's spirits never lag, and his inventiveness never grows stale. Mr. Watson is a master of dialog that sparkles and amuses; he turns it, gives it grace and charm, yet never twists it violently for the sake of effect.

Add to this a romantic setting, an eighteenth-century formal garden, with its labyrinth, in the park of an English country house; imagine gathered there a merry company of well-bred amateurs rehearsing for an open-air performance of "A Midsummer Night's Dream," and add to this the adventurous search of the hero—Lysander—for the owner of a tiny slipper found by the side of a spring at midnight, and you have the ingredients of a comedy that will keep you entertained thru all of its 366 pages.

My People of the Plains. By Ethelbert Talbot, D.D. New York: Harper & Bros. $1.75.

The bishop of Central Pennsylvania was for twelve years missionary bishop of Wyoming and Idaho. Readers of Owen Wister's Western tales will recognize the bishop whom the cowboys approved; and the people whose confidence he won by a rare combination of tact, humor and devotion are the subjects of his book, *My People of the Plains.* It is a vivacious and veracious transcript of a fascinating stage in the evolution of the West, a life that is fast becoming a memory, and Bishop Talbot has rendered a service in preserving some of its more picturesque features and characters in his story. Many towns in his former diocese are no longer the ones he found twenty years ago, and in a very few years more the distinctive types of cowboy, miner and hunter will have disappeared forever. The "Newer West" is a most breezy and refreshing reality, but it is not *outré,* nor are its denizens grotesque. Hence these *genre* pictures have a value, historical and retrospective, as the only record we may have of a bygone social state.

Literary Notes

....MM. P. H. Eykman and Paul Horrix, whose joint article entitled "Internationalism and the World's Capitol," appeared in THE INDEPENDENT, July 26, 1906, have just issued the first number of their new *Review of Internationalism.* The magazine will be issued every other month in an English, French, German and Dutch edition, and is published at Amsterdam [New York agent, G. E. Stechert & Co., 129 West Twentieth street, New York.] The object of the *Review* is "to give an idea of all that has been done and thought in the field of Internationalism, but more especially of what still has to be done in the future." The idea of this magazine is a great and noble one, and as one of the signs of the times it is highly significant, but whether it is in the proper hands or not cannot be foretold from the first number.

....The March number of the *Kansas University Science Bulletin* contains the report of some interesting experiments by Prof. Marshall A. Barber on heredity in bacilli and yeast. He finds that unicellular organisms like larger and more complex plants form mutants or sports, and by picking out a single eccentric cell with a microscopic pipette and starting a colony with it he is able to obtain new and permanent races, in some cases capable of competing with the parent stock and more resistant to unfavorable changes of environment. This may explain the sudden changes in the virulence of disease which often perplex the physician in an epidemic.

....*The Philippine Journal of Science,* which has been issued in monthly numbers during the past year, and has comprised papers on all the lines of scientific investigation conducted by the Philippine Government, will be divided for 1907 into the following separate publications, not to be issued at stated intervals: (a) *General Science,* including papers on chemistry, geology and mineralogy, zoölogy (including entomology and ornithology), and a series on ethnological and ethnographical subjects; (b) *Medical Sciences,* devoted to tropical medicine. studies in bacteriology, pathology, and work on serum production and therapy; and (c) *Botany.* Subscriptions will be received for the separate series, or for the publications as a whole. The Macmillan Co. are New York agents.

....*Second Report of the Wellcome Research Laboratories at the Gordon Memorial College, Khartoum.* By Andrew Balfour, Medical Officer of Health. Published by Department of Education, Sudan Government, Khartoum. It is barely twenty years since Gordon lost his life at Khartoum, and most of us are not apt to associate the name of the city with advances in science, and, above all, sanitary science. The recent volume, however, like its predecessor, the First Report, gives ample evidence of some of the best medico-scientific work with regard to the conveyance of disease by winged insects that is being done anywhere in the world. Libraries that make a feature of collecting the results of original investigation in medicine cannot well afford to be without it. Those who are interested in the various parasites of man or in tropical diseases will find it full of precious suggestive information. The staff of the laboratory are certainly to be congratulated, and the civilized world is being put under a distinct obligation by the work of these men who are making large portions of the globe, previously uninhabitable because of various infectious diseases, not only livable for the white man, but actually able to afford him opportunities for reasonably happy existence under what have been deemed up to the present time as impossible conditions.

Editorials

More Railway Regulation

It is known that in his study of railway questions the President has become deeply interested in the relation of stock and bonds to the value of the railway property upon which they are based, or to the sums actually invested in this property. This question is one which involves overcapitalization and stock watering, and, possibly, an appraisal of the property by Federal authority. Some weeks ago, owing to the expressed anxiety of some persons as to his purposes, he permitted it to be known that he had in view no recommendation for legislation that would disturb existing securities, but that his policy concerning this matter related to issues of securities in the future. It is now asserted by journalists who have enjoyed his confidence that his views with respect to overcapitalization and an official appraisal will be made known by himself in an address on the 30th at Indianapolis.

There was no direct reference to this subject in his remarks at Jamestown last week, but it is probable that he had it in mind when he said:

> "It is our business to put a stop to abuses and to prevent their recurrence, without showing a spirit of mere vindictiveness for what has been done in the past. . . . We are unalterably determined to prevent wrongdoing in the future; we have no intention of trying to wreak such an indiscriminate vengeance for wrongs done in the past as would confound the innocent with the guilty. Our purpose is to build up rather than to tear down."

This was in accord with what was said at the White House, "by authority," concerning his views about overcapitalization when he replied, on the 2d ult., to the invitation from the Illinois Manufacturers' Association.

Owing to current reports that he is soon to express his opinions on the subject, certain recent events and utterances become quite interesting. It is asserted, and also denied, that John F. Stevens, formerly Chief Engineer of the Panama Canal, has been employed to make a valuation of the physical property of the New York, New Haven & Hartford Railroad Company, as a kind of experiment that may test the wisdom of the President's policy. On the 22d ult., a committee of the Minnesota Senate submitted a long report as to the value of the property of the railroad companies owning lines in that State. The committee estimated the value to be $215,000,000, or about $27,000 per mile on an average, while the capitalization is $400,000,000, or about $50,000 per mile. One company, the Chicago Great Western, was severely criticised. In this case the average value per mile was said to be $28,000, altho the capitalization per mile, in stock and bonds, was $143,668.

At a meeting of three hundred railway officers in Pittsburg last Friday, an address was made by Melville E. Ingalls, a prominent and successful railway man, formerly president of the Cleveland, Cincinnati, Chicago & St. Louis Railroad Company, and now chairman of its board. Said he:

> "You must have legislation providing that no new railways shall be built or new stock or bonds issued, except with the approval of the Interstate Commerce Commission. I know this will cause a storm among some railway promoters, but, gentlemen, you have got to submit, and you might as well make up your minds now that you are no longer a private industry. He who is not prepared to manage his railway as a public institution, in accordance with law, should resign and seek other business."

Such approval of future issues by the Commission is, we are told, a part of the President's plan. This veteran railway financier and manager not only foresees that it will be required, but also believes that it is demanded in the interest of the railways and the public.

But this was not all that Mr. Ingalls said in what must be regarded as one of the most remarkable public addresses of these days. He narrated the history of the consolidation movement which culminated in the Northern Securities Company. Securities of the roads, he said, had drifted to Wall Street and "were controlled by cliques who used them perhaps not for investment so much as for counters in the great game of speculation

they were playing." "Some six or seven of these men" conceived the idea that they would buy a controlling interest in practically all the roads, and thus by joint ownership cause a maintenance of rates. They quarreled among themselves, "the skeletons in their closets were exposed to the public," and the Government sued for a dissolution of the Northern Securities combination:

"If it had not been for that suit, a few men would have controlled the great transportation interests of this country. While they would have maintained rates, they would have made and unmade statesmen, would have controlled Congress and Legislatures, and no one knows what the result would have been."

After the decision of the courts, he continued, these men would not accept the situation, but sought to avoid the decision by subterfuges. He himself urged that the railways should join in with the people and obtain legislation fair to both. "But the railways had not then learned that the people were supreme and that they had better bow to the inevitable." In 1905, they persisted in their unwise course and were beaten again:

"The end has come. There are to be in the history of this country no more secret contracts, no more rebates, no more free transportation.

"You cannot settle the condition of the railways by running to Washington and claiming the protection of the President. I admire the stand taken by the president of the Pennsylvania Railroad, when he said he had no cause to go to Washington to confer with the President—that his company desired to obey the law. This is what all the railways must do—submit to the law.

"It will not do to have forty-six States passing forty-six different acts. So far as possible, all legislation in reference to rates should be left to Congress.

"You must have legislation giving you authority to make agreements among yourselves which can be enforced. But these agreements must be public and must be passed upon by the Interstate Commerce Commission.

"The Commission must be strengthened. It should be enlarged, and the salaries of its members should be increased."

It is refreshing to see a veteran railway chief, still in harness, so clearly reading the signs of the times. If there be any plot of the reactionaries to prevent by political intrigue a just regulation of the railways, those who have made it will get no help from Mr. Ingalls.

The Middle of the Pacific

We are very fortunate this week in being able to give our readers a very valuable series of articles about our new Hawaiian possessions. We need add nothing here as to the worth of these Islands to us, or as to their importance as the halting place for all commerce which must cross the Pacific Ocean. That commerce has but just fairly begun. In a hundred years the Pacific commerce will equal or surpass that which crosses the Atlantic. San Francisco or Seattle will be as large a city as New York. Then Hawaii will hardly be large enough to find room for all the steamers that must stop in its ports. The country which holds Hawaii will hold control of all that commerce.

We are very glad to learn that our Congress made no mistake when it insisted on universal democratic suffrage for the Islands. The wise men of Hawaii doubted. They would have restricted suffrage to the educated and the well-to-do; but with no small courage we said that we must trust the people at all hazards. The hazards seemed too great for a few years; but now the wise men tell us that the native Hawaiians are just like other people, amenable to the teachings of experience, lovers of honesty, and that an honest government is now achieved. They are poor ethnologists who imagine that only Anglo-Saxons can become fit to rule the world.

So we pass from these matters, so fully argued by our Hawaiian contributors, to ask a question which not one of them has here raised, but which one of them, Dr. Sereno E. Bishop, an authority on volcanoes, has elsewhere asked and answered—Where did the Hawaiian Islands come from? How came they there, left alone, in the middle of the great Pacific?

That carries us back many millions of years. What is the cause of the deep hollow of the Pacific Ocean, which covers half the globe? One likely answer is, that when, in the course of the evolution of our solar system, the moon separated from the earth, flew off from it, it escaped from that side of the earth where now is the Pacific Ocean. Then,

say some astronomers, the outer crust of the earth had begun to harden, the equator bulged much more than it now does, and the velocity of revolution was much greater than now, and the separation of that portion of the earth which has made the moon caused the first great breaking up of the earth's crust and raised the great Eastern Continent opposite the hollow left to be filled by the waters of the Pacific, while a portion of the crust that remained broke off from Asia and moved westward to form the American continent.

The specific gravity of the rocks on the surface of the earth averages about 2.7, while that of the total earth is as high as 5.6. This shows that the lighter portions of the earth are near the surface, and the heavier are toward the center. Now, the specific gravity of the moon is 3.4. When the moon was flung off from the earth, at a time when the earth's shape was much more ellipsoidal, and it was revolving in four hours instead of twenty-four, the centrifugal force which threw off the material of the moon must have taken a considerable portion of the lighter crust, and not a little of the heavier portion below it, so as to bring up its specific gravity to 3.4. Now, to return to Hawaii, we find that the specific gravity of the upper part of the mountain, Mauna Loa, is 2.1, while that of the lower part is 3.7. This may be explained from the fact that this material comes from the lower level of the crust of the earth, left under the ocean when the moon escaped, while the upper portion comes from volcanic scoria. The volcanoes of Hawaii are caused by the thinner crust of the earth under the ocean, just as those along the edges of the continents are due to the cracks in the breaking of the strata that had their first origin when the continents were created by the pushing and crowding and moving of the crust of the earth when the moon was flung off.

The authority for this theory of the origin of the Pacific Ocean is our most distinguished astronomer, Prof. W. H. Pickering, of Harvard Observatory, who in these conclusions develops the researches of Prof. George H. Darwin, and whose discussion may be found in a late paper entitled "The Place and Origin of the Moon." Just now it interests us for Hawaii's sake. It has been flippantly remarked that it must not be suggested that, because the moon came from Hawaii, the people of those Islands are lunatics, for all the lunacy was carried off, and there was left only what is sane.

A Right or a Charity

If socialism should ever be established as a practical reality, the peculiar mental operations of some Deep Thinkers who are now opposing it will have contributed something to the result. The lectures of Mr. Mallock were a pretty fair offset to the defeat of municipal ownership and Mayor Dunne in Chicago, but as a socialistic missionary Mr. Mallock is an amateur in comparison with what the Hon. Jacob W. Mack might be if he were to devote himself seriously to the business.

Mr. Mack, we may explain to those who may not know about it, is chairman of the Committee on Education of the City Club of New York City, and he "has a concern," as our Quaker brethren would phrase it, about the proposition to provide eyeglasses for school children whose eyesight is defective. He acknowledges that a serious evil exists, and admits that the Board of Education ought to see to it that defects of sight and hearing, adenoid growths and other physical troubles that interfere with mental growth are, as far as possible, cured before children suffering from them are put thru the school machinery. "But it is an entirely different matter," Mr. Mack protests, "to alleviate any of these conditions at the expense of the municipality. This smacks of socialism, of a paternalism which is threatening to creep into our political system, and which should be strenuously opposed."

Of course there is only one way in which the Board of Education can provide eyeglasses, surgery, and so on, for children whose parents are unable to pay for such things if the municipality may not be called on to pay the bill. Private charity must be appealed to, and Mr. Mack accepts the alternative. He says:

"Let it be made known that there are so many children who need eyeglasses and whose

parents are unable to furnish them (others should be compelled to), and I have no doubt that the needed eyeglasses will be provided promptly, without difficulty, and without calling upon the public treasury."
